SHAPING METALS BY ELECTRICITY.—Mr. Herman Lemp has patented a device for forming or shaping pieces of metal when rendered soft or plastic by an electric current. In carrying out the invention it is proposed to use a transformer provided with a secondary of very low resistance, so as to produce a current of great heating volume. The terminals of the secondary are brought adjacent to each other and provided with clamps, one of which is arranged to slide to or from the other. The piece of metal to be operated upon is secured by the clamps at its ends, and the primary circuit of the transformer thrown into connection with an alternating current circuit. The bar of metal is soon heated to plasticity, when the sliding clamp is withdrawn, thus rupturing the metallic bar being operated upon. A die is then placed over the plastic ends of the bar and the sliding clamp is forced inwardly so as to drive the heated ends of the bar against the face or faces of the die, thus producing a swaging action on the softened metal and causing the same to assume the form of the die. The advantages claimed for this invention are great expedition of manipulation.

NOVEL GERMAN INVENTION.—A Berlin inventor has devised an elevator which is said to be simple and inexpensive. It is described as follows: It is on the principle of an inclined railway, and the motive power is furnished by water, which is applied in the cellar; each flight has its separate chair, so that, for example, one person can ascend from the first to the second story while another is on his way from the second to the third, or still another is descending from the fifth to the fourth. The chair, being only the width of the human body, requires but little space, and still leaves a free passage for any who wish to walk up or down instead of riding. It is set in motion by a simple pressure upon one of its arms, while after it has been used it glides back to the bottom step, its descent being regulated in such a manner that the carrying of a passenger is a matter of entire safety. The motive-power is, of course, more or less expensive, according to the cost of water.

HARD AND SOFT EMERY-WHEELS.—Hard, close grain emery-wheels do not cut so rapidly as soft, loose ones, from the fact that the particles in the hard stone are more compact, and the edges wear slightly before breaking, while in the soft wheel the cement wears first, and more rapidly, presenting new cutting edges to the work, which, when but slightly worn, will pull out of the wheel on account of this increased friction surface, freeing sharp edges replacing them. This is proved by the fact that the fastest cutting wheels are the softest.

CRUSHED STEEL.—This material is said to be coming into use for cutting stone. It appears to be made by quenching very high-carbon steel in cold water from an excessively high temperature, such as would overheat steel for most purposes. This renders it not only hard but rather brittle, so that it is possible to pulverize it; it is crushed in a stamp-mill and sifted closely to size. It is said to be not only cheaper but much more effective than emery, giving a better and quicker polish and lasting much longer.

HEAVY LOCOMOTIVES.—The Baldwin Locomotive Works of Philadelphia have recently completed, or are now building, locomotives weighing 75 tons each for the Northern Pacific and other railroads. The only obstacle to the immediate introduction of these engines on many roads is the insufficient strength of the bridges.

SCIENTIFIC PROGRESS.

Photographs and True Art.

The Washington *Post* says that the instantaneous photograph bids fair to become a very potent aid to artists who seek to teach their pupils that reproduction is not art; for it is clearly demonstrated by this means that the real is in nowise like the apparent. For example, an instantaneous photograph of a man in the act of running never looks as much like a man in the act of running as the pen drawing of a true artist does. The reason is that the photograph reproduces the one exact position of the runner at the instant the picture is made, while the artist pictures several positions in one and makes his man appear to be moving. Art always has dealt and always must deal with things not as they are, but as they seem to be. We sit and look at a runner. He seems simultaneously to bend forward his body, throw one leg away forward and the other far to the rear, with both knees at almost an acute angle. At the same instant he seems to swing one arm forward while the other is drawn back, both being "shut" tightly at the elbows. So it seems, for the eye of the observer is not keen enough to see the position of each instant separately; it sees the position of a group of instants, and the observer thinks that these positions are simultaneous. The instantaneous photograph shows that they are simultaneous, and in doing this presents a picture that does not look like a man in the act of running. This photograph is going to be—indeed already is—a great aid to science, but the only thing it can do for art will be to prove that really it does not seem as true as the ideal. What is true of the painter's and the sculptor's art is also true of the writer's. He who describes things as they really are may be a scientist, but only he who describes things as they seem to be is an artist. We frequently hear readers say of characters created by an artistic writer that they have seen just such persons. They think they have, but they haven't. It is the writer's art that makes them think they have. If he actually described the persons they have in mind they would say there never were such beings on earth. Thus it comes about that "truth" (reality) is stranger (because less commonly observed) than fiction, and that "fiction (the ideal) hath a nobler end than fact."

Double Stars—The Star Mizar.

Every observer of the heavens is familiar with the constellation called the Great Dipper, visible in the northern sky through the whole night and throughout the year. An interesting discovery has recently been made by Prof. Pickering, of the Harvard University observatory, concerning one of the stars of this beautiful group. It is the middle star in the handle, and is called Mizar, is of the second magnitude, and has attracted much attention because even to the naked eye it is double. It has a companion, Alcor, which is of the fifth magnitude, and is plainly visible to observers endowed with good visual power. The tiny star seems to be growing brighter, for the Arabians considered it a severe naked-eye test, and it is now comparatively easy to detect. The telescope shows plainly that Mizar is a double star, its components being of the third and fifth magnitudes, the one a brilliant white, the other a pale emerald.

The recent discovery of Prof. Pickering is the fact that the larger star of the pair is also double, the two stars that compose it being so close together that the telescope cannot separate them.

The Spectrum of a Star.

Like the solar spectrum, consists of the seven primary colors, crossed by dark lines. These lines form a kind of astronomical alphabet. If the star is coming toward us, they shift toward the violet end of the spectrum. If the star is receding, they shift toward the red end. Two stars very near together, having the same spectrum, cannot be distinguished from a single star as long as they are at rest. If they revolve round each other in a plane inclined to the line of sight, the lines of their spectra will be single when the stars are in conjunction and double when they are at elongation. This is the case with Mizar, and the doubling occurs at intervals of 52 days. Prof. Pickering, therefore, infers that these two stars are immense suns revolving round each other. He estimates that the period of revolution of each sun about the common center of gravity is 104 days, and that the maximum velocity is 100 miles a second. These conclusions are the result of measurements of almost inconceivable delicacy.

FIRE FROM STEAM PIPES.—In an article on the danger of fire from steam pipes in a German paper, it is said that after wood has remained a long time in contact with steam, hot-water or hot-air pipes, the surface becomes carbonized, and during warm weather the charcoal absorbs moisture. When the moisture is driven off, it leaves a vacuum into which the fresh-air current, circulating around the pipes, rapidly penetrates and imparts its oxygen to the charcoal, causing a gradual heating and eventually combustion.

THE ADVANCEMENT OF SCIENCE.—The 39th annual meeting of the American Association for the Advancement of Science commenced its session at Indianapolis on the 20th instant. Over 200 members were present, in addition to a great number of interested visitors. The Governor of the State, most of the State and city officers, and the members of the Indiana Academy of Science were in attendance. This association has met with a rapid growth, and is regarded as one of the most active and useful associations for the advancement of science in existence. It grew out of an association of American geologists and naturalists which was organized 50 years ago in Philadelphia. The scope of that association was enlarged and its name changed in 1849, so as to embrace work in all departments of science. At its reorganization its membership was only 461, which number grew but slowly for 20 years, numbering only 668 in 1871. Since that time the growth of the society has been much more rapid. It has now an enrolled membership of something over 2000, of whom fully one-half will probably be present at some time during its present session. The association is divided into eight sections, devoted to as many specialties. Prof. Goodale of Harvard University is president for the current year. Up to this present writing we have seen no report of any of the papers read, of which no less than 200 are expected to be presented.

THE BUSINESS OF PACKING is gradually being reduced to a kind of scientific form, including not only the careful and proper manner of putting up packages, whether large or small, but also their handling, transportation and delivery. It has been found that steamers will carry some 20,000 packages, as they generally run—boxes, barrels, crates and baskets. Much study is being given to the most close connection of ship and car. There is probably no port in the world where this business is closer studied than at Baltimore, where, in addition to freight cars and steamers, there are innumerable wagons on land and flotillas of little craft in the water. Schooners of from 300 to 400 tons, sloops of from 30 to 40, are continually arriving with oysters in winter or with vegetables in summer. The dock workmen and most of the dock hands are colored. Norfolk and its environs furnish employment for 30,000 men in this industry during the busy season.

THE GREAT ANTIQUITY OF WEAVING.—An examination of the textiles from the German peat-finds of the northern bronze period has enabled Herr Buschan to distinguish the fibers of the stuff, and to show that, at a period of great remoteness, wool and flax, but not hemp, were made into webs. The folk of the lake dwellings could manufacture flax into coarse lace, nets, mats and even embroidery. Herr Buschan holds it proved, by the instruments discovered, that they could knit and weave in the Neolithic period, when mighty mammoths were roaming over Europe, and when England harbored the musk ox and grizzly bear.

A NEW ALUMINUM PROCESS.—M. Minet has placed before the French Academy of Sciences a process of extraction of aluminum by electrolysis of a fluoride of this metal in a molten state. He employs an electrolytic bath composed of chloride of sodium 60 grammes, double fluoride of aluminum and sodium 40 grammes. He gives various details of the method of procedure. He produces by this method 21.5 grammes of aluminum for an expenditure of one-horse power hour, and 30 grammes might be obtained in actual practice.

GERMS OF CHOLERA INFANTUM.—Dr. Vaughan of the University of Michigan, who gave to the world his discovery of tyrotoxicon—the poison which exists in milk, cheese and ice cream—claims now to have isolated three poisons which were obtained from the germs of cholera infantum. Both this disease and typhoid fever are, he announces, due to alkaloid poisons, which are of the nature of ferments; and he will now devote himself to discover antidotes for them.

BUANDERINE is a new lixiviative which has made its appearance on the German market, for washing and cleaning linen goods especially, and great things are claimed for it, but whether the claims are substantiated is somewhat uncertain and very doubtful, to judge from its composition, which is given in a contemporary as 53 59 fatty acid, 12.25 paraffine wax, 7.58 soda, 1.26 alkaline sulphate, 24.96 water.

PHOTOGRAPHING THE FORMATION OF WATER DROPS.—An instrument has recently been exhibited in London by which a photograph can be taken of drops of water in the course of their formation. It consists of a lantern and lenses, by which a water-trough, the source of the drops, can be strongly illuminated, together with a lightning camera having a revolving-disk with one perforation.

ELECTRICITY FOR THE EYES.—A Portland, Or., jeweler is said to have invented a device consisting of copper and zinc adjustments to the temple of spectacles, and to the nose-piece of eye-glasses, whereby a small current of electricity is generated, materially assisted by the moisture of the skin. It is claimed that this current will strengthen the optic nerve.

A NEW ELEMENT, named "damaria," is said to have been discovered in the crater of an extinct volcano in Damaraland. It is reported to have an atomic weight of only 0 5, or half that of hydrogen, and therefore it is the lightest known substance.

Good Health.

The Kemmler Execution.—Much unfavorable comment has been made in the papers in regard to the Kemmler execution. These comments are no doubt largely due to the supposed degrading innovation which such executions may possibly engender in the minds of oversensitive persons. Such objection is senseless. The supposition on the part of some persons that the death of Kemmler was prolonged and highly painful is without reason. His taking off was without doubt instantaneous and absolutely painless. The physical distortions manifested were purely muscular, and may be produced in the same way upon any cadaver, as is well known to all medical men. If the current had been kept up for a few seconds longer, no such indications would have occurred, unless the current had been turned off and then turned on again, which would have been an unnecessary thing to do. The current should have been passed through the body by way of the two hands properly moistened and secured in the circuit. Everything about that execution, when properly considered, shows that it was certain, humane and in every way proper. It has proved that the traditional and barbarous gallows should be consigned to oblivion.

Mistakes.—It in a mistake to labor when you are not in a fit condition to do so; to think that the more a person eats the healthier and stronger he will become: to go to bed at midnight and rise at daybreak, and imagine that every hour taken from sleep is an hour gained; to imagine that, if a little work or exercise is good, a violent or prolonged exercise is better; to conclude that the smallest room in the house is large enough to sleep in; to eat as if you had only a minute to finish the meal in, or to eat without an appetite, or to continue after it has been satisfied merely to please the taste; to believe that children can do as much work as grown people, and that the more hours they study the more they learn; to imagine that whatever remedy causes one to feel immediately better (as alcoholic stimulants) is good for the system, without regard to the after effects; to take off proper clothing out of season because you have become heated; to sleep exposed to a direct draught; to think any nostrum or patent medicine is a specific for all diseases.

What is True Life?—The mere lapse of years is not life. To eat, and drink, and sleep—to be exposed to darkness and to light—to pace round in the mill of habit and turn thought into an implement of trade—this is not life. In all this but a poor fraction of the consciousness of humanity is awakened, and the sanctities still slumber which make it worth while to live. Knowledge, truth, love, beauty, goodness, faith, alone can give vitality to the mechanism of existence. The laugh of mirth that vibrates through the heart, the tears that freshen the dry wastes within, the music that brings childhood back, the prayer that calls the future near, the doubt which makes us meditate, the death which startles us with mystery, the bardship which forces us to struggle, the anxiety that ends in trust, all these are the true nourishment of our natural being.—*James Martineau.*

Marriage with Drunkards.—The efforts to raise the poor and degenerate inebriate and his family are practically of no value as long as marriage with inebriates is permitted. Recently the Legislature of the State of Victoria, in Australia, has passed a law which gives a wife the right of divorce if the husband is found to be an habitual drunkard. If after marriage she discovers that he is an inebriate, she can also get a divorce. The husband can do the same with a wife if she is proved to be an inebriate. This is a clear anticipation of the higher sentiment which demands relief from the barbarous law which would hold marriage with an inebriate as fixed and permanent.

For Sleeplessness.—It is claimed that the most potent and most perfect remedy for sleeplessness is to drink hot water. If one awakens in the night, as hopelessly wide awake as if galvanized or electrified with vital activity, an invariable remedy is a glass of perfectly hot—not warm—water. It can be heated over the gas, or over a spirit lamp, and sipped while almost at boiling heat, and one who tries it will find himself going off to sleep like an infant, and getting, too, the most restful and peaceful sleep imaginable.

Palpitation of the Heart.—Dr. Nebo (in *Journal de la Sante*) says that an excessive palpitation of the heart can always be arrested by bending double, with the head downward and the hands pendent, so as to produce a temporary congestion of the upper part of the body. In almost all cases of nervous or anemic palpitation, the heart immediately resumes its natural function. If the respiratory movements be suspended during this action, the effect is only the more rapid.

Heart Disease from Over Exertion.—A warning against undue physical exertion by those not accustomed to it is contained in the remark of the chief surgeon of the National Soldiers' Home at Dayton, Ohio. This physician said that of the 5000 soldiers in the home "fully 80 per cent are suffering from heart disease in some form or another, due to the forced physical exertions of their campaign."

Engineering Notes.

New Route Across the Atlantic.—An Ottawa, Can., dispatch states that a company of Boston, Mass., capitalists have been quietly developing the foundations of a seaport at the east end of the Straits of Canso, N. S., and if expectations are realized it will have an important bearing upon future communication between Europe and America. The place, which is to be called Terminal City, is five miles east of Port Muigrave, on the Intercolonial railway, and the Government has consented to an extension of the railway to the place, and agreed to operate the extension as part of the Intercolonial system. Terminal City is situated on one of the finest harbors on the Atlantic Coast, having sufficient depth of water for the largest vessel afloat, being completely land-locked, absolutely free from ice, comparatively free from fog, and open to navigation at all times. A straight line on the map of the world from Chicago to Liverpool passes through this point, and the distance between them is 400 miles shorter than by Portland, Boston or New York. It will take four days from Terminal City to Liverpool by the new steamers proposed to be put on the route. When the railroad is completed and wharves are built, all passengers and mails from Europe will be delivered in New York or Montreal one day sooner than by any other route. It is the most easterly port, open all the year round, and appears to be a natural shipping port for the products of the Dominion to Europe.

High Rates of Speed.—That eminent scientist Prof. Elihu Thomson, in a recent lecture before a scientific body, declared that much higher speeds than can now be obtained with steam locomotives are to be expected by means of electricity, and he considered from 100 to even 150 miles an hour possible. He gave as a reason for this opinion the fact that while in the steam locomotive there are reciprocating parts that must be put in motion, stopped and reversed continually, in the electric locomotive we have simply a rotary motion, which makes it possible to run with economy at much higher rates of speed. He believed that if we could come back after another hundred years, we would find 150 miles an hour to be the speed of traveling, adding: "It simply depends upon finding the necessary method of applying sufficient power, and building the locomotives to suit, arrangements being adopted to keep the cars on the track." One hundred and fifty miles an hour may be among the possibilities, but probably most people nowadays would rather leave to coming generations the enjoyment of whirling through space at that frightful velocity. To leave Chicago at night and be in New York next morning would be a wonderful achievement, involving great increase of business facilities, but the safety of such a speed under present conditions may well be questioned.—*Railway Age.*

Rope Transmission of Power.—The utility of wire-rope transmission has become widely recognized. Not only among the rugged hills and mountains of the East and Far West, where streams go rushing down through caverns and rocky steeps, where no locations for mills or factories are afforded, is this means of transmission of precious power appreciated, but it is so convenient to use it that we find on the prairies of the West mills being operated at a long distance from water-powers by the wire rope. A few days ago, on a trip through Nebraska, we noticed a rope stretching for nearly a mile from a water-power to a mill that had recently been built adjoining a railroad, the owners finding it much more to their advantage to have it there, with the switching privileges afforded, than at the dam. The expense of hauling the flour which is thus saved to them will very soon pay for the system of power transmission.—*Modern Miller.*

A Novel Proposition.—A correspondent of *Indian Engineering* suggests an original scheme for smoke abatement, by asking whether it has ever been proposed to have a smoke duct running through a town, connected with the different furnaces. He suggests that such a duct might be carried outside of the city to a condensing station; an exhaust machine being employed to force the draught. At the condensing station the soot-laden air might be made to pass through water, and thus deposit the solid matter, the air passing away comparatively pure, while the soot thus deposited might easily be collected, caked and sold as fuel. The size of the duct would have to vary, as in water and other mains, according to the work to be performed.

The Manchester (Eng.) Canal, that is to give the great manufacturing city an outlet to the sea, is a gigantic undertaking. There are in use 97 steam navvies, 169 locomotives, 245 steam cranes, 130 portable engines, 211 steam pumps, 6162 wagons, 52 pile-driving engines. The steam-power amounts to 50,000 horse-power; 12,000 men and boys are employed and 160 horses; 30,000,000 cubic yards of excavation have been made, and forty-four millions of stone and earth yet to be moved.

Permission to Establish a Cable Railway on Broadway, New York, has been granted by the State Railroad Commission. The company is to repave and keep in repair the space between its tracks and for two feet each side. Grooved rails must be used as soon as possible, but permission is granted to lay tram rails temporarily, until the grooved rails can be obtained.

An Immense Traffic.—The Southeastern Railway, England, is reported as running 800 trains each 24 hours in and out of Cannon Street station, London.

Useful Information.

Utilizing Tin Cans.—The *American Analyst* gives an insight into a rather peculiar industry, the utilization of old tin cans in New York City. It says: Large numbers of tin cans of all kinds in which foods have been contained find their way via the ash barrels to the city garbage dumps. Here they are picked out and taken to a tin-can receiver, where, after the labels and dirt are washed off, the tin and solder are melted and converted into solder sticks, the remaining sheet iron being rolled flat and sold for trunk corners, umbrella ferrules, and the scrape are converted into such weights. There is no secret about the process. The only thing is to have a proper-sized furnace and to get up a sufficient heat. The business has developed of late, but manufacturers say the margin of profit is small. It costs more to melt the scraps than common iron. Chips ready for the furnace cost $7 a ton. The cash weights produced are of a superior quality. The business is, like the case of old rubber, an illustration of the use of waste material. The tin-can companies and other manufacturers of tin goods formerly dumped hundreds of tons into space, but now these scraps are utilized, and the irresponsible small boy works the ash-fields to his profit, in companionship with the blithesome goat.

Shingles, Hips and Valleys.—Shingles in valley and on hips last longer when laid with their grain running in the same direction as that of the hip or valley. When they are out on the angle, the end wood absorbs water and hastens rot, whereas the straight, close-running grain of the wood rejects the moisture more and leaves the shingles more durable. Few carpenters can now be found, except among the older hands, who are familiar with this mode of shingling, as it really is a very old yet excellent one, and yet comparatively simple, involving little or more time than the late and inferior method. All that is necessary is to taper the shingles so that they radiate, as it were, from the angle of the hip or the valley to straight joint square to the eave. Combs on ridges are scarcely to be recommended, but if they must be employed for the sake of economy, are best run up on that side on which the angle of the rain in that latitude generally falls. Wooden ridge rolls are better, and best of all is the galvanized iron cresting. Rolls and ridge boards should be nailed through the shingles and into the rafters, and not to the shingles only. Hip shingles should be cut with a saw to make a job straight.—*Journal of Building.*

The Multiplying Uses of Iron.—Iron is the gauge by which the prosperity of this country is measured to a great extent—when the price of iron is in the ascendency the country is enjoying prosperity. The great rolling-mills of the West, that a few years ago were turning out tons of steel rails every hour, are heard of no more. They are supplanted by the great foundries that are turning out hundreds of tons of castings daily for the great office buildings and stores that are now being erected in large cities. To the ordinary beholder these buildings are built of stone, brick, terra-cotta and glass, but in fact the entire skeleton is of iron or steel and all other materials are merely masks with which to clothe the monster, the buildings being constructed on the principle of a latticed girder or braced tower. The brick or stone work shown is a mere shell or architectural veneer to give the building a resemblance to its neighbors. As we are apparently only at the beginning of this new era in architecture, it is probable that the demand for iron and steel for these monster buildings will continue at an increasing rate.—*St. Louis Builder.*

Manufacture of Celluloid.—The substance known as celluloid consists usually of dissolved paper, although cotton or other vegetable fibers may be used. In the manufacture, tissue paper is treated with nitric and sulphuric acids, the product is then washed and camphor added. The mass is then ground. Coloring matter is now added and the mass is made into a paste with alcohol; it is then pressed and broken between rolls. The finished mass is very plastic and may be molded and pressed into any desired shapes, drawn into tubes, etc. All the celluloid articles sold in the United States, and in fact the bulk of all that are sold the world over, is the product of an American company's factory. The output of the company last year was valued at $1,500,000.

Charcoal.—The best quality of charcoal is made from oak, maple, beech and chestnut. Wood will furnish, when properly charred, about 20 per cent of coal. A bushel of coal from hard wood weighs 30 pounds; 100 parts of oak will make 23 of charcoal; red pine, 22.10; white pine, 23.

The Growth of Canada.—The population of Canada is estimated at 5,000,000, an increase of nearly 700,000 in ten years. A hundred years ago the population of the United States was 3,929,000; of Canada, 156,000. In 1861, British Columbia had 6000 people; in 1881 the population was 49,459. These figures show that Canada has grown proportionally at a faster rate than the United States. She has increased 32 fold, while the United States has increased only 16.

To Remove the Smell of Paint.—The best way to remove the smell of paint is to first render the room as nearly as possible air-tight by closing the windows, doors and other openings. Place a vessel of lighted charcoal in the room, and throw on it two or three handfuls of juniper berries. After 24 hours the smell will have entirely disappeared. Another method of doing the same thing is to plunge a handful of new hay into a pail of water and let it stand in the newly painted room.

The First Mechanical Invention.—On Thursday, July 31st, occurred the one-hundredth anniversary of the issue by the United States Government of a patent for a mechanical invention. The patentee was Samuel Hopkins, for a process for making pot and pearl ashes. The number of patents issued during the first century of the nation's existence was 433,432, and still they multiply.

Gilt Picture Frames may be brightened by taking sufficient flour of sulphur to give a golden tinge to about one and one-half pints of water, and in this boil four or five bruised onions, or garlic, which will answer the same purpose. Strain off this liquid, and with it, when cold, wash with a soft brush any gilding which requires renewing, and when dry it will come out as bright as new.

Whale Glue is a new article of commerce. It is being manufactured on the Russian island of Jeretike, from the jelly remaining on extracting the train oil, by means of superheated steam. It is sold in the form of jelly containing chemical preservatives.

The Deepest Bore Yet.—It is reported that a depth of over 5200 feet has been reached in boring at Schladerbach, near Halle, by some Prussian mining engineers.

A Pleasant Household Deodorizer is made by pouring spirits of lavender over lumps of bicarbonate of ammonia.

California Quicksilver.

The production of quicksilver in the United States has been made the subject of investigation by the Census Bureau, and a special report is about to be issued.

The statistics have been prepared by J. B. Randol, under the supervision of Dr. David T. Day in charge of Mines and Mining, 11th Census. No similar statement was published as a part of the last census, so that comparisons cannot be well made.

During the calendar year 1889 there were 26,464 flasks, or 2,024,496 pounds of quicksilver produced in California. About 20 flasks, less than $1000 in value, were produced in Oregon.

There are 11 productive mines in California with 36 furnaces. The productive mines and active furnaces employed 937 operatives, of whom 416 were engaged on surface work, and 521 were employed underground. The number of tons of cinnabar ore mined in producing the quicksilver was 95 714. The expenditure was $219 622 for supplies and $526,289 for wages. The average cost per flask of quicksilver produced ranged from $65.70 to $21.66, the average cost for all being $33 31.

The active establishments employed 62 steam motors, with a capacity of 2190-horse power; 54 boilers, of 2438-horse power; one electric dynamo and motor of four-horse power, and one water-wheel of three-horse power, a total of 2197-horse power in motors. Two hundred and forty-seven animals were also reported as employed, but it is probable a greater number were in use.

The total capital invested in the 16 establishments is stated at $1 331,114, of which $680,470 is in mines and real estate, $222,300 in furnaces, houses and other surface improvements; $146,150 in machinery, supplies, tools and live-stock; $124,075 in quicksilver unsold; $34,644 in bills and accounts receivable, and $125,456 in other assets.

The following is the production of quicksilver throughout the world for the last ten years, in flasks: United States, 407,675; Spain, Austria and Italy, 685,936; grand total, 1,093,611.

Comstock Miners.—The force of miners employed in the Comstock mines at the present time is between 1200 and 1300 men. Taking the carpenters and top hands, there are about 1500 men employed in and about the mines of the old lode. Figuring this force at $4 a day, though carpenters receive $5 a day, the monthly pay-roll would foot up $180,000, which is just about what the *Enterprise* figures it at monthly, exclusive of the mills.

Work has been commenced on the Knight's Landing levee extension. Other levee work near Marysville will be done in the next few weeks.

Passing Events.

The official trial of the new cruiser San Francisco this week was in every way satisfactory, and will result in quite a handsome bonus to the local builders, for the increase in speed. The building of these fine vessels in this city shows what can be done by our mechanics and shops when they have the opportunity.

The molders' strike is still on. There has been some talk of arbitration, but the foundrymen say they have nothing to arbitrate. They have plenty of non-union men in the shops, and continue with their work in the ordinary way.

Congress is still tinkering with tariff matters, and this week has been considering lead and lead ores, nickel, mica and other like substances.

The action of the Mining Stock Association, in bringing suits against the directors of certain mining companies to return certain large sums of money lost to the companies through their acts, may in the end lead to a better condition of affairs in mining-stock circles.

THE monthly pay-rolls of the mines and ore-reduction works in Butte City, Montana, and its suburbs aggregate $710,000. The total number of men employed is estimated at 7000.

Comstock Mine Management.

In several articles of late the MINING AND SCIENTIFIC PRESS has called attention to the peculiar methods and manipulations connected with the milling of ores from the Comstock mines, by which the mill-owners and not the mine-owners get the most of the profits from the ores while outside stockholders pay assessments to keep up the system. It seems that at last the matter will be ventilated in the courts. Mr. M. W. Fox, chairman of the Executive Committee of the Mining Stock Association, has addressed a letter to the Directors of the Hale and Norcross M. Co. stating that he is a stockholder and that he believes the stockholders have been deprived of some $2,000,000 in the past three years by the acts of the directors in forming a combination with the owners or lessees of the mills. He then goes on to describe how the value of rich ores had been reduced to a low average; how even then only half the average value was returned by the mills, and how many thousands of tons of ore not worth the cost of extracting were extracted and milled, etc.

Mr. Cox concludes his letter as follows:

I am prepared to furnish sufficient evidence to prove the above charges, and therefore demand that you institute an action in the proper court and in the name of the Hale and Norcross Silver Mining Company to compel a restitution of the property, and for a judgment against each and all of said conspirators for the full amount of said loss.

And I further demand that you at once cease from further co-operating with said mill-owners or lessees in said fraudulent conspiracy and combination, and return to the treasury of the Hale and Norcross Silver Mining Company all the moneys and property you and each of you have received as your portion of the profits of said fraudulent scheme.

It is stated that if the Hale and Norcross directors fail to put the above request in force, then action at law will be instituted. We are informed that this suit will be followed by similar actions against several other Comstock mining companies. These suits will be largely based upon charges heretofore published in these columns.

The Mining Stock Association has employed W. T. Baggett, a prominent lawyer of this city, to file suits against the directors of the company and the mill-owners, asking for the return of the property and to urge the Attorney General of California to institute criminal proceedings against all concerned in the alleged misappropriation. These suits are to be commenced within a few days.

The officers of the Mining Stock Association say they are in a position to prove that large amounts of ore were of a much higher grade than reported to stockholders. They also state that bullion from the mine has been taken into the Carson Mint at night in a secret manner. These are very serious charges which the directors of the Hale and Norcross must meet. Of course if they are not true, then the officers of the Mining Stock Association will be apt to have some libel suits on hand.

Water-Power and Electric Transmission.

It has only been about two years since the attention of mine operators was first called to the practicability of electric transmission of power and the great advantages of substituting by this means water-power for steam where it could be had within any reasonable distance, and where the conditions were such as not to admit of a direct application.

For readers are perhaps not all aware of the interest that has been awakened in this subject, and the rapid progress made in its development. Comparatively few of the mining States have such an endowment in the way of rivers and streams as Colorado, and these, in the majority of cases, afford sufficient head to give, in connection with the Pelton wheel, great possibilities in the way of power, and so far Colorado leads all the country in enterprises of this character.

We gave, some months ago, a description of the Roaring Fork plant at Aspen, which is producing by means of eight small Pelton wheels some 1400 H. P., distributing it to the surrounding country for both power and light. This plant has now been in operation something more than a year, and it continues to work most satisfactorily. Since that time many other installations of a similar character have been made in that State, among which may be mentioned that of the Aspen Mining Co., consisting of four Pelton wheels, running under 50 feet head, with a capacity of 200 H. P., the power from which is transmitted some three miles by Thomson-Houston generators, running pump, hoist, tramway, etc. This plant was started up some three months ago, and is reported in every way satisfactory in result.

One of the most recent installations of this character is that of the Caroline Mining Co. of Onray, Colorado. This plant, now in course of construction, consists of two Pelton wheels of a capacity of 400-horse power to run under 525-feet head, and to operate United Edison dynamos, the power of which is to be transmitted 3½ miles to the mine through two strands of 00 wire ground return. The machinery to be operated consists of a Knowles pump with a 750-feet lift, 30-horse power hoist, 100-ton concentrating mill and a sawmill.

With such evidences of progress in the practical application of this means of transmission, no one need hesitate to adopt it with conditions any way favorable to its success. The Pelton wheel affords so many advantages, not only in the matter of high efficiency, but facility of adaptation to varying speeds and pressure, that it seems to be specially adapted to this class of service, and has therefore been generally adopted for electrical work.

Successful Trial of the Cruiser.

The cruiser San Francisco, the latest war vessel built by the Union Iron Works of this city, has for some weeks been making short preliminary trial-tests, but the official speed-test was not made until Wednesday, in the Santa Barbara channel course. The vessel got under way early in the morning, and steamed in a southeasterly direction about ten miles below the southern end of the course. She then turned and started toward the course, gradually increasing her speed. The course was determined entirely from shore bearings, which had been previously placed in position. About 7:30 o'clock the San Francisco was drawing to the line which marked the commencement of her trial. Her engines were making over 100 revolutions, and everything was in readiness to give her a fair start. At 7:41 she entered the course and started on her four-hour run. The first four miles of the course was run over in a little more than 12 minutes—almost a 20-knot pace. This rate of speed was maintained during the whole run of 40 miles, and after a run of two hours one minute and thirteen seconds the cruiser crossed the northwestern line, a minute and a fraction being the trifling time that prevented her from making the whole distance at a 20 knot rate.

On the trip up the channel the engines had averaged from 126 to 129 revolutions, but as soon as the cruiser turned in a large circle without diminishing her speed and had struck into the course again, 15 minutes later, she was immediately forced a little more, and at one time a maximum of 131 revolutions was reached, and the vessel was driven through the water at very great speed. At this time a slight accident occurred. Water got into one of the chambers, through which a current of air is fanned into the furnaces for the purpose of producing a forced draft. Consequently the water was being forced into the ash-pan and then into the fire, and it was necessary to stop one of the fans for some time until the chamber could be cleared of water. When the fan was stopped the draft was accordingly shut off to a certain extent and the steam ran down, which caused considerable loss of power for some time.

Some minutes were lost by this accident, reducing the average speed. The maximum speed was about 20 knots. The actual time consumed in making the 80 nautical miles, not including the turning time at the farther end of the course, was 4 hours, 5 minutes and 57 seconds, or practically 4 hours and 6 minutes, being only six minutes over the time which would have given her a 20-knot record.

The actual speed averaged during the run of 80 miles was 19.516, being 16-100 of a knot less than the record of the Philadelphia. During the entire run, with the exception of the trifling accident already mentioned, there was not a slip in any part of the machinery, and the fire-room and engine-room were comparatively comfortable.

The trial board has forwarded a dispatch to Washington stating that the average speed of the San Francisco was 19 7-10 knots.

Blue Gravel in Siskiyou County.

We had a call the other day from Mr. C. B. Jillson, formerly of Forest City, Sierra county, and one of the original developers of the famous Bald Mountain gravel mine. He is now working a gravel mine called the Blue Gravel, about one mile and a half from Henley and two miles from Hornbrook station, Siskiyou county. Upon a visit to that section a few years since, he became convinced from his experience in working ancient channels in Sierra county and elsewhere, that similar deposits could be found there, for plenty of gold had been found in the modern rivers. For a nominal sum he bought the ground he is now working. He then set to work to run drifts, obtain water rights, etc. He built seven miles of ditch and some flumes, and has now some 800 inches of water for three or four months, and somewhat less before and after.

The preparatory work on the claim has taken about two years, and this is the first season that gold has been produced. With a light head of water, the last four weeks' run paid 33½ cents per cubic yard of earth moved, and 55 cents for every superficial foot of bedrock stripped. Mr. Jillson showed us a fine retort of $3200 value and about $1000 in coarse gold nuggets, all well water-worn and plain channel gold. The dump is into the Klamath river, and there is no farming going on below to interfere with the mines.

Mr. Jillson says this is the first work on an ancient channel in that section of country. The placers were known at an early day, and the Klamath river, immediately below his mine, was very rich. Above the confluence of this channel, there is not a color in the Klamath for a long distance. It is a new departure entirely. The ancient channel, Mr. Jillson says, is traceable for 20 miles north. It is capped by sandrock. Some bunches of lava are found, and east of the claim there are great quantities. There is a large tract of this mining ground. There are only two locations near by. The Extension Co. on the north are sinking on the west rim and getting good prospects. It is not clean quartz gravel, but a conglomerate. The rim is very plainly defined. They have not gone fully across yet, but suppose the width from rim to rim to be about 1200 feet. The sandstone sets right down on the rim.

The river below this point was rich, but above there was nothing. The early miners took out the placer gold and quit without finding its source. Most of the settlers near by are stockmen. This claim is hydraulicked with a 3½ inch nozzle on a 13 inch pipe. Some of the ground will be drifted. The tunnel will be about 500 feet long for the drifting work.

Copper.

The French syndicate, or Societe de Metaux, which made the attempt to corner the copper of the world and failed so disastrously, sold last month the balance of the copper they had except 2000 tons, which is subject to litigation. The French bankers had made advances on the stocks of the syndicate, and they sold the copper to recover these advances. The reduction of the quantity of copper held on account of this famous syndicate from 179,000 tons to little more than 2000 tons in the course of 16 months—the value in the meantime advanced about $100 per ton—shows not only good management on the part of the vendors, but also to what a low ebb stocks held by consumers in all parts of the world had been reduced. The enormous consumption of copper during this period was also largely due to the greatly extended use of copper wire for electrical purposes, and of sulphate of copper for the prevention of disease in vines. As far as can be learned, the manufacture of sulphate of copper will probably absorb 20,000 tons more copper this year than last.

Last month the arrivals of copper in England were 1462 tons from Chili and 2210 tons of fine copper from the United States. A curious feature of the market was the reshipment of 400 tons of ordinary Anaconda (Montana) copper matte to New York from Liverpool, while in the same month that mine shipped to Liverpool 2950 tons of argentiferous copper matte.

The statistics of James Lewis & Sons' Liverpool report show that while the supplies of cop-

per to England and France for the first half of this year have been 3319 tons less than for the first half of last year, the consumption and export have been 33,444 tons, or more than 50 per cent greater. The stock of copper in both countries on the 30th of June, this year, was 39,896 tons less than on the same date last year, or 69,481 tons against 109,377 tons.

The United States continues to ship more copper into Liverpool and South Wales than any other country, not excepting Chili. The amount shipped for the first seven months of each year for the past six years by the United States was as follows: 1885, 14,553 tons; 1886, 9236 tons; 1887, 6010 tons; 1888, 16,530 tons; 1889, 15,276 tons; 1890, 13,898 tons. In the first seven months of 1889, Chili shipped to Liverpool and Swansea 14,653 tons, and in same period in 1890, 13,691 tons. These figures are instructive as showing the growth of our copper-mining industry, which has received its most recent impetus by the wonderful development of the Anaconda mine, Montana, owned by San Francisco capitalists.

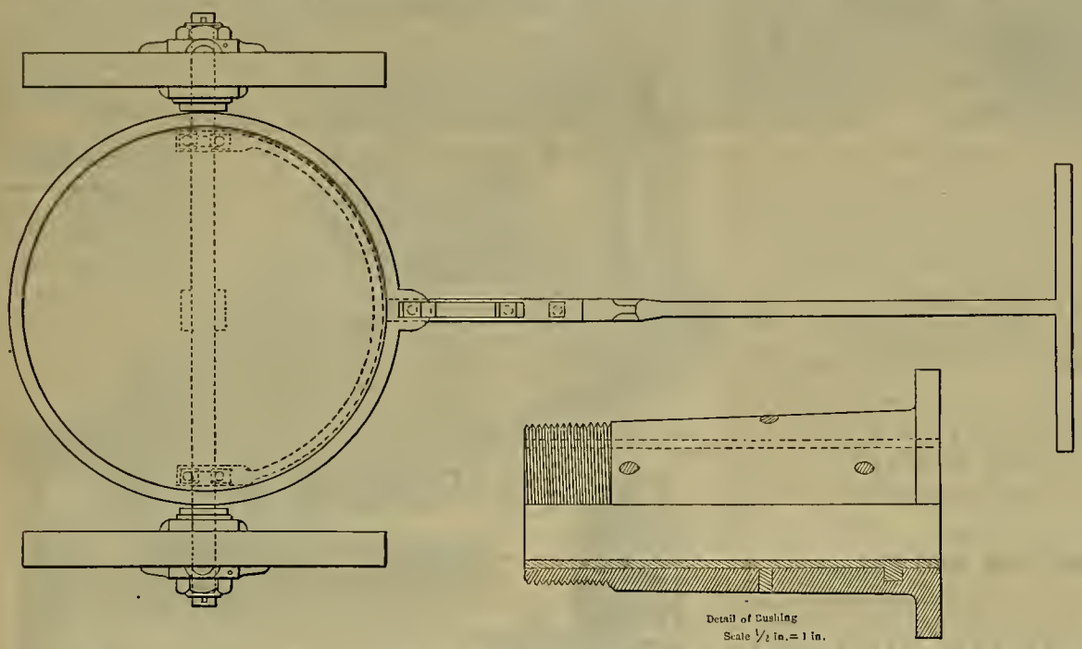

Fig. 1.—MODEL OF SLAG-POT FOR LEAD FURNACES.

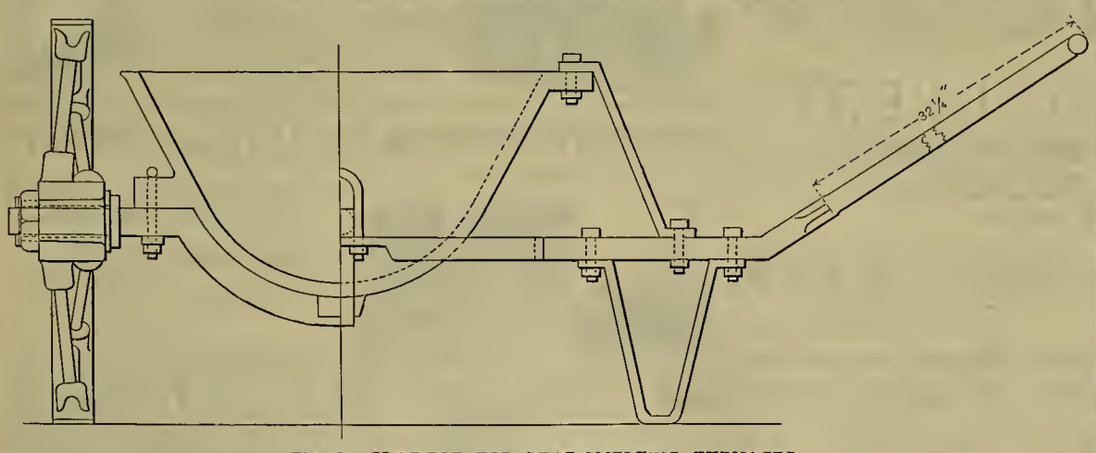

Fig. 2.—SLAG-POT FOR LEAD-SMELTING FURNACES.

Implements Used in Lead Smelting.

Mr. W. S. Keyes, the well-known mining engineer, in a chapter contributed to the last report of the State Mining Bureau, gives the following list of tools and other implements required at and about a blast furnace in lead smelting:

For the Feeder—Two D-handled steel scoop-shovels, size 8, wide mouthed. The shovel proper is 14 inches in width by 16 inches in length. Two square-pointed, long-handled steel shovels, size 3. Two napping hammers, No. 8, weight six pounds; for breaking up coke, slag, etc. One three-quarter inch rod of wrought iron, with ball for loosening up the ore. One 10-pound double-faced striking hammer, No. 52. Two bars one and one-half inch octagonal machinery steel, 10 feet long. Two bars one and one-half inch octagonal machinery steel, 11 feet long. Two bars one and one-half inch octagonal machinery steel, 12 feet long. Sundry gads, 18 inches long, of one and one-quarter inch steel, and a number of stiff brooms.

For the Weigher—One scale, 1000 pounds capacity, with a platform 30 by 42 inches. One one-wheel E barrow, for weighing up charges. One long-handled steel shovel, size No. 4. One scraper, to clean the scale platform. A number of coarse brooms.

For the Coal Passers—One coke buggy, holding about 500 pounds of coke. One large wheelbarrow, for charcoal. Two 14-tine steel coke forks. One No. 8 scoop-shovel.

For the Ore Wheelers—Two ore cars of 12 cubic feet capacity. One D-handle shovel, size 4, and a number of picks and brooms.

For the Furnace Floor—Thirteen slag-pots, 23 inches in diameter, for a 60-ton furnace. See accompanying Figs. 1 and 2, showing a model with details. Two matte or speiss pots, if such be necessary. One one-inch octagonal steel bar, five feet long. Two three-quarter inch octagonal steel bars, 4½ to 5 feet long. One five-eighth inch octagonal steel bar, four feet long, for tapping, when necessary. All these bars must have diamond points and large heads. It is well also to have a number of "claws" made of Norway iron, to assist in withdrawing the bars if any of them should become stuck inside the furnace. One ten-pound double-faced striking hammer, No. 52. One four and one half-pound double-faced hand drilling hammer. Two three-eighth inch rods of iron, six to seven feet long. One three-fourth inch rod of iron, 12 feet long. One three-fourth inch rod of iron, eight feet long. One tuyere poker, three-fourth inch round iron, 4½ feet long. Two scrapers, one-fourth by two inches flat iron, 20 inches long. One tamping-iron, having a face of two inches by one-half an inch, and one inch in thickness, and a handle 18 inches long. Three tamping-rods for plugging up slag-hole, about eight feet long, with buttons on one end about two inches in diameter. Ten bullion molds, each holding 100 pounds of metal. One trimming chisel, five-eighth inch octagonal steel, with a face of 1½ inches. One skimmer for skimming the bullion in the cooler, provided such be used. One small skimmer for cleaning the surface of the metal in the antimonio tap. One bullet ladle for taking slag samples. A number of bullion ladles made of one-fourth or three-sixteenth inch charcoal iron, 8½ inches in diameter and 3½ inches in depth, to which is attached a gas-pipe handle two feet ten inches in length, turned so as to form a proper hand grip. The handle must be securely riveted to the bowl. In blowing out the furnace there will be required two long bars, 1½-inch octagonal steel, 12 feet in length. Sundry shorter bars, drill pointed. Two rabbles, 7½ inch by 6 inch face, securely riveted to eight-foot handles with a proper hand grip. Two goat-foot hooks for withdrawing lumps or accretions. Two perforated ladles, 14 inch by 12 inch face, with eight-foot handles of seven-eighth inch diameter, and proper hand grip, to clean out the metal in the crucible. Lamps and lanterns. For the base bullion sampler there is required: One punch of seven-eighth inch octagonal steel. One cold chisel. One set three-fourth inch figures.

The Bruckner Roasting Cylinder.

We illustrate on page 135 the most approved form of the Bruckner roasting cylinder. These furnaces are made from 6 feet to 8½ feet in diameter and from 12½ to 18½ feet long, and are lined throughout with fire-brick. The shells are of heavy boiler-plate, to which are attached two heavy chilled iron and steel rings, each of these resting upon two chilled iron rollers, upon which the cylinder is supported and revolves. Motion is given to the cylinder by means of spur and bevel gears.

Ore is introduced into the cylinder through two charging doors, which come directly under the gates in the charging hopper placed over the furnace. This hopper is of iron, supported by cast-iron columns, and holds sufficient ore to charge the cylinder. The roasting of the ore is effected in this furnace in lots of several tons, and when thoroughly roasted and chlorodized is discharged into hoppers beneath cylinder, from which it can be drawn into cars as wanted.

Sometimes a different arrangement is made, by which the roasted ore is discharged directly into cars passing under center of furnace. At one end of the cylinder fire is made in an iron fire-box lined with fire-brick, and having an opening in the end to match that in cylinder, and through which the flame passes.

The fire-box, as will be seen in cut, is mounted on wheels running upon a track at right angles to the axis of the cylinder, thus admitting of its being moved to one side when the furnace is not in use, and affording ready access to the interior of the cylinder for repairs or other purposes. As the furnace revolves, the ore is thoroughly mixed and exposed to the flame and heat, and roasting is effected. The time occupied in roasting can be varied at pleasure, so that very base ores can be thoroughly treated. In this respect the Bruckner furnace possesses an advantage over most mechanical furnaces, for in them the time the ore remains in the cylinder and exposed to the flame is necessarily limited.

The Union Iron Works of this city have made a large number of these furnaces, 12 of the No. 3 below having been furnished by these works to the Anaconda reduction works, Montana. They were of the same general style shown in the cut. Others have been furnished to the Compania del Progresso, Mexico, and the Belmont mine, Nevada.

Death of Rev. Dr. McKaig.

Rev. Walter Wilber McKaig, well known throughout this State as preacher, orator and writer, died last Sunday in Oakland, aged 63. He had been for years afflicted with diabetes, and his death was the close of a tedious, often painful illness, the last three months of which he was kindly cared for at the Fabiola hospital.

Dr. McKaig was a native of Ohio, the son of a Scotch farmer. He studied for the ministry and began preaching as a Methodist, but afterward joined the Presbyterians. He had charge of churches in Cincinnati and Chicago, and when David Swing was accused of heresy, Dr. McKaig warmly espoused his cause, and was afterward tried himself, on similar charges, but acquitted.

Coming to California about 1868, Dr. McKaig first ministered to a large and thriving Presbyterian Society at Marysville, but having become a convert to liberal views, he moved to San Jose, where he preached for some time to the Unitarian Society.

Afterward, having studied law, he was admitted to the bar and practiced awhile in Colusa, having ex-Attorney-General Hart for his partner. But he was heard to say that although he could earn more as a lawyer than as a preacher, he always regretted having left the ministry. And in truth he never gave up preaching altogether, but often filled the pupils of the late Rev. L. Hamilton in Oakland and of Dr. Stebbins in San Francisco, besides delivering addresses to various Spiritualist associations.

In later years he edited the Stockton *Independent*, and was engaged successively in editorial work on the Oakland *Tribune*, *Enquirer* and *Evening Express*. He also tried law and journalism in Los Angeles. His latest work was done for the *Illustrated Pacific States* and the *Rural Press*, and the many articles which he wrote for our columns, from 1883 to within a few months of his decease, were marked by a philosophic insight, a humane spirit, a wise breadth of treatment and a combined strength of thought and felicity of diction which made them at once pleasing and impressive. His editorials for holidays and anniversaries, and on questions of wide bearing and large public import, were especially happy and suggestive.

Dr. McKaig was a member of the Knights Templar and Enterprise Lodge, A. O. U. W., at San Jose. He leaves two sons and a married daughter, the latter residing in Chicago.

The funeral services took place at Hamilton hall, in Oakland, Tuesday morning. Rev. C. W. Wendte of the Unitarian church and Rabbi M. S. Levy spoke eloquently of the departed, and James G. Clark sang feelingly certain stanzas written by himself.—*Pacific Rural Press.*

THE STANFORD UNIVERSITY.—It was announced some time ago that work on the Stanford University buildings at Palo Alto had been suspended. The report, however, seems to be unfounded, as the work is now being pushed forward as rapidly as possible. The six school-buildings are completed save for the interior decorations. It is believed that the University will be finished in time to begin the scholastic term in September, 1891.

—THE—

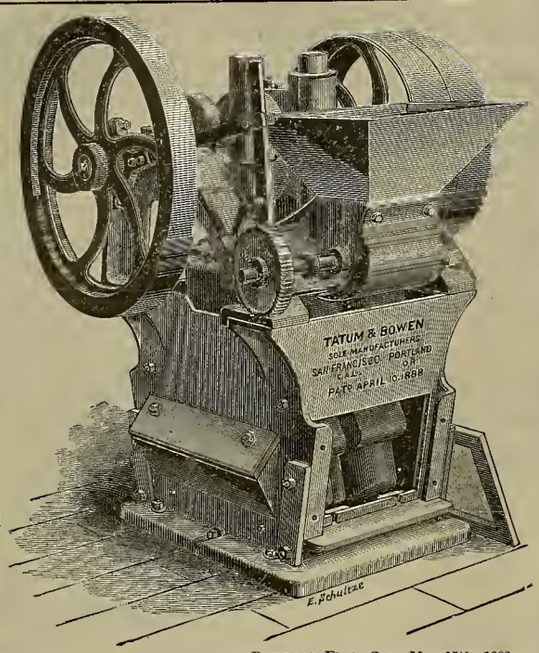
PERFECTED

DOUBLE

Economic

Quartz

Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

The Mills ae we make them now are Far Superior to the one at the New York Mine.

TATUM & BOWEN,

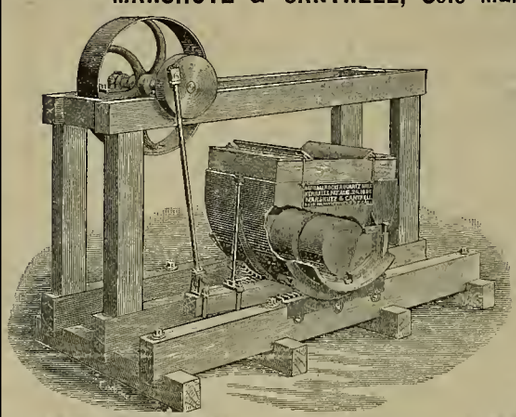
NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL.

ADAMANTINE SHOES & DIES

FOR STAMP MILLS.

These SHOES and DIES are in extensive use in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.

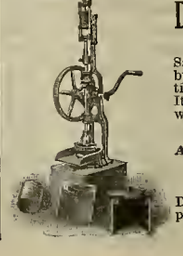
—MANUFACTURED BY—

CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent,

220 Fremont Street, San Francisco, Cal.

Special attention given to the purchase of Mine and Mill Supplies.



Day's Improved Quartz Stamp Mill.

This Mill is designed for the Prospector, the Assayer and Sampler of Gold and Silver-bearing rock. It is a perfect mill, built entirely of metals, and of the best mechanical construction; will amalgamate perfectly in the battery or on plates. It strikes a sharp, heavy blow with a light stamp. Shipping weight, 225 lbs. Price $75. Address

JAMES DAY,

ATLAS IRON WORKS, Cor. Napa and Lonisiana Streets, Potrero, SAN FRANCISCO, CAL.

N. B.—CHAPPARELL, Butte Co., Cal., Nov. 10, 1889.—Mr. Jas. Day, Chico: The little mill is a daisy; it comes up to all expectations; it works perfect in all respects. Yours truly,
WALKER, REESE & Co.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Oodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL....

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,

SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

SUSPENDED TRAMWAYS.

General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

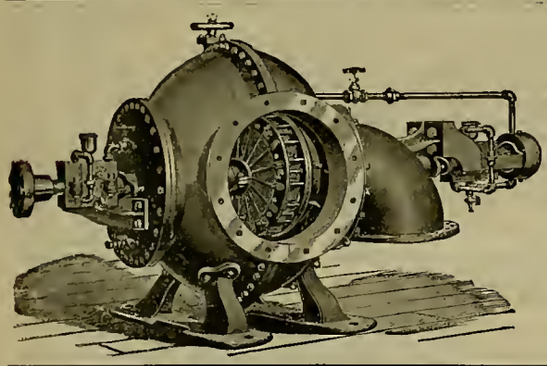
HELENA, MONTANA, Room 28, Merchants' National Bank Building, No. North Main St.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted to capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

Educational.

The Evans School OF ASSAYING AND CHEMISTRY,

Rooms 46 & 47, 2d Floor Montgomery Bl'k. } 628 Montgomery St. San Francisco,

Also, Evening Classes, 7 to 10 o'clock.

Surveying, Architecture, Drawing and Assaying

723 MARKET STREET,

The History Building, SAN FRANCISCO, CAL.

A. VAN DER NAILLEN, President.

Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full course of assaying, $50. Send for circular.

HEALD'S BUSINESS COLLEGE,

24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

SEND FOR CIRCULAR.

E. P. HEALD, President.

C. S. HALEY, Secretary.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 220 Market St., San Francisco. Elevator, 12 Front St.

Rock Drilling and Air Compressing Machinery

For TUNNELS, QUARRIES, MINES, RAILROADS

HOT AND COLD BATHS FREE.

Terms, Board and Room, $1.00 per Day

And Upward.

Rooms with or without Board.

Free Coach to the House.

J. POOLEY.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 28, 1890.

General trade continues fairly active. The high price of farm products continues to inspire confidence in the future. Immigration is beginning to set this way, causing small farms to be in better demand.

The money market is easy, notwithstanding an enlarged demand for funds for moving the crop.

MEXICAN DOLLARS—The market is strong at full figures. The demand is not so active. Quotations are given at 92@92½ cts.

SILVER—The feeling is hullish. Considerable is being held for sale in next month. Offers are made direct to the Department at Washington, and consequently counter-rates are misleading, being fully one cent below Mint prices for large parcels. Washington advices report the following purchases: Aug. 22: 100,000 ounces at 119.3, 100,000 ounces at 119.4, and 150,000 at 119.5. The total offerings were 1,520,009 ounces. Aug. 25: The amount of silver offered was 100,000,000 ounces. The amount purchased was 200,000 ounces at $1.195, 100,000 ounces, $1.1974, and 150,000 ounces at $1.1975. Aug. 27: The amount offered was 1,911,000 ounces, and the amount purchased was as follows: 138,000 ounces at $1.19, 115,000 ounces at $1.19⅝, and 325,000 ounces at $1.19¼ per ounce. London cables received to-day report an advance of ⅜d. Eastern mail advices report that the Secretary of Treasury will buy all the silver offering at reasonable figures irrespective of the monthly quota. It is an open secret that the Secretary will do all he can to force silver to par. The country needs the money and his course meets with commendation.

QUICKSILVER—The market is irregular at quotations, owing to free imports by rail. Receipts the past week aggregate as follows: 208 flasks, and by overland railroad 300 flasks; total, 508 flasks. Exports the past week aggregate 446 flasks to Mexico and 10 flasks to New Zealand.

LIME—Receipts the past week aggregate 4724 bhls., and exports by sea 200 bhls. to Honolulu. The market is steady.

BORAX—Receipts the past week aggregate 7271 centals. The market is fairly steady.

LEAD—The market is strong at full prices. We make several advances in quotations.

TIN—The market is stiff for both plate and pig in sympathy with better prices abroad. English cables report an active demand for plate at improved prices. The Amman furnaces at Swansea have been restarted. The advance in silver is in favor of holders.

COPPER—The market is very strong at full quotations. The Lake companies appear disposed to keep prices at about 17 cts. London cable to the *Iron Age* reports as follows: Copper is much stronger. The rise is attributed chiefly to covering of short sales on which deliveries are due next month, and purchases of three months' futures by the combination which now holds the bulk of the stock here, and appears determined to maintain prices. The public are not buying at present prices and consumers are waiting. Stocks have decreased heavily during the past fortnight, owing to small arrivals from America.

IRON—The market is strong, with a good consumption reported. The East reports a more active market. From England, cablegrams report a strong market at a slight advance.

COAL—Imports the past week aggregate as follows: Seattle, 4220 tons; Coos Bay, 450; Departure Bay, 849; total, 5519 tons. The market is very strong, with the tendency upward for all kinds. A reported fire in the Wellington mine and a general strike by laborers in Australia are important factors in producing a higher market. The feeling is decidedly hullish, which will result in much higher prices unless the strike is declared off, or else non-union men are secured to go to work at an early day. At this writing, fuller information is awaited with impatience. The coast coals will increase their output, but even this with a scarcity or a shut-off from Australia will not meet our requirements in the near future.

Mining Share Market.

On Friday and Saturday last the Comstocks were active and at higher prices, but on Monday and part of Tuesday the market was slow at shaded prices. Tuesday afternoon prices began to advance under Ophir's leadership, which was followed by higher prices for all stocks on yesterday (Wednesday) morning. In the afternoon, prices were barely steady at lower quotations. There is every indication that insiders are still buying, being forced to do so owing to many outsiders selling so as to buy back for less money—the points being out for lower prices and also that there will not be anything in the market except little ups and downs before the middle of next month (September). In order to help the hears, reliable news from the mines is kept back, delay made in starting the pumps and everything else done to encourage selling.

In outside stocks Bodie has been active on a report of a strike on the 700-foot level. Our advices do not report a strike, but they state that the ground is very fertile and that there is every encouragement for finding a rich pocket for which the mine is noted. In the Quijotoas, Central has been more active, a block of 1000 shares changing hands at an advance, with more bid for at the same price. The Tuscaroras are showing more life at advancing prices. The advance in silver is used as a hull argument in their favor. Eureka is also more active at higher prices.

The high and advancing prices of silver is an incentive for more active prospecting in the Comstock mines. It is not at all unlikely hut more men will be put to work in several of the mines at an early day.

The Kentuck Mining Co. receives a weekly letter from the superintendent of the mine, giving full detailed iuformation of the work being done, and also the daily ore assays. Evidently the company, hy the suit against Gov. Stevenson, has learned that it is rather expensive not to obey the law. More lawsuits will have to he brought to teach other companies that they are not above the law.

The *Report* of this city is authority for the statement that Commodore Flood says that Col. Mackay and he control the Con. California and Virginia mine. If this be correct, why do not the two gentlemen have the mine run according to law—give the mine assays, etc., and have everything else done to disarm criticism? There are many aside from Col. Mackay and Commodore Flood who own stock.

The Andes Mining Co. has four miners, an increase of two since last March, at work, which probahly accounts for the advance in the stock. Assessments must be collected and the several officers paid good salaries for the arduous work they have to perform.

Private advices from the Comstock mines are hard to get, owing to insiders trying to stop all leaks. Our correspondent writes that there is a good deal of secret work going on in several of the mines which is of an important character. Official letters received yesterday report active prospecting in Hale and Norcross, but this is offset hy the battery assays going down to $13 a ton. In Savage, further improvements are reported. Crown Point's and Belcher's battery assays are higher, the former about $3 a ton more. In Belcher, Seg. Belcher, Challenge, Confidence and Overman, active and promising prospecting work is under way. The superintendent of the Kentuck Mining Co. reports officially as follows: "I am trying to discover something new on the 1000-foot level. The indications for success are very good. If I am fortunate enough to succeed, it will create a big rumpus, for it would be 100 feet west of the west ledge. The ground improves as we go west, as can be seen hy the assays sent to you." At the office in this city these assays show a steady increase from a few cents a ton to over $2 a ton, with nearly all gold. From Con. Virginia confirmatory information is received of the improvement noted hy us fully three weeks ago. In Ophir, connection between the 1300 and 1465 levels will he made within a few days, when active and important prospecting will be inaugurated. A north drift has been started from the Potosi winze to tap an ore hody in Chollar. From Sierra Nevada, Union, Best and Belcher, the news is of an encouraging character.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Assessment Notices.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of August, 1890, an assessment, No. 19, of six (6) cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of September, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of October, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office, Room 11, No. 303 California Street, San Francisco, California.

DELINQUENT NOTICE.

GOVER MINING COMPANY—LOCATION of principal place of business, City and County of San Francisco, California; location of works, near Drytown, Amador county, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 14th day of July, 1890, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Wheeler, W A	53	1,100	275 00
Pratt, Freeman	95	50	12 50
Small, John C	96	1 066	266 50
Trefethen, George	99	500	125 00
Sanborn, Helen P	101	250	62 50
Dyer, S C	102	200	50 00
Parsons, C A	103	200	50 00
Stone, N I	142	3,000	750 00
" "	155	2,000	500 00

And in accordance with law, and an order of the Board of Directors, made on the 14th day of July, 1890, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California, on SATURDAY, the 6th day of September, 1890, at the hour of one o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

GRAY DEW, Secretary.

Office, 13 and 15 Fremont street, San Francisco, California.

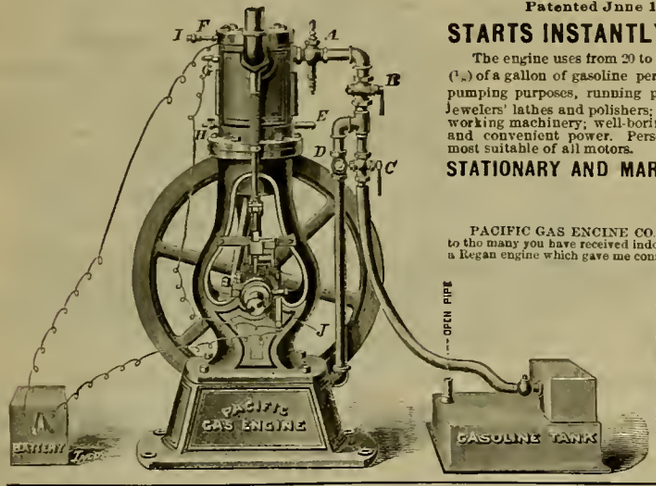
THE PACIFIC GAS OR GASOLINE ENGINE.

Patented June 17, 1890—Nos. 430,504, 430,505, 430,506. Also in Great Britain and other foreign countries.



STARTS INSTANTLY WITHOUT THE NECESSITY OF BOILER, FIRE OR EXPERIENCED ENGINEER.

The engine uses from 20 to 25 cubic feet of coal gas, or about one eighth (⅛) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, Jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED, and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY AND MARINE ENGINES FROM 3-4 TO 15-HORSE POWER. OVER 100 IN ACTUAL OPERATION.

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890.

PACIFIC GAS ENGINE CO.—GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, mine was a Regan engine which gave me considerable trouble. I had to remove the head and raise the tappet valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliances, head, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head from any cause since you made the change (over two months). It gives me no trouble; my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective and cheap.

Respectfully yours,
B. S. HILL.
Cor. Eocinal Ave. and Morton St.

U. S. MARINE HOSPITAL SERVICE, DISTRICT OF THE PACIFIC,
SURGEON'S OFFICE, PORT OF SAN FRANCISCO, Feb. 1st, 1890.

TO THE PACIFIC GAS ENGINE CO.—GENTLEMEN: In answer to your letter of inquiry, of the 23d ultimo, relative to the working of the two-horse power vapor gas engine, recently set up by you at the U. S. Marine Hospital, Mountain Lake, near the City of San Francisco, Cal., I have to say that, up to date, the engine has given entire satisfaction, developing the power required in the specifications; of "raising 20,000 to 30,000 gallons of water 100 feet high through 600 feet of two-inch iron pipe, to tanks on the hill, in 24 hours." It is more economical than steam, requires less attention, and can be set in operation at a moment's notice.

If it continues to do its work as satisfactory as it has done since December 22d, 1889, when placed in operation, it may be pronounced a perfect success.

Very respectfully, PRESTON H. BAILHACHE,
Surgeon U. S. Marine Hospital Service, Custodian.

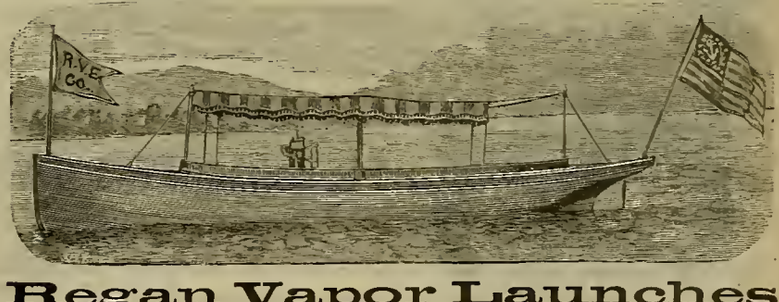
Send for Our Large Illustrated Catalogue.

GEORGE HAAS, 824 Market St., Phelan Building, }
SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It does my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.

Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room;** the boat will seat twice as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway,** and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

TRANSPORTATION OF ORE BY HALLIDIE'S PATENT WIRE ROPEWAY.

HALLIDIE'S
PATENT WIRE ROPEWAY,

For the Economical and Rapid Transportation of Ore and other material.

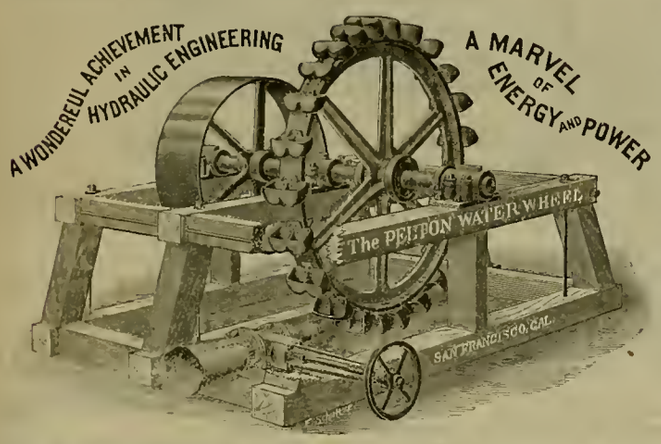
Erected by Us During the Past Fourteen Years in Spans of
200 TO 2,000 FEET.

Simple, Economical and Durable.

HAVE BEEN THOROUGHLY TESTED
In all Parts of the Country.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.



A WONDERFUL ACHIEVEMENT IN HYDRAULIC ENGINEERING
A MARVEL OF ENERGY AND POWER
The PELTON WATER WHEEL
SAN FRANCISCO, CAL.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.
121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

RUPTURE AND PILES.

We POSITIVELY CURE all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of KNIFE, DRAWING BLOOD, or DETENTION FROM BUSINESS. Terms: **No Cure, no Pay; and no Pay until Cured.** If afflicted, come and see us or send stamp for pamphlet. Address:

DRS. PORTERFIELD & LOSEY,
838 Market Street, - - San Francisco.

TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

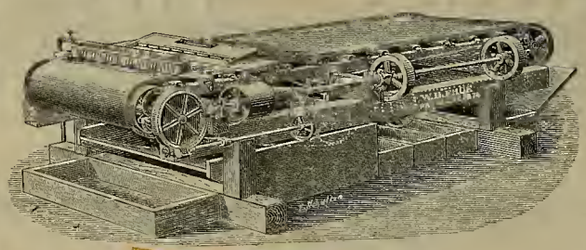
THE RUSSELL PROCESS.

For information concerning this process for the reduction of Ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING [illegible] Room 15, No. 132 Market Street, San Francisco, Cal.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

FOR SALE CHEAP

BY

RISDON IRON & LOCOMOTIVE WORKS,

THE FOLLOWING CHOICE LOT OF

PUMPING, HOISTING AND QUARTZ MILL MACHINERY,

COMPRISING THE ENTIRE PLANT OF

THE JOSEPHINE MINE,

AND INCLUDING

2 HAMILTON CORLISS ENGINES, 10″x30″, first-class condition.
2 TUBULAR BOILERS, 52″x16 feet, complete.
1 TUBULAR BOILER, 40″x14 feet, complete.
1 LOCOMOTIVE BOILER, 5 ft. furnace, shell 28″ dia., 9 feet long.

1 9x10 DOUBLE CYLINDER VERTICAL HOIST with Indicator, Cable, Cage and Cars.

FULL SET PUMPING GEARS, Bob and Connections, Pumps, Column Pipe, &c. Lot of Steel Rails.

1 20-STAMP GOLD MILL.
8 FRUE CONCENTRATORS.
4 CHALLENGE FEEDERS.
1 BLAKE ROCK BREAKER.
ORE BIN GATES, RETORTS, MELTING FURNACES, ASSAYING OUTFIT.

5 STEAM PUMPS, 4000 FEET WATER PIPE.

ALL BUILDINGS, including Residence, Office, large lot Mining Tools, Complete Blacksmith Outfit.

Will sell all or a part cheap. Everything nearly as good as new.

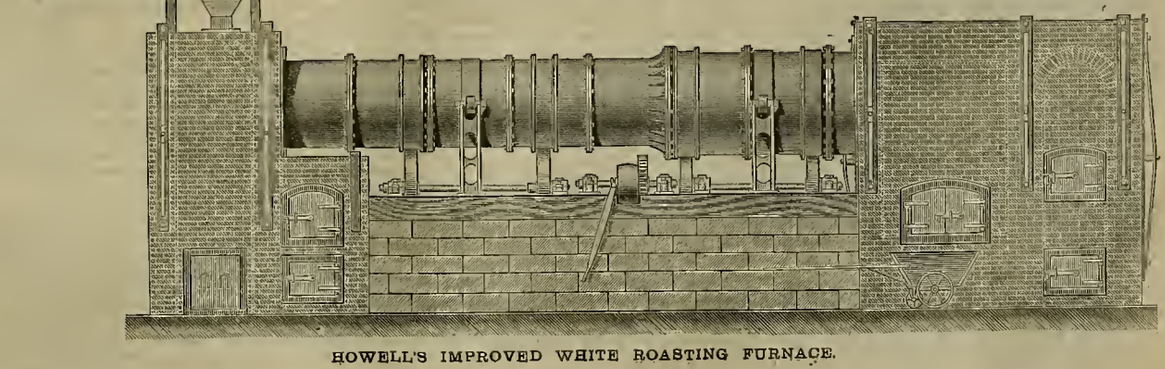
FULTON IMPROVED WHITE ROASTING FURNACE, WITH AUTOMATIC DISCHARGE AND MIXER.

Ore-Roasting Furnaces.

On this page is shown the well-known White roasting furnace with improvements made by the Fulton Iron Works of this city, which greatly facilitate the handling and adjusting of the cylinder, and also for discharging the roasted ore from the bin. The ore upon coming from the batteries is elevated into the hopper, shown above the furnace, and is from there taken by a conveyor and fed into the upper end of the cylinder. The amount of salt needed for proper chlorination is added before the pulp enters the cylinder. This furnace is entirely mechanical and continuous in its action, and consists of a long cast-iron cylinder, made in sections to facilitate handling and transportation, and is lined at the mill with firebrick throughout its entire length. Several courses of these brick project beyond the others, so that in passing through the pulp is raised by the turning of the cylinder and showered through the flame. As will be seen, the roasting cylinder has a slight inclination, and is supported by and revolves upon four sets of rollers. The distance at which these rollers are set apart determines the inclination of cylinder, and consequently the inclination can be varied at pleasure, as will be seen in Fig. 2. As the frames carrying the rollers are supported in trunnion bearings, they at once adjust themselves to the angle of the cylinder. This change in the inclination of the cylinder of course directly affects the length of time the pulp is retained in it, and the pulp can in this way be roasted for a longer or shorter period, as may be necessary.

Motion is given to the cylinder by means of gears and pulleys. The fire-box is placed at the lower end of the cylinder, the flame passing directly into it; and as the pulp passes through from the upper end, it is subjected to a gradual increase in the intensity of the heat until it is discharged into the bin under the fire-box. At the bottom of the bin the pulp passes through an opening on to a cast-iron table, over which heavy iron scrapers slowly move, discharging the ore into a mixer or tank, into which stirrers thoroughly mix it with water, which is here introduced, and is then led to pans in a pipe or sluice. The speed with which the scrapers move across the face of the table can be adjusted to suit the discharge from furnace. The dust carried out of upper end of cylinder is collected in dust-chambers having their sides inclined to the foot of an elevator, by which it is carried up to hopper above furnace, and again goes through with the ore. It will thus be seen that this furnace is entirely continuous and automatic in its action; and where the Boss pan process is used, all handling of the ore, so common in dry-crushing mills, is avoided.

The other engraving shows Howell's improved White roasting furnace, made by the same works. It consists of a cast-iron revolving cylinder, differing principally from the White furnace just described in having only that portion of the cylinder nearest the fire lined with fire-brick, the balance being exposed, as the heat is not so great at the upper end. The cylinder is of the same internal diameter throughout, the difference in the external diameter being due to the fire end being lined with brick. Projecting shelves are arranged on the sides for showering the pulp through the flame, as in the White furnace. The cylinder, as shown in the accompanying engraving, is supported upon four rollers or wheels, and is revolved by the friction between it and the wheels, the latter being driven by means of gears and pulleys. It is kept in its central position on the top of the wheels by means of guide rollers acting against its sides. The angle of cylinder as illustrated cannot be changed; but, when desired, these furnaces are furnished with adjustable rollers, etc., as with the improved White furnace. An auxiliary fire is sometimes used at upper end of cylinder for roasting the dust which is carried through, and the iron work for which is furnished when called for; but this is now seldom used. This furnace is made in this city by the Fulton Iron Works; as is also the Bruckner ore-roasting cylinder, illustrated last week, and erroneously referred to as made by another local foundry.



HOWELL'S IMPROVED WHITE ROASTING FURNACE.

The Silver Situation.

There is considerable dissatisfaction felt regarding the course of the Secretary of the Treasury in allowing the Mint-counter rate to be a fixed price and from three-quarters of a cent to over one cent an ounce below the prices paid by the Department at Washington under direct selling offers. This discrimination, it is claimed, is not only in direct contravention to the spirit of the law now in force, but it helps speculators to the injury of small producers. This latter assertion is evidenced by the fact that local buyers in this city pay for small lots from a quarter to one-half of a cent an ounce above the Mint-counter rate, and sell to the Department in round lots at an advance paid by them, thus netting a good profit. The purchases of the Department since August 13th aggregate a little over 4,250,000 ounces, or within 250,000 ounces of the quantity required by law for the monthly purchases. The buying of this quantity has sent the price up in this country, and also in Europe, to higher figures than have obtained for fully eight years. If this buying has done so much, free coinage would soon bring it to par.

So far, the theories of monometallists against the white metal are exploded, and with such favorable results as our Eastern exchanges show have so far resulted from the advance in the price of silver, himetallism has made many proselytes, and it is quite safe to affirm that the next Congress will pass a free-coinage bill.

CINNABAR ORE has been discovered on Quicksilver mountain, the southern continuation of War Eagle mountain, Idaho.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Colorado Desert.

[Written for the PRESS by C. R. ORCUTT, San Diego.]

The broad alluvial plains lying west of the Colorado river, in San Diego county, California, are generally known under the name of the Colorado Desert. These plains and the contiguous barren hills and mesas have as yet been scarcely explored by man, and only small portions of this region have yet been in any way carefully examined.

Nearly one-half of this arid section of the West lies within the Mexican Territory of Lower California. Altogether it probably exceeds 12,000,000 acres in extent. In all probability no portion of the arid lands of the United States is as little known, but in reality of as great value, as is this great basin, the larger portion of whose surface is below the present sea level, and whose surface is strangely strewn with millions of both fresh-water and marine-fossil shells.

That portion of the desert in San Diego county is rich in mineral wealth, and not destined to always remain agriculturally a desert, even in name.

The Gila desert, in Arizona, is an eastern extension of this arid tract; while on the north the Mohave desert is only separated from it by a low range of sterile mountains.

The Colorado Desert division of San Diego county lies between the San Jacinto range of mountains on the west and the Colorado river on the east, bounded on the south by the Gulf of California and on the north by the eastern extension of the San Bernardino range, which separates it from the Mohave Desert section of San Bernardino county. The peak of San Jacinto, at the northern line of the county, is the highest land in California south of Mount San Bernardino, and rises precipitously from the plains of the desert to the hight of 9000 feet. Its snow-crowned, pine-clad summit appears in strong contrast to the naked, heated plains at its eastern base.

Between San Bernardino and San Jacinto Peaks

There lies the low San Gorgonio pass through which the Southern Pacific railway wends its unimpeded way; and at the summit of this pass is located the thriving town of Beaumont. A few miles farther east is another lively town—Banning, which, with apparently an abundant supply of water, has changed a portion of the desert slope into smiling vineyards and orchards, interspersed with fields of grain. From Beaumont to Indio, for a distance of nearly 50 miles, there is a gradual descent from the fertile lands of San Bernardino valley to the ash-like bed of the famous "Dry lake." This constitutes the Cahuilla valley, bounded on either hand by an austere mountain range some ten miles in average width and 50 miles in length. The wash or drainage from this valley falls into the Dry lake mentioned, and several perennial mountain streams lose themselves very effectually before traversing its howlder-strewn plain. The Whitewater river at times forms a broad, turbulent stream, flowing from the San Bernardino range; while Snow creek and numerous other lesser streams run more or less spasmodically from the treeless northeastern slopes of Peak San Jacinto.

The Southern Pacific R. R., after traversing the full length of this, maintains about the same general direction—southeasterly—across the great cheerless plains of the Colorado desert proper to Yuma, a total distance of nearly 160 miles. The old military post of Fort Yuma was situated on a commanding bluff on the west bank of the Colorado river and therefore in California. The town of Yuma is on the opposite bank in Arizona. Fort Yuma was in the extreme southeastern corner of the State, and enjoyed a truly tropical climate, thanks to the great desert that surrounded it.

The Mineral Belt.

The mountain spurs along the western back of the Colorado river are rich in the precious metals, and mining operations have been carried on there for many years. Besides extensive mines of gold and silver, lead, copper, iron and other valuable metals are known to exist, some of them in immense deposits, but as yet scarcely "prospected."

This rich mineral belt practically extends westward through the entire range of low desert mountains that divide the Mohave and Colorado deserts, but owing mainly to the diffidence of capital to enter a region bearing the name of desert, but little work of development has as yet been accomplished.

On most maps issued in late years there is given an apparently extensive river terminating in the Dry lake. This sometimes appears without a name, but usually it is designated as New river since it has only been known for a few years, and is supposed to have had its origin in overflows of the Colorado river which have occurred in recent years. Twenty years ago

The Colorado River

Was in the habit of annually overflowing its banks during the time of summer freshets when the snows in the mountains around its headwaters melted. This overflow has not occurred since 1884 until the present year, I believe. There has thus been formed a channel through a deep and rich alluvial bottom, which received the name of New river from the earlier pioneers who crossed this desert.

Along the course of this New river the Indians planted and raised most magnificent crops on the lands which were overflowed, as they still do on the lands near the gulf where they have been compelled to retreat. Corn, melons, squashes and other vegetables and grain reached the rankest growth attainable, and those early pioneers yet speak with wonder of the success which these Indians met with in their agricultural labors.

Not only were the cultivated crops large but the natural vegetation along the New River section was equally rank. The grasses and weeds formed an almost impenetrable mass of vegetation—sunflowers became "small-sized trees," a grain of mustard-seed truly gave shelter to the birds of the air and the country very generally belied its name.

This overflow gradually receded into Dry lake, situated in the northern part of the great basin into which New river naturally drained, and there the water disappeared into the deep, porous soil and sand or quickly evaporated before the heat of a tropical sun.

The surface of Dry lake is of a fine sedimentary character, combined with an immense quantity of vegetable matter, consumed by dry rot and forming what may be called a "dry bog." The lake forms the lowest portion of the great basin, is 250 to 300 feet lower than sea level, and owing to the character of its surface, as above described, cannot be traversed.

Fossil Shells.

At Salton, a station a few miles farther east on the railway, the fresh-water shells are found in countless numbers on the surface of the plain, which evidently once formed the bottom of a lake. These fossils are all in a semi-fossil or semi-silicified condition, and are often drifted into windrows, where they may be scraped up by the quart. *Aurnicola longinqua physas, planorbis ammon* and *anodonta Californiensis*—the latter the common fresh-water clam of the Pacific Coast—are the principal fresh water shells detected among this shell debris, but the surface is strewn with these far to the southward to below the United States boundary line, along the course of New river. Probably the whole of the vast area outlined is below the present sea level, and portions are over 300 feet below—Salton being 250 feet lower than the Gulf of California.

The Old Beach-Line of this Ancient Lake

Or sea is well defined along the railway at the base of the mountains, and can easily be traced, always at the same level, for miles and miles along the eastern base of the San Jacinto and Chuckawalla mountain chains. The rocks are worn and rounded up to this line, sharp and ragged above. This line is even with the present sea level, which would seem to suggest that instead of having been a fresh-water lake, this was formerly an arm of the sea, and indicates that the Gulf of California once extended fully 200 miles farther to the northward than it does to-day. Further evidence tends to confirm this view.

Along the west shore of this ancient sea, as we shall call it (what is now known as the Colorado desert)—at present a vast alluvial plain so surrounded by mountains as to form a huge inland basin—there exist enormous deposits of fossils belonging (in my judgment) to the Miocene age. These are largely composed of oyster and allied shells, and extend from below the present sea level to an altitude of probably a thousand feet above. Some of these deposits are hundreds of feet in thickness, forming large mounds and low hills.

It is evident that the sea occupied this basin during the Pliocene epoch up to a late date, for fossils unquestionably belonging to this period are found on the desert, such as the marine *Ocinebra poulsonii* and the *Solecurtus Californianus*—both of which are found living to-day at San Diego. Dozens of the odd valves of the latter are found strewn on the surface of the ground at Salton, in an excellent state of preservation, and in the same semi-silicified condition as the fresh-water shells with which they were associated.

The remarkable point in this connection is the fact that these marine shells and the fresh-water snail-shells *were found associated together, in the same condition, and apparently belonging to the same geological age!*

The *Physa*, the *Planorbis*, the *Anodonta*, and probably the *Aurnicolas* also, are all to be found living to-day in the waters of the Colorado river—the same species whose external skeletons are so numerous and so freely strewn over the great basin.

The Desert and the Gulf.

It can be very readily understood that the sea must have occupied this basin within, geologically, very recent times. The cause of the separation of this ancient arm from the gulf is very apparent, and the same agency in the sediment from the Colorado river is constantly increasing the barrier between them. Doubtless this separation took place within the history of man, for the Indians still preserve the memory of catching fish along the base of the San Jacinto mountains in an ancient sea, and will point out to the stranger the traps or artificial walled-up pools where they caught the fish when the tides receded.

As I have already shown, it is evident that only a few years have elapsed since this whole expanse was a portion of the Gulf of California—a branch separated by a narrow strait since closed by the sediment and debris of the Colorado river. This is the only way by which I can at present account for the presence of the recent marine shells strewn along the edge of the Dry lake. The Colorado river, flowing into the isolated, shallow sea thus formed, soon changed it into brackish and ultimately to comparatively fresh water. The salt of the sea was precipitated by the evaporation that went on into valuable salt mines (that are now being worked), as the evaporation exceeded the inflow. Meantime the marine fauna had perished, except a few which were able to stand the brackish water—such as Solecurtus Californiensis being the last to succumb. The main branch of the Colorado hurried past to the gulf, and only the overflow, surcharged with the fine reddish sediment, reached the basin.

But this was sufficient to form a great depth of the finest and richest of alluvial soil along its route through New river to the Dry lake. Evaporation was rapid. Few years were probably sufficient after this basin was shut off from the sea and the main branch of the Colorado river flowed into the gulf before it virtually became what it is to-day, a barren, desert plain, which occasional overflows are able to convert into a garden of tropical luxuriance.

The Colorado's overflowing its banks doubtless resulted in such a condition of affairs as Dr. R. E. C. Stearns suggests—a system of shallow lagoons just adapted to the multiplying of the pond and river snails from the Colorado. These lagoons must have been of sufficient duration to allow of the maturing of the fresh-water mussel, and still they may have been dry a good portion of the year, as is now the case.

An Inhospitable Region.

Leaving the discussion of the geological problems that confront us to some more convenient time, we will return to the present. It is truly something fearful to contemplate these scorching plains as they exist to-day, with the sun beating down upon the drifting sands with an intensity of heat that often raises the temperature to 130° or even 140° F.

Woe to the adventuresome spirit that ventures unadvisedly at such a time as this upon the stony trails leading into this inhospitable region. Many a man has left his bones to bleach in the clean, white drifts of sand, and the skull of one of these unfortunates rests within my museum as I write. And how many others have left their earthly tenements to decay in poisonous springs of alkaloid or other mineral water, after quaffing their last welcome but fatal drink! Only the coyote and the scorching winds can tell.

Still, many more stand ready to take their chances in the insatiable greed for gold—gold, which if found, might only prove more deceitful than the false mirage—only tempting them on to both temporal and everlasting ruin.

Oh! what beautiful visions arise to the weary eyes. What entrancing landscapes lie spread out before the traveler. Lovely streams of water seem dancing over sands of gold, and placid lakes surrounded with trees and palatial residences invite the unwary to their destruction. What hopeless agony must the poor deluded victims suffer, when, with staring eyes and lolling tongue, they realize too late, and sink to their last rest upon the burning sands. Perhaps, however, they are spared the pain of realization. Let us hope so at least. The hundreds of beautiful variations assumed by this natural phenomenon have often been described, and to one in safety are ever a source of pleasurable wonder and speculation.

Wild Flowers.

There is another side, however, to the picture we have drawn—one more pleasing to contemplate, though it may seem to the uninitiated scarcely less visionary than the optical illusions just mentioned. In early springtime—if there has been sufficient rain, as is *sometimes* the case—these plains are transformed into a vast garden of the choicest flowers in innumerable variety. Every color of the rainbow is imprinted on the smiling faces about you, and the traveler may roam at pleasure among the imperial beauties of a fairy queen's throne-room.

The stately day lily nods its head familiarly to the multitude of humbler flowers that have sworn it allegiance. The foot treads over carpets of vari-colored Gilias. The butterfly tulip startles the eye with its brilliancy, blue-eyed Phacelias, beds of the Golden Eschscholtzia, and numberless other flowers in every form and coloring challenge attention.

The wild fruits and native productions of a country furnish to the thoughtful observer a slight index to its capacity for the production of other fruits and flowers. If capable of growing in a favorable season such wealth of floral beauty, is not this so-called desert capable of better things? If flowers that are destined to "bloom and waste their sweetness on the desert air, and blush unseen," find congenial surroundings here, may we not believe that man may transplant others for his use and delectation?

Palm Trees.

The traveler on the Southern Pacific railway may observe something dark and indefinable against the barren and distant hills near Indio. On investigation this will prove to be a forest of thousands of wild palm trees, the fine Washingtonia filifera, which has become so characteristic of Southern California gardens. Here they grow naturally in the greatest luxuriance, some attaining an estimated hight of over 100 feet. Thousands of others exist in the deep and rugged canyons, where they assume proportions as yet unequaled anywhere by this favorite Californian fan palm where it is in cultivation.

The presence of these trees here in their thriving condition naturally suggests the adaptability of the country for the date palm, which, I believe, is destined to prove an important factor in the future development of this region. The wild palm has provided past generations of Indians with the means of existence in its small, sweet, black fruit; the date may support many future generations of our own race. Its success can scarcely be doubted in the face of experience with the date in Southern California and Arizona.

Irrigating Arid Lands.

No greater problem is before the American people to-day than how they shall treat our arid lands. All portions of the arid regions of the West are capable of the highest degree of cultivation. The key of the situation is irrigation. No part of the vast area termed arid in the West will prove more susceptible to kind treatment than the now feverish, parched, dreary waste—exceeding 5,000,000 acres in extent—designated on modern maps as the Colorado Desert.

California, formerly famous for her wealth of gold, and now equally and justly famed for her excellent fruits, has no more important possession than this neglected southeastern corner, which some day will greatly enhance the fame of our beautiful State.

Future generations may see it become one of the most densely populated and wealthiest sections in the State. Here the date, the banana, the mango, and all the luscious fruits of Asia, Australia and tropical America will flourish as nowhere else within the present limits of the United States.

To review, even briefly, the natural resources, the mineral wealth, the questions of geological moment, of climate and the great horticultural possibilities of this region, would consume a good-sized volume, but I hope the rural population of California may gain a better idea of this portion of the nation's arid lands, and not be entirely ignorant of its existence within our boundaries.

Nevada County Mines.

Grass Valley and Nevada City Districts.

[Written for the PRESS by PROF. GRANVILLE F. FOSTER.]

The wealth of Nevada county, Cal., has hitherto consisted of her vast deposits of gold, and will doubtless so continue for many years to come. The area of the gold-bearing quartz near Grass Valley is small, but it most certainly makes up in quality what it lacks in quantity, for it has unquestionably one of the richest ledges in the world. It is found only in a strip of land, seven miles long by four wide, and is joined on the north to the Nevada City mining district, where the ledges are also very rich. Mining in this locality, when carried on systematically and with proper judgment, has always paid large profits on the amount of capital invested. To this there has been no exception. Gold mining, like any other enterprise, must be carried on with proper economy and with careful attention to details if success is to be attained. The days have long since passed away in which fortunes could be picked up off the ground or obtained by a little labor of individuals with pick, pan and rocker. It now requires capital and enterprise—money and brains—to make gold mining profitable to those engaged in it. But given these, and so far as the Grass Valley mining region is concerned, success has followed in the past and must follow in the future.

The Famous Idaho Mine.

The principal mine is, of course, the far-famed Idaho. The ledge upon which this mine is located was formerly known as the Eureka, and was opened first in 1865. It is situated about two miles east of town on the east bank of Wolf creek. At first the stockholders used steam-power for mining and milling purposes, and during the last year that this was true the enormous quantity of 8500 cords of wood were consumed. About this time two enterprising Englishmen, Edward and John Coleman, brothers, who had before been the principal stockholders, became also the managers of the mine and the running expenses were reduced materially. First water-power was substituted for steam power, and finally the most approved machinery was introduced, until it can be said without question that this is the best-managed mine in the whole world. At present there are between two and three hundred men employed in the mine. The yield to the end of the fiscal year 1888, according to official reports, was $9,207,227.25 worth of gold. It has probably now reached nearly $11,000 000. The running expenses per week average $5100.

The Maryland Mine

Is situated northeast of and adjoining the Idaho, and upon the same ledge—a ledge of surpassing richness. The capital stock of the company is divided into 500,000 shares, of which S. P. Dorsey, Esq., of Grass Valley, owns three-fourths and controls four-fifths. Among other stockholders are the Coleman Brothers of the Idaho mine, and W. W. Young of San Francisco. *A priori*, this mine would be considered exceedingly rich without directly testing, since

it is situated on the same ledge as that of the Idaho, but an unexpected proof of its unusual richness has lately appeared. For some time past the workmen of the Idaho have been operating just on the border of the Maryland, and the fact comes to light that the nearer the workings reach the boundary line of the two mines the richer the quartz becomes. Mr. Dorsey has been offered large sums for his interest in the mine—sums in some cases approaching half a million dollars, but he has invariably refused all, for though willing to sell shares enough to yield sufficient money to develop more fully the mine, he is unwilling to lose his control. It is the conviction of many eminent mining men that the Maryland will yet eclipse the famous Idaho, and since the latter is reaching the period when it will be worked out, the former must soon be fully opened up and its subterranean wealth brought to light. Upon the Maryland a shaft has already been sunk to 400 feet and hoisting works are in place.

The Empire Mine

Is one of the oldest in the vicinity. It is still worked to better advantage than ever before. The value of its ore averages $12 per ton, costing some $7 to mine and reduce, leaving a profit to enumerate all the mines in the vicinity of Grass Valley, since new ones are being constantly opened. At the present time there is certainly no indication that the wealth underground is being exhausted to any appreciable extent.

Nevada City District.

The other mining district in the vicinity of Nevada City presents some valuable mines which are now yielding well, but the district is not so rich, so far as its gold-bearing quartz is concerned, as that of Grass Valley. Nevada City formerly depended upon its hydraulic mining for its wealth, but since the strong finger of Uncle Sam has been placed on this wealth-yielding enterprise the city has been declining in population. It is a shame that the millions on millions of wealth lying in the sands of the hills around Nevada City must remain unearthed that the navigation of an insignificant stream might be conserved for the benefit of the few. If these millions of dollars' worth of gold now condemned to lie unearthed could be put into the market, all enterprises, even that of farming in the valley, would feel the invigorating impulse. It is to be feared that the farmers who have succeeded in causing hydraulic mining in the Sierras to cease, are like the man who killed the goose that laid the golden egg. The money that would be derived from hydraulic mining in one month would be worth more than the whole commerce of the little Sacramento in a year.

Since the ceasing of hydraulic mining many persons in the county have commenced fruit-raising, and no region in the State is better adapted to the raising of the apple, pear and peach than this.

Grass Valley, Cal., August, 1890.

HONEST MINERS.—A dozen years ago a company was organized to develop a mine at Unionville. There were several practical miners, whose capital consisted of willing hands, says the *Silver State*, and a lawyer and a hotel-keeper in the company. Thousands of dollars were expended in labor on the mine, and, as the price of silver continued to depreciate, the ore would not pay to ship and the company had not means to erect reduction works on the ground. Operations were suspended and an account stated acknowledging an indebtedness of $9000 to the hotel-keeper was signed by all the members of the company except the lawyer. That was 10 years ago and no effort was since made to collect the account. Recently the company sold the mine and the first instalment of the purchase-money, amounting to over $12,000, was paid here two days ago. The miners and the lawyer, too, none of whom are overburdened with worldly wealth, promptly paid the $9000 though it had been outlawed for years, and like honest men congratulated each other on being able to cancel a just debt. Such men are truly the noblest work of God.

The Gold Belt of Northern California.

Ancient River Channels and Gravel Deposits.

NUMBER XII—SUPPLEMENTARY.

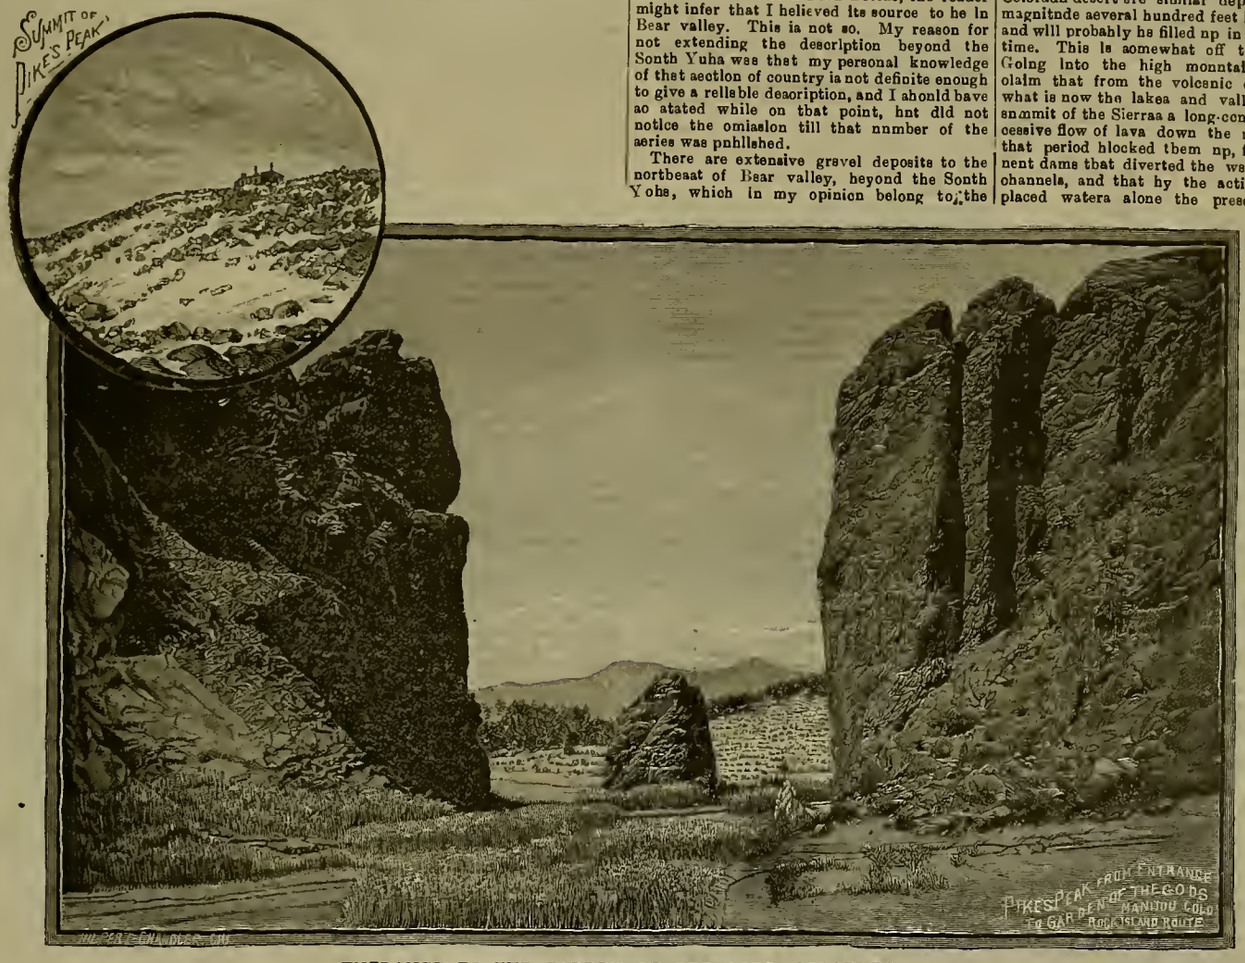
[Written for the MINING AND SCIENTIFIC PRESS by JAMES F. TALBOTT, Blue Canyon, Placer Co.]

[The concluding number of Mr. Talbott's articles was printed in the MINING AND SCIENTIFIC PRESS of August 23d, page 120. This week we publish a supplementary article, which, while not originally belonging to the series, sums up briefly the points on which the "river theory" is based.—EDS. PRESS.]

In concluding this paper, which has been extended to a greater length than was intended in the outset, I deem an apology and some explanation due the reader. For any repetition or apparent want of connection on the different points, my excuse is that the most of it was written up of evenings after the day's work in the mine, and that I have done my very best. In explanation of my description of the ancient channel of the North Fork Divide, the reader might infer that I believed its source to be in Bear valley. This is not so. My reason for not extending the description beyond the South Yuba was that my personal knowledge of that section of country is not definite enough to give a reliable description, and I should have so stated while on that point, but did not notice the omission till that number of the series was published.

There are extensive gravel deposits to the northeast of Bear valley, beyond the South Yoba, which in my opinion belong to the ere what is now termed the "ancient channels," and it is possible that the fine gold now being mined in the sands of the ocean beach was carried there by some of these rivers before the uplift of the Coast Range of mountains. It is possible, too, that the great revolution that obliterated this system of rivers was ushered in by the vast uplift of the Coast Range in a continuous unbroken line, and a subsidence of the land to an unknown depth and extent between the Coast Range and the foothills of the Sierras, with a simultaneous volcanic outburst along the Sierra Nevada mountains.

This immense depression (known to be more than 1500 feet in depth from the sinking of the gas well at Stockton, which was in fine washed gravel when they stopped boring) formed a vast dump, which has taken all the material displaced between the lava ridges and an unknown quantity of volcanic debris to fill up. This missing material can be accounted for in no other way. The accumulated waters evidently covered this deposit to a considerable depth till the gap through the Coast Range at the Golden Gate was cut out and gave an outlet for the water, leaving a vast extent of fertile land above sea level. Death valley and the Colorado desert are similar depressions of less magnitude several hundred feet below sea level, and will probably be filled up in the course of time. This is somewhat off the main line. Going into the high mountain region, we claim that from the volcanic outburst from what is now the lakes and valleys along the summit of the Sierras a long-continued and excessive flow of lava down the main rivers of that period blocked them up, forming permanent dams that diverted the water into other channels, and that by the action of the displaced waters alone the present system of



ENTRANCE TO THE GARDEN OF THE GODS, COLORADO.

rivers, canyons, ravines and deep gravel deposits were formed.

The Garden of the Gods.

The illustration on this page shows the entrance to the famous Garden of the Gods, located near Manitou Springs, Colorado. In the foreground, as shown in our view, are seen the massive walls of red sandstone rising on either side of the opening to the height of 100 or 150 feet. The wall was originally continuous, but has been worn through by erosion. In the background, through the opening, may be seen the snow-capped summits of Pike's Peak, rising to a height of 14,000 feet above the sea level. Of this locality, Prof Hayden writes in his report as follows:

This interesting and peculiar place is a valley in the foothills of the range, and is inclosed by an almost vertical wall of massive sandstone of Cretaceous age. The rocks which we find inside have been subjected to an immense deal of erosion, and the many ridges and tower-like forms left standing throughout the garden are the remnants of the parallel strata which dip to the northeast at a very great angle. In some places they seem to dip a few degrees in the opposite direction. As we go toward the mountains, the dip decreases. These rocks are fine-grained sandstones of a deep brick-red color, with here and there layers and spots of a lighter red, and sometimes white. The ridges are exposed for some distance to the north, while to the south, after bending toward the East, they appear to be covered by the debris from the mountains. The entrance to the "garden" is through the "Beautiful Gate."

of $5 on the same amount. To make such a profit under the circumstances requires the most approved modern appliances and the most rigid economy in the administration, and here in all these things the company has acted according to the dictates of the highest wisdom. Area of mine, 5000 feet by 750 feet; number of stamps in operation, 40.

The North Star

Is an old mine. Early worked out, so far as crude appliances and uneconomical plans then in vogue were concerned, it lay idle from 1872 to 1882. In the latter year a French company took it, pumped out the water, soon sank the shaft deeper until it has a vertical depth of more than 1500 feet, bought the finest appliances in existence to hoist and reduce the ore. They commenced work with a determination to preserve an unvarying economy in everything done, and hence it is now one of the best paying mines in the State. The mine is southwest of Grass Valley, and is situated in a most picturesque spot where the glories of the mountain and beauties of the great valley are both in full view.

Other Mines.

Around the North Star are clustered the Inkerman, the Fahey, the White Oak, the Bowery, the Vulcan, the Irish-American, the Home, and other mines. Around the Allison Ranch mine, four miles below Grass Valley, on Wolf creek (a mine that has yielded $5 000,000), are to be found the Malone, the New Idria, the Golden Chain Syndicate, the Ajax, the Franklin, and other mines. Besides these, there are the Phœnix, the Megenta, the Sebastopol, the Osborne Hill and the Orleans. It is impossible

North Fork system, and of which I may have something to say in the future. In closing this article, I earnestly protest against "substituting" Prof. Hanks' new theory of the deep-gravel deposits for one that I have been a firm advocate of for 30 years. Although "defective," I still adhere to it. I am willing Prof. Hanks or any one else may get up and advocate any theory that suits them, but I object to substituting any new theory until its practical advantages and benefits are demonstrated. Not wishing to enter into a controversy with so eminent a scientific gentleman, I will leave the subject in the hands of some of my co-believers in the river theory (without detracting in the least from the professor's ability), many of whom are his equal in the profession and have more leisure and ability than I. It is evident from the professor's paper on his new theory that scientific men "day-dream and theorize" as well as "miners and prospectors."

Without noticing any objections to the new theory, I will sum up the main points upon which the river theory is based. The "intelligent miner" can read the paper on the new theory and decide which theory be "wholly rejects or retains with doubt." Admitting some repetition, the river theory as I understand and advocate it, assumes that at some period of time of which the most learned geologist has no more positive knowledge than an observant miner, a system of rivers somewhat similar to the present ones, drained the country from the summit of the Sierras to the sea, and contained what we term the original deposit of gold, the gold originating or being formed in quartz ledges by some process that the miner seldom bothers his head with. The beds of these rivers

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, Aug. 30: This company has taken steps toward the erection of chlorination works. The site has been selected on the hill above the office, and grading has already commenced. G. F. Deakin has secured the contract for the erection of the works, and he expects to have them in running order in six weeks. The outside building is to be a frame structure, and the ovens are to have a capacity of 2½ tons per day. This new enterprise is another demonstration of the faith of the owners in the permanent character of this mine, and the people of this vicinity will be pleased to hear of this additional evidence of prosperity. The mine continues to look encouragingly. The sinking operations in the north shaft are considerably retarded on account of the large volume of water encountered. The mill is kept running to its full capacity on rock from the south shaft.

PLYMOUTH CON. GOLD M. CO.—The following financial statement is made public by the management, to Aug. 1st:

Surplus, Jan. 1, 1890	$28,141 42
Gold bullion produced March	2 969 90
From Utica Mining Co., for use of mill	542 52
Wood sold	1, 04 00
Gold bullion produced April	5 055 63
" " May	6 041 37
" " June	7,572 05
" " July	5,649 93
Copper plates melted up	1,770 95
Total	$58,746 77
January expenses	$3.975 05
February "	3.762 57
March "	4.298 19
April "	5.075 63
May "	6 443 17
June "	5 961 37
July " estimated	6,000 00
	$35,510 98
Surplus	$23 235 79

During July the mill was run mostly on the low-grade rock of No. 3. Only about 15 per cent of quantity crushed came from the better rock of No. 2. The sulphurets are yet to be added to the amount given, increasing it to something over $8000. There is very little change to note in the mine. The superintendent reports that the ore body on No. 2 has widened a little and looks well.

MISCELLANEOUS.—The mill of the Amador gold mine is kept running to about half its capacity. A large quantity of sulpburets has accumulated—from 50 to 60 tons. It is reported that they will be kept for treatment on the ground, which means the erection of chlorination works.

FROM SUTTER CREEK.—Cor. Amador *Ledger*, Aug. 30: Grading for the addition to the Wildman mill was commenced on Monday, and in a few days everything will be in readiness for the woodwork. There is a large force of men on grading for the new 15-inch steel pipe to run the hoisting works, which is a distance of about three-quarters of a mile. Some of the digging is blasting ground which will naturally retard their progress to some extent, hut Mr. Tregloan has got some experienced miners on the job and is pushing it with all possible speed. The carpenters are at work putting up a large ore-bin at the hoisting works. Sinking at the Rose mine has been resumed. The air pipes are all in, which improves the air so that the miners can work with perfect safety. The ledge as they go down improves, and indications are encouraging. Preparations are being made for permanent work at the Sutter creek mine. The mill is pretty well torn up and will he rehuilt. The new mortars being made at Knight's foundry are about finished. Mr. Stewart is running the Lincoln mill steadily. The ore being crushed is of a paying character, and appears to improve as developments progress.

Calaveras.

LAVA BED GRAVEL MINE.—*Prospect*, Aug. 30: Lampson & Evans are sinking a third shaft on their mine near Railroad Flat. These gentlemen have been working their mine for about two years. Last fall they washed up about 300 tons of gravel at an average of $12.50 per ton. Mr. Lampson informs us that the channel is from 40 to 100 feet wide, and as far as prospected the average depth is 6 feet. There is a 15-horse power steam hoist, pumps, etc., on the mine and everything is in good running order. The outlook at present is favorable to a small hoom in gravel mining in that portion of the county.

Inyo.

DARWIN.—*Index*, Aug. 27: Parties who recently visited the old reliable camp say that a marked improvement in mining affairs there is certain to come soon. The water supply which has been short for a long time will be ample and assured with the new pipe now about all laid. The Defiance mine is said to look better than ever before; more ore in sight and of higher grade. As soon as the water works are completed the men will he transferred to the mine. Jim McDonald is in charge as superintendent, and Geo. H. Hardy, hook-keeper. Other mines will start up with the advent of cooler weather.

CERRO GORDO doesn't boom much, out the Danphy & O'Keefe mine is producing 30 tons of rich ore per week with the utmost regularity, only a small force being employed. Developments in the Union are progressing quietly. A largely increased ore output from both mines will follow the running of daily trains.

SAN CARLOS.—Inyo *Independent*, Aug. 29: The tunnel that has been so long in progress at the San Carlos mine was expected to strike the ledge several weeks ago. It has been found that some distance above the tunnel the ledge is bent to the northwest, and this is why it was not reached sooner. The face of the tunnel at last report showed that the ledge was very near, and ore might he struck at any time.

SYLVANIA.—George Thorpe from Sylvania reports that the engine for the hoisting works is nearly ready for work. The furnace will not he ready for use much sooner than October 1st. The principal mine shaft is being timbered into two divisions. A large boarding-house and another building for a store will be completed as soon as possihle. About 75 men, all told, are employed at the camp.

Nevada.

SNOW POINT PROSPERING. — *Transcript*, Aug. 28: The gravel mining interests at Snow Point, on the Middle Yuha river above Moore's Flat, are prospering. John T. Cline and son are taking some good dirt and think they are in the channel they have so long heen looking for. Hegarty & Blackwell last fall had 20 tons of gravel on the dump when the snow came on shutting off the water, and they left it there. When the men went back to resume work they found among other good things that the "natural wash" had exposed on the dump an $80 nugget. The McKillican claim continues to yield satisfactory returns. Snow Point promises to become an important drift-mining center. The work done there so far in this line has been mostly of a prospective character, but the developments are sufficiently advanced to warrant a strong helief that the channel is fully as extensive and valuable as was predicted of it.

Sierra.

DRIFTING. — *Mountain Messenger*, Aug. 30: Work has been recommenced on the Excelsior drift mine in Cedar Grove ravine, stopped owing to the tunnel heing in so far that the fire draft would not furnish any more air. We expect something will be done in the near future to remedy this defect.

MOUNTAIN.—The iron work for the Mountain quartz-mill has nearly all been taken from the Downieville foundry. The men who are putting the mill together say they never put one up where all the various parts went togetber with less trouble than this one.

GOLD LAKE DISTRICT.—*Tribune*, Aug. 30: The Glidden quartz mine, situated half-way between Gold Lake and Gold Valley, is closed down at present. It has a 10-stamp mill and has been worked quite extensively. Some very rich ore has been taken out and it is said that if the mine had been properly managed there would have been no occasion for its closing up shop. The Lone Star mine, of which Joseph Snyder of Grass Valley is superintendent, is in operation. A contract to run the tunnel 600 feet bas been let to Mr. Snyder. Six men are employed. Several tons of ore were run through the Garibaldi mill and it paid over $12 a ton. The 5-stamp mill at the Garibaldi mill is running steadily. At tbe Empire mine in Gold Valley the tunnel is heing pushed ahead. The company propose to erect a mill there next season.

AT THE YOUNG AMERICA MINE.—Mr. G. W. Hughes has been elected superintendent of the Young America mine to succeed P. Deidesheimer. Mr. Hughes is no novice at the business of mining. For many years he was a resident of this banner mining county and for a long period was actively engaged in that branch of industry. In the palmy days of the Keystone when that mine was under the control of H. Scammon, the Downieville banker, Mr. Hughes, was its superintendent. In addition to a long practical experience in the management of mines, Mr. H. possesses a large fund of good, hard business sense, combined with strict integrity. The Young America Mining Co.'s interests will undoubtedly be in good hands with Wasb Hughes at tbe helm.

Trinity.

NEW RIVER MINES.—Cor. Siskiyou *Telegram*, Aug. 26: Mr. Albert Yocum arrived from the New River mines Saturday. From him we obtained the following information in regard to the prospects of the camp: The Mountain Boomer Co. is sinking down deeper on its mine in the hard formation; it has a good-sized ledge of rock which will go $80 per ton. Charley Williams, who bas a lease on the Sherwood mine, is taking out a large amount of ore, the richest yet taken of the mine, estimated at over $100 per ton. The Uncle Sam Co. has its ore dumps all full of ore which goes about $15 to the ton. The mine is showing up better than ever; the ore is not so rich as other mines in the camp, but it shows more ore and is the best defined ledge in the camp. Tbe Ridgeway Co. bas taken on a new lease of life and is now running an upraise from the tunnel to tap the shaft. This company has spent a large amount of money during the last year running a 750-foot bedrock tunnel which taps the mine much deeper than the old works, but unfortunately for them they have not as yet found any ore that will pay. It has also erected a fine 10-stamp mill on the property. The Tough Nut and Irwin mines are also taking out good rock and expect to bave good cleanups.

NEVADA.

Washoe District.

ALTA.—*Enterprise*, Aug. 30: The average battery samples this week were $23.80 per ton, and about 300 tons were crushed. Drifting northwest from the shaft on the 1000 level and cutting stringers of ore. Drifting a west branch from the northwest drift on the 725 level, and cut about a foot-wide stringer of very fair ore.

YELLOW JACKET.—Shipping daily 85 tons of $21 rock.

UTAH.—The main north drift on the 725 level has been extended 54 feet; total length, 406 feet. The formation continues vein porphyry, clay and some quartz.

OVERMAN.—Extracted and hoisted from the 1200 level 361 tons ore. Car samples average $16.27 per ton. Shipped to the Brunswick mill 396 tons of ore. Battery average, $19.19 per ton. Of this, $11 per ton is gold. Incline upraise to the northeast from eleventh floor of the stope is up 37 feet. Material, porphyry, with seams of clay and quartz. On the 20th instant shipped three bars of bullion valued at $11,514.81.

SEG. BELCHER AND MIDES.—The joint 1300 winze has been sunk 17 feet during the week, making its deptb 97 feet. The bottom is in a mixture of porphyry and low-grade quartz.

CROWN POINT.—Shipped to the Mexican mill during the week 644 tons 1930 pounds of ore, the average battery assay of which was $17.13 per ton.

BELCHER.—The 200 level north drift from the west crosscut is advanced 231 feet. The face is in favorable-looking ground composed of quartz, porphyry and clay. The 300 level west crosscut from the shaft is out 535 feet and bas reached what is believed to be the footwall. It has passed through a ledge of low-grade quartz during the past week about 25 feet wide. Lateral drifts in the quartz will he started at once. Shipped to the Vivian mill during the week 306 tons of ore, the average assay of which was $22.82 per ton.

JUSTICE.—We have done no work on the 622 north drift during the past week. Shipped to the mill during the week 192 tons of ore, the average battery assay of which was $26.54 per ton.

CHALLENGE AND CONFIDENCE.—The joint Confidence-Challenge and Imperial west crosscut No. 2 on the 1000 level is out 384 feet; 24 feet made during the week. Face shows quartz of no value. Joint Confidence-Challenge-Imperial north lateral drift on the same level is in 545 feet and has been connected with the Imperial new shaft.

SAVAGE.—On the 300 level No. 1 west crosscut is advanced 33 feet, making its total distance 155 feet. No. 2 west crosscut from tbe face of the north drift is advanced 37 feet, making its total distance 65 feet; face in low-grade ore. During the week we have hoisted from the several levels 654 cars of ore. Shipped to the Rock Point mill 499 tons and milled 456 tons; average battery assay, $19.20 per ton. Have hullion on hand and at tbe mill, $20,400. The battery assay of the past week was low, but it does not represent the good ore on the 1300 level, which has not yet heen shipped to the mill.

HALE & NORCROSS.—On the 900 level we have commenced stoping ore. This level shows considerable ore, but most of it is low grade. We will also stope ore from the 1200 and 1300 levels. On the 1250 level the west crosscut started opposite the south upraise from the 1300 level has reached the west wall and bas been stopped. This crosscut sbows a large body of low-grade quartz. Milled 620 tons of $23 ore as per average battery sample assays.

IMPERIAL.—West crosscut No. 3 from the 500 level north lateral drift is being repaired. West crosscut No. 3 from the 750 level north lateral drift is out 418 feet, having been advanced 25 feet; face shows porphyry. West crosscut No. 1, 1000 level, is out 310 feet; 17 feet made during the week; face sbows quartz having no value.

ANDES.—On the 420 level a north drift from No. 1 crosscut is extended to 41 feet; formation, porphyry and quartz giving low assays. South from No. 2 crosscut extended to 21 feet; formation as above.

OCCIDENTAL.—Extracting fair-grade ore from the stopes on the 400 and 450 levels. The winze from tbe west crosscut on the north line, 550 level, is down 117 feet, the bottom being in quartz and porphyry. East crosscut on the north line, 550 level, is out 276 feet. The face is still in clay and porphyry.

CHOLLAR.—East crosscut No. 2, 80 feet soutb of north line, 800 level, bas been advanced 80 feet; total length 144 feet; face in hard porphyry. During the past week 490 tons of ore bave been milled, average battery assay of which was $20.65 a ton.

POTOSI.—North drift, 1030 level, is out 51 feet; face in a mixture of quartz, clay and porphyry. The winze is down helow the 930 level 374 feet on the slope. The bottom is in porphyry and quartz.

EXCHEQUER.—East crosscut, 150 feet south of the north line, 500 level, is out 98 feet; face in clay and porphyry. The north lateral drift, 620 level, is out 435 feet; face in hard rock.

ALPHA.—Soutbwest crosscut, 600 level, is out 186 feet; face in bard porphyry. Northeast crosscut, 600 level, is out 44 feet; face in soft porphyry and small seams of qnartz.

NEW YORK CON.—North lateral drift, 800 level, from No. 1 west crosscut, is out 373 feet; face in clay and porphyry. The north drift, 650 level, is out 47 feet; face in porphyry. North drift, 1100 level, is out 135 feet; face in quartz and porphyry.

SILVER HILL. — The northeast drift from the winze, 160 level, advanced 20 feet; total, 330 feet; formation, porphyry. The southeast drift on the 260 level advanced 10 feet through porphyry and quartz; total length, 335 feet. Northeast drift, 334 level, advanced 20 feet through hard porphyry; total length, 370 feet.

WARD COMBINATION SHAFT.—East drift from the 1800 station is now out a distance of 518 feet; face in hard porphyry.

BEST & BELCHER.—Upraise No. 1 has been carried up a distance of 10 feet, total bigbt, 29 feet; formation, hard porphyry.

GOULD & CURRY.—On the 300 level, west crosscut No. 1 has been cleaned out and repaired 100 feet. South drift from west crosscut No. 1 has been cleaned out and repaired 115 feet. On the 625 level, the south drift has been repaired 30 feet; total distance, 235 feet.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Aug. 30: During the week tbe Eureka & Palisade R. R. Co. shipped 235 tons of ore to the Salt Lake smelting works.

SALE OF MINING PROPERTY.—Last Saturday G. C. Brown sold his third interest in the Rob Roy mine and mill belonging thereto. He also disposed of his interest in some ten other claims in this district. The purchasers were Capt. Carpenter and Mr. Eggleston of Kansas, who have been operating here for several months.

CLOSED DOWN.—The Eureka Con. works were closed down for repairs last Monday. It will require some two weeks to make the necessary repairs and improvements.

Highland District.

MINING AND PROSPECTING.—Pioche *Record*, Aug. 28: Mining matters in Highland district are picking up, and besides the Mendha and Hamburg mines whicb are worked by the Yuha M. Co., an unusual amount of prospecting is going on.

THE HAMBURG is on tbe same ledge as the Mendha and is also the property of the Yuha M. Co. It promises to become a good paying mine before the winter sets in. At present work is going on in an incline in which a small streak of ore shows well, and all indications point to the opening of a good body ere long. The Hamburg is situated about 600 feet east of the Mendha, and is also under the cbarge of D. Baker.

THE MENDHA MINE, which was purchased some months ago by the Yuha M. Co., is at present working a force of 12 men. The work so far has been on the second level, and in the face of the drift, whicb is about 200 feet from the shaft, a fine body of lead ore, a foot in width, shows up which will average about 80 ounces of silver and 60 per cent lead per ton. Preparations are now being made to commence work at the bottom of the shaft, which is about 80 feet below the second level, and to run a drift parallel with tbe ore on tbe second level. The old guides and ladders have all rotted away and will have to be replaced. At present a whim is in use, but a steam hoisting plant is to be put up immediately. The engine is now in the machine shop at the Raymond Works here undergoing repairs, and will be shipped out and put up as soon as finished. Ore is being daily hauled to the furnace, by teams, the distance being about eight miles. The mine is under the foremanship of Dan Baker.

THE MINERVA.—Preparations are being made to develop this property by Mr. O. C. Perry of San Francisco, who purchased the property some two months ago while down here. We understand that he has purchased a carload of supplies and will be here the latter part of this month to begin active work. Water is now hauled to the mines from town hy the ore-haulers, which under the circumstances is more convenient than bringing it from the brewery.

Tuscarora District.

YOUNG AMERICA SOUTH.—*Times Review*, Aug. 29: West drift, first level, extended 10 feet. North drift, second level, extended 22 feet. Stopes producing some good ore.

DEL MONTE.—Stopes being opened south of the line are improving. Will resume work Monday at several different points.

NAVAJO.—Work has been resumed in the 250-foot level stopes, which are producing a good grade of ore.

NEVADA QUEEN.—The North Belle Isle Co. is pushing the drift on ore toward the line, which will he reached in four or five days; will then be turned over and run on company's account to develop the ore on 550-foot level.

NORTH BELLE ISLE.—The stopes on the 150-foot level are looking better. No. 3 upraise from 600-foot level extended 8 feet, no change. A crosscut has been started from the top of this raise toward the footwall and advanced two feet, all in vein. No. 2 upraise, 600-foot level, extended 13 feet, showing seams of fair ore.

BELLE ISLE.—No. 1 upraise above the 250-foot level bas been started, progress three feet, exposing four inches of high-grade ore. Have resumed work in the face of No. 1 crosscut same place. Water in the Navajo shaft is now down 46 feet below the 350-foot level.

NORTH COMMONWEALTH.—670 tons of ore sent to concentrator; 60,000 pounds of concentrates made, assay $171 per ton; 70 tons of first-class ore sent to the mill, average assay $229 per ton, tailings $12.63.

COMMONWEALTH.—Hoisted 328 cars of concentrating ore, car sample assays $19 per ton, assay of concentrates $781 per ton, assay of ore sent to mill $199 per ton. Bullion shipped $24,311.75. Crude hullion on hand about $12,000. The furnaces have been changed, all running and doing good work.

ARIZONA.

PLACER GOLD.—Prescott *Journal-Miner*, Aug. 27: Ed Wagoner is in from Walnut Grove to-day with a large supply of placer gold which he secured in exchange for merchandise. He says that placer miners are doing well in that section. Mr. Storms, of mining repute, left this morning for the Hassayampa, to resume operations on the Ohio claim, which is said to he very fine. Tim Hawkins' Rosa Lee mine was sold by the sheriff to-day to satisfy a judgment in favor of George Hagarty. The latter was the purchaser. N. J. Hyde, who has been engaged in mining on Cherry creek district, says that himself and partners have an excellent prospect there, and will shortly erect a mill for the reduction of the ore. Two very fine specimens of ore from the Senator mine are on exhibition at the Fashion saloon. One is from above the 600-foot level, and the other from above the 500-foot level. Machinery for the new large hoist of the Congress mine passed through town a few days since. The Ryland Co. at Minnehaha will shortly put in a chlorination plant to work their concentrates. The Kansas City M. Co. has just received a steam drill, which will he put at work as soon as it can he placed in position on the Silver King mine, and the shaft will be sunk as rapidly as possible to a depth of 500 feet. The rapid rise in silver has given quite an impetus to silver mining again. Many properties in this section can now he worked at a profit that would not pay expenses before. Geo. B. McCann received a ton of onyx from the Big Bug mine, a few days since, which he has forwarded to California.

MOHAVE NOTES.—*Miner*, Aug. 30: Work on the Empire shaft is progressing as well as could be expected, owing to the nature of the ground. The leasers on the mine are doing well. Samuels and Krause, who have a lease on the Jeanette, south of Hackberry, are taking out some good ore, and will soon have a carload ready for shipment. Twiggs & Kelley have taken the contract to run 200 feet of drifts on the Esmeralda mine. The contract is at good figures, and they expect to make a good stake out of it. The mill of the Music Mountain Mining Co. in Wallapai valley is completed, and on the arrival of a few additional pieces of new machinery, the mill will he put in operation. Carey and Merrill have a carload of ore at the Kingman Sampling Works from the Cactus, south of Hackberry. They have been at work on this property for some time, and have considerable ore yet in sight.

COLORADO.

SILENT FRIEND SALE.—Aspen *Times*, Aug. 26: M. Murphy has sold his interest in the Silent Friend, at Pitkin, to the other members of the company. He held a one-eigbth interest, which practically cost him nothing, as he was the promoter of the enterprise. The amount realized by bim from his connection with the property reaches a handsome figure, it heing variously estimated at from $10,000 to $15,000.

THE PARK CLAIM.—A plant of machinery is heing erected on the Park claim on Richmond hill by John Scott and party, who have secured a lease on it. They intend to push development work vigorously and will spare no expense that may he needed to make a mine of it. The property helongs to Wm. O'Brien, Brennan Bros., Toomey Bros. and others.

DAKOTA.

TIN AND GOLD. — Deadwood *Pioneer*, Aug. 28 While at Bear gulch last Saturday, Inspector of Mines Corkhill saw tin and gold taken out of the same rocker. The gold was what is known as coarse

placer and the nuggets of tin were about the size of an English cherry.

UNION MINING CO.—The directors of the Union M. Co. held a meeting yesterday and levied a small assessment sufficient to do representation work. The company owns two claims on Fantail gulch that promise to develop into good properties.

NIGGER HILL AND BEAR GULCH.—Inspector of Mines Corkhill returned last evening from an official visit to this district. He is firmly convinced that Nigger hill has un in paying quantities. At Bear gulch he found about 40 men engaged in placer mining, or rather rocking, for gold, as the stream does not carry enough water to run a sluice. Everything in the camp reminded him of early days in Deadwood gulch, as every miner carries his buckskin bag of gold, and dust is the currency of the camp. The miners only work about five hours a day, but they clean up as high as $30 per man per week. They take their dust to the store, exchange it for goods and leave the balance on deposit, or to be shipped to Deadwood by the store-keeper. The majority of the miners have been in the camp for 10, 12 and even 14 years. They work their claims six or seven months in the summer season, and then some of them take life easy until the following spring opens, while others spend the winter developing tin or gold and silver quartz claims.

IDAHO.

YREKA DISTRICT.—Wardner *News*, Aug. 26: The air compresser of the Last Chance mine was started on last Sunday and is now working very smoothly. A night shift will be put on to-morrow in the concentrator and in future the mill will be kept going day and night.

GOVERNMENT GULCH.—Work was resumed on the Silver King group of mines on March 23d, and since then operations have progressed without interruption. For the last five weeks two shifts have been employed day and night and during the last two weeks a body of good galena ore was encountered on the lowest level, four feet wide. This group of mines consists of the Silver King, Silver Queen and Merry Fraction. They are owned by H. A. Jones, William Merry, George Gardiner, O. L. Shankland and George Cox. The ore chute is exposed for a distance of 80 feet in length and 40 feet high.

LOWER CALIFORNIA.

OUR MINERAL RESOURCES.—*Lower Californian*, Aug. 20: A miner who recently came into Ensenada from a prospecting trip which extended over a large part of the country between here and the Gulf and as far south as Valladares, likened the peninsula of Lower California to one immense ledge of quartz, the monotony of which was only relieved here and there by an emerald valley upon whose bosom the ingenuity of man will ere long cause the semi-tropical products indigenous to this latitude to flourish in luxurious abundance. It is his belief, he said, that in the years to come the doors of this storehouse of mineral riches must yield to the pressure of human perseverance and disclose to the world the greatest mineral wealth that has yet been uncovered. It is an era that will surely come. There is not a portion of Lower California of any notable area that has not some mineral or plant for which there is a constant demand in the markets of the world. We have here gold, silver, copper, chromium, iron, antimony, onyx, carnelian, asbestos, mineral paint, hemp, henequen, talc, salt, and other products which await the advent of capital to become thriving industries.

BELOW CEDROS ISLAND.—Vincent Wallace of San Diego came up on the Pacheco last Monday from Cedros Island. He has been prospecting for gold and silver on the island and on the mainland. With other prospectors he lately went down to the coast in the schooner Queen a distance of 150 miles south of the island, and reports having found several fine prospects, besides five or six magnificent sulphur springs. The latter were located about 12 miles back from the coast and were fully appreciated by the men, for it was the first fresh water they had encountered since leaving the island. Mr. Wallace describes the coast of the peninsula south of Cedros as extremely desolate, the foothills being back some distance from the shore.

MONTANA.

CASTLE DISTRICT.—Anaconda *Review*, Aug. 28: In Castle district there seems to be an increased activity in the development of properties that have shown themselves good for anything. New companies are being organized and work is being prosecuted as rapidly as possible on numerous claims. Among the new companies are the Myrtle, Monte Cristo and the Southern Castle. The Cumberland Co. has commenced a three-compartment shaft from which the various properties of the company will be worked. Manager Belden of the Red Lion was in town Tuesday on his way to Butte with a fine retort of gold, about 90 fine, the result of three or four days' run of the mill. The retort represented $500. The company is running the ten-stamp mill in its fullest capacity and is getting good results. About 20 men are at work in the mine.

DUNKLEBERG.—Another good strike is reported to the *Mail* in the Dunkleberg district this week. It is on the Pioneer and Annie lodes, which are under lease and bond to A. P. Morgan and Wm. Funk. The strike was made in the 300-foot level of the Jackson shaft. They have started a new shaft and are down about 24 feet, and have an 18-inch vein of good ore in sight. The ore will average 40 to 50 ounces, and the lessees in consequence feel quite jubilant over the discovery. They now have about eight or nine tons of ore on the dump. Their lease runs for 12 months and they have the privilege of purchasing it at a given price if they feel that the showing attained will warrant it.

ORO FINO.—In the Oro Fino district there is but little change in the status of affairs. The Champion is shut down and the minority of the stockholders are dissatisfied with the present management of affairs, as they believe that they have a good mine and one that can be profitably worked. The debt of nearly $60,000 could have been discharged, they believe, if the mill had been kept running. The Oro Fino has cut its ledge at 325 feet and has a ledge of 40 feet at this level and eight feet of good sulphuret ore. The Lion management is booming business, and it is expected that the crosscut which is now being run from the 300 level will strike rich ore in a large body. The Keystone has struck ore at 100, but finds its money gone and the mine attached by operatives. Its stock is non-assessable and the directors are in a quandary. Profiting by the experience of the Keystone Co., the Silver Crown Co. are arranging to change their stock to the assessable form.

NEW MEXICO.

PINOS ALTOS.—Cor. *Southwest Sentinel*, Aug. 26: From Capt. Porter and Charles Anderson, the men in charge, we learned that the Mammoth Co. had a large force of carpenters at work on its new roller-mill, and it would be completed and crushing 80 tons of ore per day 40 days from date. They told us that the perpendicular shaft, the largest in the camp, was down 60 feet, at which depth the miners were working in five feet of ore. Placer diggers are taking advantage of the abundance of water afforded by the heavy rainfalls, and working their locations with great activity. About 30 Mexicans are engaged in the placers and they bring into town nearly $100 each day in gold-dust.

OREGON.

ROBINSONVILLE AND GRANITE.—Baker City *Democrat*, Aug. 26: A visit to the mining districts of Robinsonville and Granite at this time of year would indicate a state of lethargy to the one expecting to see extensive operations going on, but this is entirely owing to the lateness of the season and the shortage of water, thus preventing the many and extensive placers of these districts to be worked to advantage. But inquiry would at once develop the fact that the season of mining just closed has been a most profitable one to mine-owners, the output reaching in excess of former years. In quartz mining, operations are in some instances quite active and development work on the various properties is progressing with most favorable promise, and the future of these camps is highly encouraging. One great drawback to progress is the lack of capital.

GREENHORN DISTRICT. — *East Oregonian*, Aug. 26: Frank Duprat and Andrew Larsen have returned from the Greenhorn mines and report as follows: One of the tunnels on the Cabbelle mine is 936 feet in length, showing up a seven-foot ledge of fine silver quartz. The recent purchasers are preparing to put in a new process for reducing ore, and to conduct developments on a large scale. The Cabbelle is surrounded on the same hill by a number of fine prospects. Passing the Monumental, we stopped at the Buffalo M. Co. A tunnel has been driven 325 feet and another 275 feet. The quartz is hard to work, but a large ledge is being developed. En route to Granite and Robinsonville we find a good many placer mines in operation. The Mitchell mine at Robinsonville is one of the richest in the district. From Robinsonville to Greenhorn camp there are any amount of good claims. The Ruby mine, owned by Collet, Burke & Co. from Salt Lake, has perhaps more developments than any other mine in the district, consisting of open cuts and shafts and a 50-foot tunnel, showing up large bodies of high-grade ore, some samples assaying $1800. Billy Morris is the owner of a fine prospect for which it is said he refused $35,000. Schnarr & Pratt own one of the richest mines in the district. They have a good many tons of high-grade ore on the dump which it would pay to ship, even at the great cost of transportation. The Portland M. Co. have some splendid properties and will in the near future employ a full force of men in the work of developing the Silver King and other mines. W. M. Turner, Ben Durham, Andy Larsen, B. L. Duncan, A. O. Beach, G. T. Fraokum, a company known as the French boys, and Jack Powers & Co., all have good locations and are busy doing assessment for this year. Taylor Althouse, Dr. Boyd, D. B. Thompson, J. Reno, Marcellus and Peter Gagnon, J. Banberger, John Murphy, H. Richardson, I. French, Dart & Co., B. G. Dunning, F. Bernard and others have good claims, and are well satisfied with the returns from the assay office.

UTAH.

REVIEW.—Salt Lake *Tribune*, Aug. 29: The week has been a good one in mining circles. Silver keeps up and lead also, and miners are going into their work with more heart than ever. But more than half the year passed under depression, and that the best part of the year for origioating work, so that the rise in values will not have the marked effect in the production of the year that many have been anticipating. With its drawbacks, however, next year bids fair to be the best in the history of mioing in all this interior region. The receipts of the metals in this city for the week were to the value of $184,874 in total, of which $104,114 was in ore and $80,760 was in bullion. For the previous week the receipts were $241,906, of which $149 309 was in ore and $92,507 was in bullion. The product of the Ontario for the week was of bullion 22,300.45 ounces; ore sales, $14,880.57, an approximate total of $37,181.01. The Horn Silver stock is having another small boom in New York. Nothing new is known of the mine; its average product runs about as heretofore. Bullion receipts in this city for the week were to the value of $25,720; silver bars, $18,000; selected lead, $4540. The product of the Hanauer smelter for the week was $32,500 in bullion. Ore receipts for the week were to the value of $21,778 by Wells, Fargo & Co.; $56,441 by McCornick & Co.; and $25,895 by T. R. Jones & Co.

WASHINGTON.

CONCONULLY.—Okanogan *Outlook*, Aug. 26: A six-inch vein of rich ore was struck in the north drift from the 200-foot level of the Arlington yesterday. The Fourth of July company have decided to continue their double-compartment shaft down to the 500-foot level. The Bunker Hill mine on Palmer mountain has been bonded by California parties. The new buildings at the Lone Star are nearly completed, and development work, which had been suspended for the past month, will soon be commenced again and prosecuted more vigorously than ever. Supt. Webb is pushing things on the Arlington mine. The steam hoist is now in operation, and the work of sinking the double-compartment shaft is progressing rapidly, notwithstanding the hard character of the rock they have to contend with.

Mining Share Market.

The mining share market has been decidedly mixed, but not more so than have been the chipping public. Andes made quite a jump, moving up to over $2 a share, said to be on a short interest. Con. Virginia and Ophir held strong up to Friday, while Savage went down, as did Potosi and the Gold Hill stocks. On Monday and Tuesday the market was dull at shaded prices, with Andes falling off over one dollar a share. At the 2:30 session on Tuesday, Ophir showed more strength, which was followed on Wednesday by stronger prices along the line, closing the day at a decided advance, particularly in Potosi and Bullion. The market acts exceedingly well for a hull movement.

In outside stocks trading has been light. There are reports of dividends by one or more of the Tuscarora companies, which is fully offset by reports of a line of assessments soon.

There do not appear to be any signs of the moneyed public, merchants and the like, buying stock, but all indications go to prove that they are selling when offered an opportunity to do so without netting too much of a loss. It is claimed by those in position to know, in this course they are largely influenced by being disappointed for years past in not getting dividends, but instead assessments. To this disappointment is added the mines are worked in the interest of a limited few. This belief is made stronger by undenied published statements that ore has been taken out of one of the mines (Hale & Norcross) assaying from $50 to over $400 a ton, and when milled only about $20 in bullion is returned, compelling an assessment or two so as to cover expenses. The public reason that if it is done in one mine it is likely to be done in the others. Until the mines are run differently, well-informed persons only look for small deals.

We are in position to affirm that there is a contest for the control of Con. Virginia. As the election is to be held in next month, quiet buying by some Eastern parties has been going on for some time past. What gives additional color to the statement is the fact that the stock is exceedingly scarce with brokers, having been bought by strong parties and withdrawn from the market. An additional evidence is witnessed by the management not paying dividends, although it is said that the company can do so if desired. Not only are there no dividends, but the past week the mine was shut down so as to repair a dam to one of the mills. Heretofore, when the mills are repaired, active prospecting in the mines is carried on.

An effort is being made by a few members of the San Francisco Stock Exchange to have an investigation made of the charges preferred by the Mining Stock Association against the management of the Hale and Norcross mine. The New York *Engineering and Mining Journal* of a recent date says "that on exchange in the United States would allow such charges to be made without a thorough investigation." It is to be hoped that the San Francisco Exchange will not be an exception. If the mine is honestly worked the management ought to court an independent investigation, so as to allay any and all suspicions of dishonesty.

Water-Pipe Manufacture.

We learn from the Sacramento *Record-Union* that there is a strong prospect of a new and important industry being established in that city, that of the manufacture of sheet-iron pipe for conducting water. The enterprising firm which is contemplating this step is that of Schaw, Ingram, Batcher & Co., which recently purchased the extensive hardware business of Helbron & Co. They last week took a contract to supply two and one-half miles of 22-inch pipe for the Golden Feather Channel Co. of Butte county.

In the manufacture of this piping the firm will consume no less than 20 carloads of sheet iron, and the material will soon be on hand and the work commenced. The fulfillment of this contract involves an expenditure of something near $40,000, a large portion of which will be paid out for labor.

The work of carrying out the big contract referred to will serve as the nucleus for a plant to manufacture iron piping, and an enterprise of that character will be permanently maintained by Messrs. Schaw, Ingram, Batcher & Co., in connection with their extensive hardware business.

The work will be done under the supervision of Floyd Taber, who had charge of the manufacture and laying of the water-pipe in the Orangevale Colony near Folsom.

The firm shows commendable enterprise in securing the contract referred to and for its proposed establishment of a permanent factory in Sacramento.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

H. KELLEY—Modoc and Lassen Cos.
T. M. STACKER—Sierra and Plumas Cos.
T. B. LESIEUR—Humboldt Co.
J. W. PURDY—Sonora, Cal.
GEO. WILSON—Sacramento Co.
J. P. QUINETTE—San Francisco.
J. C. HOAG—San Francisco.
SAMUEL CLIFF—San Luis Obispo Co.
W. W. THEOBALDS—Orange and San Diego Cos.
C. J. WADE—San Bernardino Co.
J. H. CROSSMAN—San Bernardino Co.
JOHN B. HILL—El Cajon, Cal.
E. B. TAFT—Clements, Cal.
E. H. SCHAEFFLE—Calaveras Co.
O. N. CADWELL, Carpinteria, Cal.
WM. M. HILLEARY—Oregon.
JOHN SIMPSON—Oregon.
WM. HOLDER—Oregon.
R. G. BAILEY—Washington.
A. S. ROBERTS—The Dalles, Oregon.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUG. 26, 1890.

434,971.—RAILWAY BRAKE—A. F. Baatz, Bellingham, Wash.

435,274.—SOLDERING IRON—F. Barr, Tacoma, Wash.

434,916.—TRANSMITTING POWER—E. Chaffey, Santa Monica, Cal.

435,020.—STREET CAR MOTOR—F. M. Merrill, Oakland, Cal.

435,026.—TROLLING SPOON — H. E. Skinner, S. F.

The following brief list by telegraph, for Sept. 2, will appear more complete on receipt of mail advices:

California—Joe S. Blood, assignor of one-half to F. Manasse, Napa City, knife-sharpener; John M. Bryant of San Francisco, assignor to P. A. Deane, Oakland, ore-crusher; Stephen H. Chase, San Jose, continuous sectional chimney; Ferdinand Frank, Suisun, clothes-drier; George Gates, Drytown, concentrator; Carleton C. Harris, Chicago, Ill., assignor to A. N. Bartlett, Salida, automatic fire-kindler; David B. James, San Francisco, plate or pan lifter; Paul Malsonnsude, Oakland, fruit-stoning machine; Washington Man, Fresno, insecticide; Alfred F. McMillan, assignor to Benicia Agricultural Works, Benicia, gang-plow frames; John L. Notley, Santa Cruz, decorating machine for removing oil or covering from office; Fred H. Smiley, San Jose, journal bearing. Oregon—Joseph Albers, assignor of one-half to J. Zeis, Corvallis, gate; Jennie A. Shepard, tassil-reel for winding skeins of zephyr, etc. Utah—Thomas Delamare, Toole City, axle-skein; Rebecca M. Henshaw, Salt Lake City, clothes-hook.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TROLLING SPOON.—Henry E. Skinner, S. F., assignor to Edward T. Allen. No. 435,026. Dated Aug. 26, 1890. In the manufacture of trolling spoons for fishing it is customary to employ highly polished nickel, silver, or otherwise coated metal, and the hooks are suspended at one end, while the line is connected by a swivel-joint with the opposite end. These spoons naturally become easily tarnished and lose their effectiveness. Iridescent shells have also sometimes been used for this purpose, but they are of an exceedingly brittle and friable nature and have not sufficient strength to form a proper connection between the hooks and the swivel to which the line is attached. In this invention the spoon is made of mother-of-pearl, abalone or other naturally iridescent substance the surface of which does not tarnish. These substances are not naturally strong enough to resist the strain brought upon the line by a heavy fish, and the spoon is therefore strengthened by a reinforcement of metal which is fixed to the spoon. The little bar or band of metal extending across the spoon forms a strong connection between the swivel and the hooks, and it is so small that even if it tarnishes it does not materially affect the use of the spoon, which, being of iridescent shell or material, always retains its bright appearance. Since this spoon was invented by Mr. Skinner it has been adopted by large numbers of expert anglers, who pronounce it very satisfactory in every way.

COMPRESSED AIR STREET-CAR MOTOR.—Frank M. Merrill, Oakland. No. 435,020. Dated Aug. 26, 1890. This invention relates to that class of street-car motors in which the car-frame carries a suitable tank as receiver for compressed air and from which the air is drawn by suitable communications and admitted to the driving cylinders. The invention consists essentially in the provision of a series of communicating cylinders intermediate between the driving cylinders and the compressed-air receiver in which the air is allowed to expand from the excessive degrees of compression which it has in the receiver down to the necessary compression for use in the driving cylinders; and in connection with said expansion cylinders is one or more air-compression cylinders, the pistons of which are operated by power derived from the expansion cylinders—said air-compressing cylinders being peculiarly arranged with respect to the expansion cylinders and adapted to direct what air they compress into the driving cylinders to act in conjunction with the compressed air. The essential object of the invention is to utilize the expansive force of the compressed air which is being necessarily reduced from the high degree of compression in the receiver to the compression adapted for use in the driving cylinders by making said air during this course of operation useful in compressing more air; and another object is to provide against the excessive refrigeration of the parts due to the tremendous expansion which takes place as the air is being reduced from its original compressed state to a state necessary to work the cylinders.

SASH-FASTENER.—Benjamin Marshall, S. F., assignor to the Marshall Improved Window-Furniture Co. No. 433,600. Dated Aug. 5, 1890. This is a novel catch for sash locks. The object of the invention is to provide a simple and effective means for operating any sash lock or catch which employs a detent or pawl adapted to be projected and withdrawn in order to effect the locking and release of the sash.

THE breakage of the South Yuba ditch, Nevada county, caused a failure of water for power and a temporary cessation of work in the Grass Valley mines this week.

MECHANICAL PROGRESS.

The Mannesmann Process.

The Mannesmann process of manufacturing boiler tubes, which was described fully in one of our late issues, appears to be giving the most perfect satisfaction. *Engineering News*, in a late number, furnishes the following interesting facts in regard to the great superiority of these tubes in strength over those heretofore in use:

For the purpose of comparing the ultimate tensile strength of a Mannesmann and lap-welded boiler-tube, two small bottles made of such tubes were filled with boiling water and then placed in a freezing mixture. The lap-welded bottle burst, but the other remained intact.

Another Mannesmann tube, 1 inch in internal diameter and 3 64 inch thick, was subjected to an internal pressure of 3.6 tons per square inch at the Siemens Bros. works at Onalton, without injury. When removed from the testing apparatus it was distinctly warm to the touch, but otherwise exactly the same as before the test. The power of resisting great internal pressure makes the tubes particularly well adapted for vessels made to contain gases at high pressure.

At the Mannesmann works at Komotau, Hungary, more than 600 tons of 3 inch and 4-inch tubes averaging ¼ inch in thickness have been successfully tested to a pressure of 2000 pounds per square inch. These tubes were intended for a high-pressure water-main in a Chilian nitrate district. But the severest test to which the Mannesmann tube can be subjected is the process of manufacture itself. If the metal is homogeneous throughout and well melted, well rolled and carefully heated, it makes a practically perfect tube; but if there is any flaw in the bar, or if the furnace-man has been careless in the heating, then the Mannesmann rolls reject that bar, by refusing to make a tube of it, more surely than a human inspector would do.

This great tensile strength is probably due to the fact that, in addition to being much more worked than most metal, the fibers of the metal run spirally, as has been frequently proved by microscopic examination. The result of this increased strength is a great diminution in the weight of the tubes. While cast-iron tubes will hardly stand more than 200 pounds per square inch, and welded tubes are not safe above 1000 pounds per square inch. the Mannesmann tube easily withstands 2000 pounds per square inch, as already mentioned. The length up to which they can be readily made is shown by the fact that a coil of 3 inch tube 70 feet long was made recently.

Prof. Reuleaux, who undoubtedly ranks as the greatest mechanical engineer in Germany, closed his address thus:

"It is undoubtedly true that we have in the Mannesmann process an epoch-making invention; it is certain to bring about a great change in rolling-mills; it has, indeed, already had a deep influence on rolling processes."

Labor-Saving Machinery and Wages.

Half a century ago, when skilled labor meant hand labor in the fabrication of wool, cotton, leather, wood, iron, copper, lead and the precious metals, there was a superstitious hostility among the laboring classes to the invention and introduction of labor-saving machinery. Steam-power for purposes of transportation drove out of employment thousands of men on rivers, lakes and canals trained to the slower modes of navigation, and other thousands more on land engaged in passenger and freight transportation. The power loom, the cotton gin, the power printing press, the fanning-mill, the threshing machine, the reaping machine, the automatic seed drills, corn-planters, corn-huskers, etc., each in its turn jostled hand labor out of employment and was regarded by the laborer as an interloper and an enemy. Each invention has proven itself a benefactor to the laboring classes as well as to the general public. If there were no other mode of testing results, it could be found in the comparison of wages received now by laborers and those received before the advent of labor-saving machinery. Of the latter period the *Mining Herald* speaks as follows:

Let us compare the wages of those days with the wages of to-day. In 1793 the Schuylkill & Susquehanna Canal Company advertised for workmen, offering $5 a month for the winter months and $6 for summer, with board and lodging. The next year there was a debate in Congress which brought out the fact that soldiers in the regular army were paid $3 a month, and when it was proposed that their pay should be increased to $4, Mr. Wadsworth of this State said: "In the States north of Pennsylvania the wages of the common laborer are not, upon the whole, superior to those of the common soldier."

Matthew Carey, in his "Letters on the Charities of Philadelphia" (1829), gives a painful picture of the working classes at that time. Every avenue of employment was choked with applicants. Men left the city to find work on the canals at from 60 to 75 cents a day, and to encounter the malaria, which laid them low in large numbers. The highest wages paid to women were 25 cents a day, and even women who made clothes for the arsenal were paid by the Government at no higher rate. When the ladies of the city begged for an improvement on this rate, the Secretary hesitated, lest it should disarrange the relations of capital and labor throughout the city. Poor people died in cold and want every winter in the city, and the fact seems to have made an impression only on benevolently disposed persons like Mr. Carey.

The English Iron and Steel Institute.

A very important and unique event in the history of the Iron and Steel Institute of Great Britain will be the manner and place of its next annual meeting. This meeting will take place in the City of New York. The session will commence on Wednesday, October 1st, and will continue three days.

Previous to this meeting, the American Institute of Mining Engineers will hold sessions, also in New York, on the 29th and 30th days of September, to which the English Association is invited.

After the holding of these sessions, there will be an International meeting of the two bodies on the 9th and 10th of October, at which papers will be read by members of both bodies. Among the papers to be read by the English visitors will be one on "The Protection of Iron and Steel Ships Against Foundering from Injury to their Shells, Including the Use of Armor," by Sir N. Barnsby, K. C. B., London; another on "The Recent Development of Marine Engineering," by Mr. A. E. Seaton, Hull.

Sir Lowthian Bell has also been asked to prepare a paper embodying his views on the present state of the iron manufacture.

The program of the New York Institute embraces a list of ten papers.

Several local excursions will take place between the several sessions. After the sessions are closed, an extended excursion has been arranged for which will embrace visits to all the leading iron works and iron-mining localities in the Northwestern and Middle States. The excursionists will go as far west as Lake Superior and south to Washington.

AMERICAN BUILT CARS FOR EUROPE.—The Jackson & Sharp Works at Wilmington, Del., are building passenger-cars for railways in France, Spain and Austria. Mr. William Voss, writing about the cars after a visit to the works, says: They are a curious mixture of European and American practice, and are built according to complete sets of drawings sent over. Of course it is sectional work, like that sent to South America. These cars are about 50 feet long, some of them day coaches and others of the Mann boudoir style of sleeper. They have combination wood and iron sills, bogie trucks, the old-country drawhook and buffers, etc. All the heater and water pipes are of copper, windows run in brass guides (a very good but expensive thing). There is a vestibule at each end, but they do not touch like ours, being about four feet apart when coupled, and iron aprons and railings form the bridge. The entrance is through the vestibule with steps, like ours, but different. The exterior is mahogany, natural-wood finish. Roof much like ours, and is covered with canvas and sheet copper on ends and eaves. Some of the cars have been shipped, six or 12 more are almost done, and a lot of six is just being erected. *Locomotive Builder.*

HEAVY RAILS.—Rails weighing no less than 200 pounds to the yard are in contemplation by the Metropolitan (underground) railway of London. They will be of the bulb-head section, of course. Like other English railways, the Metropolitan finds its third-class traffic enormously increasing, while its first-class is of insignificant proportions. In the past year there was an increase of 21,900 first-class passengers, 68,400 second-class and 584,000 third-class. The latter were carried at an average cost of 1½ cents. The managers think the use of one class of carriages only, with a separate compartment for the aristocracy, will soon become advisable.

ORDERS FOR LOCOMOTIVES.—Among other orders recently received by the Baldwin Locomotive Works are 30 for the Manhattan, 32 for the Union Pacific, 27 for the Northern Pacific, 48 for the Denver & Rio Grande, 12 for the Chicago, Rock Island & Pacific, and 20 for the Baltimore & Ohio. Of the latter, three will be high-speed passenger locomotives with cylinders 20x24, and driving-wheels 78 inches in diameter. Three locomotives for the railroad from Jaffa to Jerusalem, in Palestine, were shipped from those works on July 16th.

STEEL AND WOODEN TIES TO BE CONTESTED. Steel cross-ties have been laid on three-fourths of a mile of the Delaware & Hudson Co.'s track near Saratoga Springs, N. Y., by the Standard Metal Tie and Construction Co. They weigh 90 pounds each, and were laid about 2.6 feet apart, the rails being supported on creosoted blocks placed in a recess in the tie. A parallel track has been laid with new Georgia pine ties, in order to compare the two systems when subjected to equal wear.

A NEW MINING DRILL has just been made which weighs 200 pounds, and which, it is claimed, will bore through the hardest granite at the rate of one inch per minute. It is called an electric percussion drill and delivers a dead-stroke blow at the rate of 300 per minute, with a force of 400 pounds per blow.

SCIENTIFIC PROGRESS.

Germany's New War Rifle.

If one-half of the reports are true, M. Paul Giffard, a Frenchman and an inventor of scientific reputation, has brought out a new and most remarkable improvement in firearms, which, in battle, must prove so destructive of life as to render warfare nothing less than carnage. The inventor has long been so well known by his pneumatic tubs, his "Giffard's injector," so generally used in connection with steam-power, and other important inventions, that any device emanating from his skill and genius would be everywhere considered worthy of the most serious consideration.

The weapon now introduced by him is something more than an ingenious appliance; it is a discovery which not only promises to revolutionize the gunmaker's art, but it is thought will also be applicable as a motive-power. Those who are interested in the Giffard gun claim that it will become the military weapon of the future. The idea of using liquefied carbonic acid gas as a propulsive power is not new, but M. Giffard is the first who has turned it to practical account.

The gun is said to be a model of mechanical simplicity, so simple that it can be readily attached to many of the rifles now in use. It presents but few peculiar characteristics to distinguish it outwardly from an ordinary breech-loader except a long steel cylinder which is screwed under the barrel just in front of the trigger and containing the liquefied gas. In the simple pea-rifles or carbines not adapted to the repeating system the bullet is inserted in a round slot in the upper part of the breech and falls into a small chamber, where it is kept in position by the action of a spring. On pressing the trigger a drop of liquefied gas escapes from the steel cylinder into this chamber, and at the same time the bullet is pushed slightly forward in the bore, so as to receive the full force of the evaporating liquid.

There is no louder report than that produced by the drawing of a champagne cork, no smoke, and no fouling of the barrel. In all these respects M. Giffard's gas gun seems to fulfill the requirements of an ideal weapon for warfare. In some recent experiments in the presence of military experts, when the guns were discharged a rush of vapor was seen issuing from the muzzles, but it instantly faded away and the bullets flew with strict precision to the targets. Barrels which had been repeatedly discharged in the previous two months were shown to have suffered no corrosion. The preparation of the liquefied gas involves no mechanical power, but the needful pressure is got entirely by the chemical manipulation of ordinary substances, such as carbonate of soda—so says London *Engineering*.

There is scarcely any possibility of untimely or dangerous explosion. There is very little or no recoil, so the gun need not have any special weight. It can be discharged over 100 times in a minute.

The gun has already been ordered for the German army. Experiments have given it a range of 3000 yards. The ball penetrates dry deal 32 inches at a distance of 110 yards; at 440 yards, similar wood, 18 inches thick; at 800 yards, 10 inches; at 2000 yards, 2 inches; and at 330 yards, iron plates 7·25 of an inch thick. The depth the shot penetrates into newly thrown up sand amounts, at 110 yards, to about 36 inches; at 440 yards, 20 inches; at 880 yards, 14 inches.

The gas cylinders can be readily filled on the battle-field, and the gun and its equipments will not exceed the weight now ordinarily carried.

The French are also considering the propriety of giving up their cherished Lebel repeaters for this new weapon. The cost of such a gun as would be required for army use would not exceed $5. If what is claimed for it is anywhere near the truth, it must bring about an entire change in military tactics and make war, as already said, nothing but wholesale massacre. It is claimed that in the hands of thoroughly drilled and steady men, every bullet ought to hit within a range of 280 to 380 yards.

The extraordinary qualities of this new rifle make it apparent that even quite stout trees will be no shelter in the future, as the bullet passes right through them, and furthermore, that one bullet can pass through several men, the only consolation left to the soldier being that the hole made is very small.

AFRICA YET MUCH UNKNOWN.—Sir Francis de Winton, late Governor of the Congo State, says in spite of the scores of explorers who have been traversing Africa in all directions since Livingstone began his travels, the larger part of the many millions of natives have never yet seen a white man. As we trace the routes of explorers on the map we see that their tracks make merely a network over Africa, and that there are enormous unvisited spaces between the lines. As yet we can only infer what large regions and the people who live in them are like from the reports of perhaps a single traveler who has hurriedly passed through the country. As an evidence of the much unexplored country that may yet be discovered in that continent, Stanley says that during his recent expedition he came across a new and interesting race, the Wanoumas, who were absolutely European in type and very intelligent. They appeared to be descendants of the ancient Ethiopeans, who settled in some way not known to him in equatorial Africa. These people never intermingled with the aboriginal races, but kept their blood intact, considering the ordinary negroes beneath them. Possibly it was over this race that the beautiful Ethiopean queen of sacred writ once ruled.

A CURIOUS EXPERIMENT.—Several years ago a curious experiment was tried by an English engineer. He took a large funnel fitted with a stop-cock, and screwed the pipe into the top of a boiler containing steam of about 40 pounds pressure. He then filled up the funnel with cold water and opened the stop-cock. It would naturally have been predicted that the steam would have blown all the water out of the funnel. It did nothing of the kind. On the contrary, the water rushed into the boiler. As a result of this and several other experiments, a boiler-feeder was designed and patented, and worked with tolerable success. It was found, however, that it was not certain in its action, and the injector coming into high favor at the time, the inventor spent no more money on his ingenious idea. The inrush of water was due to the fact that the steam condensed in the long pipe of the funnel, and water hammer-action then drove the water into the boiler. Practically, just below the cold water there was a vacuum into which the water was driven by its own weight and pressure of the air.—*Exchange.*

ELECTRICITY IN THE CAR AND SICK-ROOM.—There seems to be a belief among some electricians that some system of utilizing the electric spark for clarifying the atmosphere of railway cars will, in the not distant future, be applied. An electrician the other day said: "A simple and almost perfect method for purifying the atmosphere of crowded apartments, such, for instance, as railway cars, is to produce ozone by electrical sparks, and the practice has been strongly recommended by the highest medical authorities. The delightful freshness and vigor which is perceptible in the air after a series of sparks from an ordinary influence machine, is a proof of the salutary and refreshing influence produced." In connection with the above it may be remarked that a physician in Philadelphia has taken a very wise step in the introduction of a small electric machine for the production of ozone. It is in a compact form, operated by a small battery, and can be conveniently carried. There is said to be a large demand for the machine for purifying the sick-rooms of private patients.

A SNOWSTORM ON MARS.—Prof. Pickering has of late been making very close observations of the planet Mars. He took 14 photographs of that planet on the 6th and 7th of April last at about equal intervals of time apart, in regard to which he made, in substance, the following announcement: The white spot covering the south pole is plainly visible on all the negatives, but was conspicuously larger on the negatives taken near the close of the second day than on the earlier ones. The natural inference is that during those two days a large amount of snow must have fallen in the neighborhood of the south pole, covering that portion of the surface of the planet to so much greater extent that the increased area of the white spot was noticeably pictured upon the negatives; and we thus have information of a great snowstorm on the southern hemisphere of Mars.

THE HUMAN TOE AND MOUTH.—In the anatomical institute at Strasburg, it has been found that the small toe of the human race is retrograding and losing one of its joints. Among 50 small toes dissected, 14 had two joints instead of three. The Springfield *Union*, under the head of "Will the month ever bite the ear?" says: A Frenchman has discovered that the human mouth is gradually working its way around toward the left ear, and accounts for it by the invariable tendency of men to eat chiefly with the teeth on the left side of the mouth. This wears out the teeth on that side and gives the jaw a cant toward the left. In the course of a few ages it is believed that the mouth will approach the left ear, and there is some danger, if the process keeps on long enough, that it may get around to the back of the neck.

A NEW METHOD OF PRODUCING ELECTRICITY. The accomplishment of a hitherto apparently impossible feat—the useful transmission of mechanical work directly into electricity—is claimed by Prof. Braun of Tubingen. He winds nickel wire into spirals, and as each spiral is elongated or compressed a current of considerable strength is generated. This is increased by putting a number of spirals in parallel. Such positive results are stated to have been attained that the professor is hopeful of being able to construct a practical generator on this principle.

PHOTOGRAPHING AN OIL WELL.—An experiment was made in photographing the bottom of an oil well recently at Warren, Iowa. The instrument was let down a distance of 1700 feet. The moment it touched the bottom a bright flash lit up the cavity, and a perfect picture of the whole was impressed on the negative. It revealed, as the effect of the explosive shock, a cavity of 14 feet broad and 7 feet below sand. Rock, sand, pebbles and minute objects were distinctly revealed upon the plate.

Useful Information.

Damage from Lead in English Lace.—Ph. De Carmont gives an account in *Le Moniteur de la Teinture*, of a white satin dress totally ruined by its trimming with English lace. The dress had been worn but once, had then been packed into a trunk which was deposited in a damp place and exposed to emanations of hydrosniphuric acid from gas. When taken out, it was found that the pattern of the lace, particularly of its tulle ground, had been printed in indelible black upon the white satin. The accident was not difficult to explain. English laces is habitually charged with sulphate of lead, which in this case had absorbed hydrogen and hydrosulphuric acid from the atmosphere, forming sulohide of lead, which had been imprinted and fixed upon the white satin, which naturally had also absorbed hydrogon and hydrosnlphuric acid. The seller of the lace showed that charging English lace with white lead (sulphate of lead) was commercial usage, and thereby escaped paying the damage. An objectionable usage it is at any rate, as the absorption of lead through the skin from such lace may become dangerous to health.

Ocean Timber Rafts a Success.—The steam schooner Noyo, from Noyo, lately arrived at this port with a raft of 500 and odd piles in tow. They were consigned to the Southern Pacific Railroad Co, and are intended for the repair and construction of bridges on its lines. This is the sixth trip with rafts of the Noyo, and each of its voyages has turned out successfully, so says the *Pacific Lumberman*. The rafts are constructed one deep. They are made of lots of 30 piles each. The piles are bored through, and a chain passed around the lot. Each lot in its turn is attached to the main chain by which they are towed. The great Leary raft has also been safely moored in New York harbor, and it has been practically demonstrated that this means of transportation is feasible, yet it is hardly to be recommended from its attendant dangers to our shipping interests. Icebergs are bad enough, but are hardly less to be dreaded than would be such a raft if left floating about in the open sea.

A New Gas Detector.—Spongy platinum, as is well known, glows in a mixture of combustible gas and air; but hitherto no convenient arrangement has been devised for utilizing this reaction. H. N. Warren proposes to saturate asbestos yarn with a saturated solution of platinum oxalate, and then ignite it in a platinum crucible. This prepared yarn when heated to 80° F. becomes incandescent in an atmosphere containing 0.5 per cent of coal gas by volume, and by arranging it by the side of the wick of an ordinary spirit lamp, it is easy, by lighting for a short time, to raise the temperature of the yarn to the requisite degree, so that when the lamp is blown out it will become incandescent if there is any escape of coal gas in the neighborhood.

Shears and Scissors.—For a long time the difference between scissors and shears was determined by the former having two sharp points, and the latter one. This difference has gradually lost its determining technicality, and the shears of to-day are called so because one of the bows has room for three fingers. It is not always so, but shears are generally longer and of heavier weight than scissors, as would be implied by the necessity of the strength of using three fingers in the leverage. The cutting of stronger textures has led to a difference in the manufacture and general form of these articles of cutlery, but what determines the name is the fact of using three fingers or less than that number in one of the bows.

A New Motor Agent.—M. Giffard, the inventor of the "gas gun," noticed at length in another column on this page, is now engaged in discovering a means of adapting his system to machinery of all kinds, so that one of these days not only the steam locomotive but even the electric motor may possibly be supplanted by a Giffard liquefied-gas engine. Although the latter prophecy must be taken with the proverbial grain of salt, still the well-known character of M. Giffard, as a scientific inventor, gives good reason to hope for something as practical in the way of a motor, by his system, as we have already seen accomplished by him in gunnery.

What is Invention?—The late Judge Hall of the Circuit Court of the United States said: "An invention, in the sense of the Patent law, means the finding out, the contriving, the creating, of something which did not exist and was not known before, and which can be made useful and advantageous in the pursuits of life, or which can add to the enjoyment of mankind. In other words, the thing patented must be new; and it must be useful to an appreciable extent, though the measure of that usefulness is not material. Any degree of utility appreciable by a jury is sufficient, upon the question of utility, to sustain a patent."

Solid Petroleum.—That the commercial practicability of solidifying petroleum, upon which doubt was cast some time ago, is established, is proved by the exhibition of Prof. Millefleurs before a meeting of Parisian scientists, of several bricks of petroleum which he has produced by an original process. The bricks were hard enough to be handled without inconvenience, yet soft enough to be cut with a stout knife. They burned slowly when touched with a lighted match. Prof. Millefleurs claims that they are non-explosive and inexpensive.

Trusts and Prices.—The trust idea in business operations is unique and catching, and is by no means confined to this country. It now appears that a syndicate of French dry-goods merchants in Mexico has bought up the entire output of the cotton-print mills of that country until January next and raised the price 30 per cent.

A Fine Odor for Rooms.—If you want a lovely odor in your rooms, break off branches of the Norway spruce and arrange them in a large jug well filled with water. In a few days tender, pale-green branches feather out, soft and cool to the touch, giving the delightful healthy-giving odor.

During the heated spell a few days ago, workmen removed a street-car rail at Reading, Pa., and it expanded so much that it could not be put back in its place.

A Patentee is protected from the use of all plans or devices which, however seemingly different from the patented invention, are the same in principle and operation.

Rubbing with salt and vinegar brightens brasswork.

Good Health.

Deaths Under Five Years.—The following facts, which we quote on good authority, certainly show the necessity for sanitary missionary work as a life-saving means in the principal civilized nations of the globe: "In Norway the proportion of children dying under five years of age is 204 5 per 1000 born, while in England it is 330 per 1000, and in Italy it is 567 per 1000. In 51 so-called 'healthy districts' of England and Wales, the mortality under five is 175 per 1000 born, while in the Liverpool district, representing the most unfavorable sanitary conditions, it is 460 per 1000. In the State of Vermont, which contains no large cities, the number of deaths under five, for the year 1883, was 23.8 per cent of the whole number of deaths; in the State of Massachusetts, in which there are several large cities, for the 12 years ending in 1884, it was 34 74 per cent, and in the city of New York alone, for the seven years ending in 1873, it was exactly 50 per cent of the entire mortality."

Resuscitation of the Drowned.—Dr. Clark, in advising young physicians, urges them in cases of death by drowning not to fail to use electricity in their efforts to resuscitate. He says that a fine point of differentiation as to the probability of resuscitation in a case of drowning is whether it was suicidal or accidental; for a suicide cannot be saved after five minutes of submergence, but the accidentally drowned may be submerged 20 and possibly 30 minutes, and yet be resuscitated. The horror and revulsion of feeling and the fear of death of the latter are not present in the former, and this influence on the mechanism of the heart may account for the difference. "Persevere in your efforts, as life has been restored in drowning cases after four hours' work."

Relation of the Left Hand to Health.—In connection with the subject of the duality of the brain, there is one point of great importance about which I can only say a few words. It is that we have a great many motor elements in our brain and our spinal cord, which we neglect absolutely to educate. Such is the case particularly with the elements which serve the movements of the left hand. Perhaps, however, fathers and mothers will be more ready to develop the natural powers of the left hand of their children, giving them thereby two powerful hands, if they accept that, as I believe, the health of the brain and spinal cord would improve if all their motor elements were fully exercised.—*Dr. Brown Sequard.*

Ingrowing Toe-Nails.—A correspondent of the *Scientific American* writes as follows: In a recent number of your valuable paper I noticed that an inquirer was advised for the cure of an ingrowing toe-nail to slit the center of the nail. I think a much better way is to thin the surface of the whole "top" of the nail with glass paper (sand paper), say No. 2, or finer, as best suits the case; keeping the nail short in the center, allow the corners to grow till they are a little beyond the flesh; place a little double of cotton cloth between the sore place and the edge of the nail. All this being done, the relief is immediate and the cure certain.

Doctors and Population — France has 38,000,000 population, 11,995 doctors, while it graduates 924 medical students in one year. Germany has 45,000,000 population, about 30,000 doctors, and graduates 925 students in one year. The United States has about 60,000,000 population, nearly 100,000 doctors, 13,091 medical students, and graduated 3740 students in one year.

The Writer's Cramp.—A stenographer says: "People often ask me when I sit down to do a long job of shorthand why I lay before me so many pencils of different sizes. My reason for it is that by picking up pencils of different sizes, and consequently weights, I am enabled to rest my hands while continuing to work. Each different pencil brings into active play different muscles, and I never suffer from cramps, as might be the case if I used but one size pencil. A horse going over an ordinary turnpike, up hill and down, will be in better condition at the end of a day than a horse which has traveled the same number of miles on a racetrack."

Electricity.

Electrical Progress.

There has been an enormous progress made in electrical industry within the last ten years. So rapidly and to such an extent has it already grown that the mere figures of its progress are utterly bewildering. There are now over $600,000,000 invested in electrical industries, and employment is thereby directly given to over 250,000 people, to say nothing of the indirect advantage which it extends to probably as many more. We have in the United States 1,000,000 miles of electric wire in operation; over 300,000 telephones; 400 miles of electric railroads; over 3,000,000 electric lamps, and the industry is now growing faster than ever before. At the same time the cost of electricity and all its appliances is constantly being reduced.

So profitable is the industry that the mechanical and inventive genius of the country is being centered more upon the business than upon electrical research. The fatalities which have occurred from imperfect appliances and from the inexperience of people in regard to its character, both as employes and as "outsiders," has no doubt had a tendency to check, somewhat, the progress of the industry; but still it goes on increasing in proportion and widening in application. And it will thus progress, and people must learn to keep out of its way; while all reasonable precaution should be taken by individuals and governing bodies to reduce the danger to its minimum.

Application of Electricity to Cross-Country Railroads.

Considerable discussion is going on just now over the problems connected with the application of electricity to locomotive service outside of city and town limits. It has already proven a success on street railways of from five to six miles extent; in several instances this distance has been increased to a service of 10 and even 15 miles, with a proportionately large number of cars moving at the same time.

Not only are electrical engineers considering the question of extending it to suburban railways generally, but the railroad journals of the country are freely discussing the question, which but a short time ago they regarded as purely chimerical. The outlook in this direction is growing more and more promising every day.

The New York *Evening Post*, in alluding to this more extended application of electricity, says: "One of the main objections to the electric locomotive seems to be its increased cost as compared with the steam locomotive. An electric machine at the rate of $20 per horse-power costs twice as much as a steam locomotive of equal capacity. This may be true, but it is to be borne in mind that these are still early days for the electric motor, and that the near future promises considerable reduction in the price of such apparatus, especially as it grows into a larger size. But this argument of cost is especially offset by the fact that the electric system promises, and so far has secured, superior economy in the reduction of running expenses for fuel and other purposes. In the case of the horse roads, for instance, the cost of animal-power is twice that of electric-power, since, in the case of electricity versus steam, the current would be generated by means of stationary engines of the most economical type as compared with locomotives, which 'eat as they go,' and naturally use fuel to a degree that leaves a large margin for daily saving.

"The other considerations in favor of the electric locomotive are that millions of dollars of property are annually destroyed by sparks from passing locomotives, and in a great many States the smoke and soot from the soft coal is very much of a nuisance. All this, of course, is absent from the electric locomotive, which, while not absolutely silent, gives no other additional sign of its presence and activity save an occasional harmless flashing at its points of contact. The motion with the electric locomotive is also extremely smooth and steady, and one can look out of the car windows without fear of being blinded and blackened with coal grit."

Electric Power.—The utilization and distribution of electric power are stated by Mr. F. L. Pope to have reached by far the greatest development in Switzerland and the United States. In the former country electricity is transmitted to considerable distances for large motors. At Solothurn a manufactory of machine screws is driven by an electric motor of 50-horse power, which derives its energy from a turbine-wheel more than five miles away. At Derendingen a mill of 36,000 spindles is driven by a pair of electric motors of 280-horse power, operated by a turbine-wheel 12 miles distant. It is predicted that in cities electric motors will soon practically supplant steam engines of less than 50-horse power.

Engineering Notes.

The Coming Street-Car.—What pattern of car shall we plan to build in the near future? This question has been asked us recently by car builders. Will the present style of electric and cable-cars continue to be used, or may we look for a radical change before long? There is no doubt that the development of the street railway business during the next few years is to be greater than has yet been thought possible, and the present style of car will continue to be used for a time at least, but there is a growing tendency to the use of long six or eight-wheel cars. We incline to the belief, however, that a change will occur, and the more general practice will be to operate mechanically propelled lines with short dummy-cars or locomotives, which will tow cars of ordinary build and operate in about the same space as now required for a team of horses. The advantages of such a practice are that the system is more elastic and can more readily provide for the fluctuation of traffic, and when the motor is in for repairs the passenger rolling-stock is not idle. Of course, such a system supposes that there will be better safety appliances than are now provided, either by vestibuling the platforms or providing such gates and guards as will compel the passengers to be careful. If the question was intended to call out our opinion as to the probability of providing a universal motive-power for street cars, we answer that the indications are that the field will continue to be occupied with a great variety of motors, but that there may be a very uniform pattern of tow-cars. These, however, will be more expensively constructed, for there is an increasing demand on the part of patrons for more ornamentation and greater comfort.—*Street Railway Journal.*

Notable Application of Power.—Some very interesting features are noted in the power equipment of the Treadwell mill, Alaska—the largest quartz-mill in the world, consisting of 240 stamps, 96 concentrators, 12 ore-crushers, etc., and requiring about 500-horse power. All of this machinery, covering several acres of ground, with its vast complication of counter-shafts and connections, is run by a single wheel seven feet in diameter, operating under a head of 490 feet, making 235 revolutions and using 630 cubic feet of water per minute, this being discharged through a nozzle 3 31 inches in diameter; with a 4-inch nozzle this wheel will work up to 735-horse power. Perfect regulation is afforded by the use of a deflecting nozzle operated by a hydraulic governor; the nozzle is about four feet long with a ball joint at the butt end, and to the discharge end is attached by lever connections an automatic hydraulic regulator, which varies the amount of water applied to the wheel as may be needed to adapt it to varying loads—a device which affords a peculiarly simple, sensitive and satisfactory regulation. With such an arrangement, and in such a location, the advantage of water-power is conspicuous. Thus the wheel above mentioned weighs but 800 pounds, and the entire equipment, embracing shafts, boxes, driving pulley, etc., only about 4000 pounds; on the other hand, a steam machinery plant, to give the maximum capacity of such a wheel, would not weigh less than 200 tons, and the expense of running such a plant would be almost immeasurably greater.

How Fast Can a Locomotive Run?—It seems to be quite clear that if steam enough could be supplied to a locomotive engine any speed could be attained, unless the resistance to its progress augmented in such a proportion that the boiler-pressure was not great enough to overcome it. The engine would then be, to use a marine phrase, "looked up." We know that at a velocity of as much as 72 miles an hour on a level a well-designed single-driver light engine will run with the throttle but little open, and apparently exerting very little power indeed. It is not easy to see why an addition of eight miles an hour should pile up the resistance as it is said to do. The question seems, however, to bristle with anomalies and contradictions of the most vexatious and puzzling character, and we are at times tempted to believe that these difficulties have no existence—in fact are for the most part the creation of fancy.—*Engineer.*

The English Channel.—The latest project for bridging the English channel has progressed as far as the formation of a company to obtain concessions in France and England, the drawing of plans and the making of soundings. The French Government will doubtless favor the enterprise, but whether a majority of the English statesmen can overcome their fear of invasion by France, even by the latest method proposed, is still a question. This project consists of a contrivance having a central point of tunnel termination at some distance from either shore and connected by a perpendicular shaft with a short section of bridge to be built out from the land. The great advantage of such a passage would be the difficulty of its successful use by the belligerent French in an attempt to capture Great Britain, as the bridge end could be destroyed.

The Proposed Submarine Tunnel between Staten Island and Long Island seems to be making good progress. A company has been incorporated and a route surveyed for the connecting road.

Passing Events.

San Francisco is getting ready for the celebration of the 40th Anniversary of the Admission of California into the Union. The streets and buildings are being decorated, and everywhere are signs of preparation for the coming holidays. It is expected that the procession will be the largest ever seen in this city, and that there will be a larger representation from the interior of the State than ever before.

The topic of interest in mining circles is the affair of the Mining Stock Association and the Hale and Norcross M. Co., in which an attempt will be made to bring to light the details connected with the milling of Comstock ores by the company.

The Labor Day parade, which occurred on Monday, was an orderly and well-conducted one which somewhat surprised the citizens by its magnitude. The labor organizations of the city made an excellent showing.

THE GAS WELL AT SUMMERLAND.—Mr. S. P. Snow writes us as follows from Santa Barbara: "The great wonder of California, the gas well at Summerland, still holds out to burn, and the supply of gas is, I believe, increasing. It is the hope of many that it will revolutionize the industrial situation of Santa Barbara. The wood-chopper say people are afraid to buy a load of wood for fear they will have a few sticks left when the gas lights and heats every house in the city."

Mining-Stock Mining.

A local daily newspaper, which pays considerable attention to the kind of mining (?) done on Pine street, in this city, says: "The operations of a few malcontents on the street threaten disaster to the welfare of dealers who have their capital, large and small, locked up in the Comstock mines. The disaffection is not contagious, and the pecuniary prospects of the few who may be engaged in the present warfare against the managers of the mines, who control the destinies of the market, is of little importance to the great majority of investors, who care more about a lively turn in a stock than they do for dividends."

This caring more about a lively turn in stock rather than for dividends is the very thing that has brought the mining-stock business into disrepute and reduced it to its present status in San Francisco. In former years there were 20 who bought mining stock to one who buys now; the value of the shares was far beyond the present prices, and the volume of transactions was a hundred-fold that of the present. San Francisco held first place of all cities in the matter of mining investment and San Francisco companies were looked upon as the best to take hold of a camp.

The past ten years have wrought a great change in all this. We have an unenviable reputation of speculating in stocks rather than working mines, and people who have mines to sell and open prefer Denver, Chicago, St. Louis, New York or Salt Lake men to take hold of them.

How much of this change is due to our preference for "a lively turn in the stock market rather than dividends," it is impossible to say, of course; but it is certain that the more we have neglected mines and fostered stocks, the less has been our influence in the mining industry.

The original idea of mining companies with shares of stock was to develop mines by the sales of stocks, the value of which varied with the value of the mine; but this idea has practically been lost sight of. It is notorious that the ups and downs in prices of stock are due more to the manipulations of the managers and brokers than to the conditions of the mine. By these machinations the order is reversed, and the better the mine, the more the price of the stock is forced down—for a time—and vice versa. It is notorious, too, that dozens and dozens of mines have been dealt in for years which never had the slightest chance to pay dividends.

As far as the mine itself is concerned, if it cannot be made to pay from its ore, it is made to pay from its stock; and those that pay certain people from the stock transactions seem to be the favorites with those who manage our stock markets for us. The moment some man attempts to put affairs on a proper basis there is indignation expressed by those interested about "disaster" to the welfare of those who have capital invested.

The truth is that it is not those who have capital invested who make money out of these stock mines. It is others who obtain the management and who take mighty good care that they pay very small shares of the assessments.

There is nothing new in all this, of course. The facts are perfectly well known and appreciated; but to all men who believe in the legitimate mining industry being fostered, it is very discouraging that such a state of affairs should last so long. Other States are making much more rapid strides in mining than California and Nevada; yet these other States pay much attention to mining and very little to stocks. There are very few California mines called on the Boards, and not one that amounts to anything as a real mine; and Nevada mines that could pay legitimately under other conditions are placed in positions where they are looked upon with suspicion, to the detriment of the whole industry.

If there is any possible way to remedy this existing condition of affairs and put the money from the mines into the pockets where it rightfully belongs; to place the mines on a more substantial basis as legitimate objects of investment; to change mere hourly speculations on paper into a business carried on for dividends, let us hope it will soon be tried.

ACADEMY OF SCIENCES.—At the last meeting of the academy, Dr. H. H. Behr read a paper on "The Caprification of the Fig," and F. J. Walker read one on "The Location and Area of the Big Tree Forests of California." A copy of this paper was ordered to be sent to the Secretary of the Interior. An obituary on the late Adley Hook Cummins was read by S. W. Holliday. One hundred and forty-six new books were reported, among them a very valuable set of 25 volumes of the "Zoological Record," donated by Prosper Huerne.

Mineral Lands and Railroads.

The Secretary of the Interior has decided the case of the Central Pacific Railroad against S. D. Valentine, involving the question of the exception of mineral lands from railroad grants. The particular tract involved is in the Sacramento (in this State) Land District. The Secretary holds that by the terms of the railroad grant all "mineral lands" are excepted from its operation, whether known to be general in character at the date when the railroad company's rights attached under the grant or not, if they are discovered to be mineral lands at any time before the issuance of the patent to the company, or certification where the patent is not required. He also holds the discovery of the mineral character of the lands after the company's rights have attached to its granted lands proves such lands were mineral in character at the date when the company's rights attached, and were, therefore, within the terms of exception from the grant.

This is a most important decision for the mining industry of this State, and is in keeping with that recently made by the U. S. District Court in the case of Francoeur vs. Newhouse. With both the departments and the courts favoring the miner, it is not likely there will be any reversal.

The decision is a common-sense one, which is more than can be said of many of the rulings which are apt to be based rather on technicalities than abstract justice. The last sentence quoted above is a view of the subject which will be distasteful to the railroad companies that have Government grants, but is a proper view nevertheless. It was never the intention of the Government to give the railroads any mineral land, for that was reserved for the prospector and miner.

In this and other States we have seen people buying titles to mineral ground from the railroad companies, when by rights the companies never owned it. In Montana, the miners are "up in arms" on the subject and are making a strong fight for their rights. The recent decision and ruling will do much to help their cause and defeat the attempt of the railroad companies to take possession of a magnificent mineral domain.

The Labor Day Parade.

The celebration of Labor Day in this city was carried out in a manner that was rather a surprise to many citizens. There were some 7000 wage-workers marching in the parade, and the city has never seen a more orderly demonstration or one that created a more favorable impression. The men were quiet, well-behaved and well dressed, showing themselves to be in good circumstances. The observer of the parade was struck with the thought that there seemed to be perfect organization in the ranks, and that each separate organization was but part of a grand whole.

Those who had an idea that organized workingmen formed a sort of lawless band must have had this dispelled when seeing this orderly and intelligent-looking body of men. The thousands of people who lined the sidewalks and streets were in harmony with those in the procession, and everything passed off without anything to mar the effect of the occasion.

Although there have been several parades on Labor Days, this was virtually the first time that the organized artisans of San Francisco ever showed their full combined strength. Nearly all branches of labor were represented. There were no gay uniforms glittering with gilt and tinsel, but simply a body of earnest working-people marching through the streets of the city in which they earn their bread. Yet they made a very decided and favorable impression on those who saw them, and it is pretty certain that their demonstration dispelled certain prevalent erroneous ideas concerning them, both as individuals and as to their aims and objects.

Hanging Up Stamps.

Isaac K. Cleaver of Deadwood, Trinity county, this State, has just received through the MINING AND SCIENTIFIC PRESS Patent Agency a patent for a hanging-up attachment for stamp batteries, the attachment being of such a kind that it will tend to grip the stem tighter according to the effort due to the weight of the stamp itself and jarring of the operating stamps to work the stem loose. Moreover, the hung-up stamp stem can be turned to any convenient position in which to carry out the purpose for which it is hung up.

A fixed bracket is supported by the frame of the battery and encircles the stamp-stem, the stem playing freely up and down through it. Between the ends of the brackets are eye-bolts, and upon these are pivoted opposing cam-shaped gripping-jaws. These jaws have straight faces in their inoperative position and curved or cam-faces for their gripping position. The ends of the jaws project outward from the bracket-ends, and to them are connected the lower ends of lifting chains. These chains at their upper ends join or connect with a swivel-ring to which any suitable hoisting mechanism may be connected.

When the stamp is operating, the jaws lie straight and the stem plays up and down between their straight faces, but to hang up the stamp the swivel-ring is hoisted and through the lifting chains the jaws are so swung that their curved gripping faces come down against and bind on the stem on each side, and as long as the tension is kept on the chains the jaws grip and hold the stems. Being cams, by reason of their position and curved faces they tighten on the stem the harder as the latter tends to pass down between them. Therefore, no matter how great may be the jar of the operating stamps, the particular stamp hung up will not be loosened, but on the contrary will be tightened and by reason of the swivel-ring the hung-up stem may be turned to the most convenient position for working. The inventor is sure there can be no slipping of the stem in the use of this attachment.

THE ANTI-DEBRIS ASSOCIATION.—The regular annual meeting of the Anti-Debris Association of the Sacramento Valley took place last week in Yuba City, the president, Dr. C. E. Stone, being in the chair. The report of the president was read, reciting the history of the operation of the association during the past year, and recommending that as the counties of Yolo, Colusa and Sacramento will soon join Yuba and Sutter in their efforts to put an end to destructive mining, arrangements be made to give these counties a representation upon the Board of Directors of the association. The report of the manager, George Ohleyer, was then read, and also a statement of the present status of hydraulic litigation. The secretary was ordered to cast the ballot of the association for the present directors, as follows: B. F. Walton, T. B. Hull, G. W. Hutchins and P. C. Slattery. G. W. Carpenter was elected treasurer.

A CARSON river mill superintendent says that if the snowfall next winter is one-half the average of last, there will be enough accumulated in the mountains, with that left from last winter's fall, to keep all of the river-mills in full operation throughout next year, and he predicts that the bullion product of Comstock mines in 1891 will exceed that of 1887.

THE Union Iron Works promised the firemen and machinists $20 bonus each for every knot the Cruiser San Francisco made over 19 knots on her trial. She did not make one knot over the 19 required, but the men were paid for three-quarters of a knot, or $15 each.

RICHARD DAY ATKINS, the well-known mining capitalist, died at Nelson, B. C., last week. He moved to Montana 25 years ago, and later made a fortune in the diamond mines at Kimberley, South Africa. Mr. Atkins was in San Francisco a few weeks ago.

ONE HUNDRED non-union miners imported by the Dunsmuirs are expected from England next week to take the places of the strikers in the Wellington collieries.

THE earnings of the Comstock Tunnel Company from October, 1889, to July 1, 1890, according to an official statement, aggregated $220,911.

[COPYRIGHTED.]

San Bernardino County.

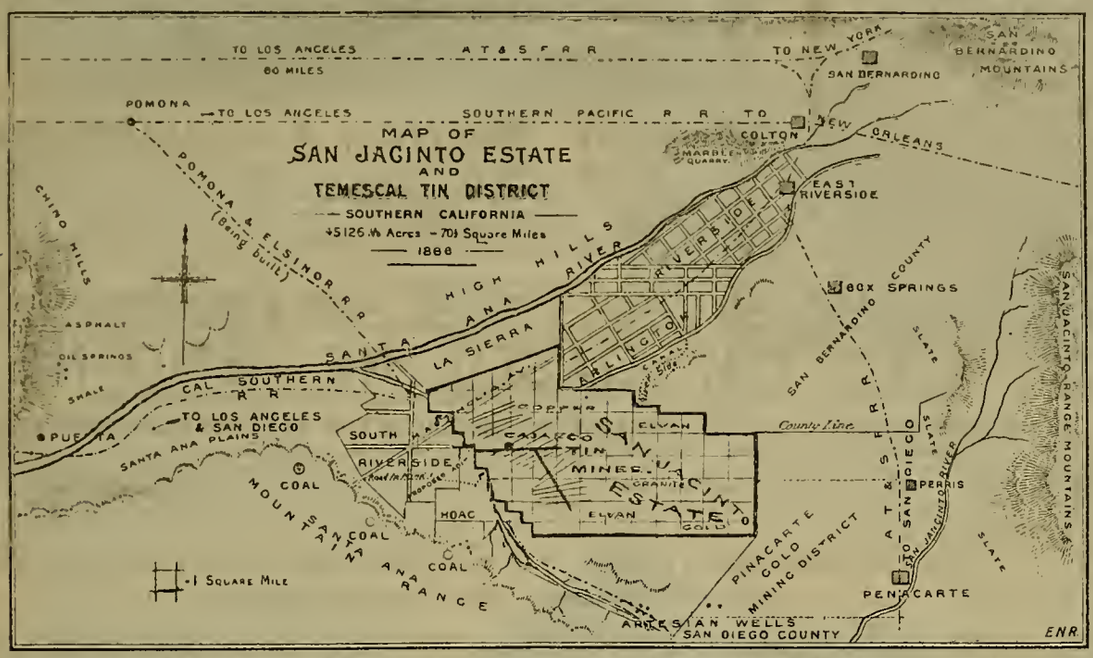
Its Mineral and Other Resources.

NUMBER IX.

[Written for the PRESS by JAMES H. CROSSMAN.]

Temescal Tin District.

On entering this county from San Francisco via Los Angeles, the first mining district that is called to the writer's attention is that of the Temescal tin district. It is situated on the southwest portion of the Rancho Sobrante de San Jacinto, a Mexican grant. The San Jacinto estate now comprises an area of 45,126 acres, or 70½ square miles. The tin district proper has a superficial measurement of 23 square miles, or 11 miles in length S. E. and N. W. by two miles in width. It is situated 55 miles easterly from Los Angeles.



MAP OF SAN JACINTO ESTATE AND TEMESCAL TIN DISTRICT, SAN BERNARDINO COUNTY.

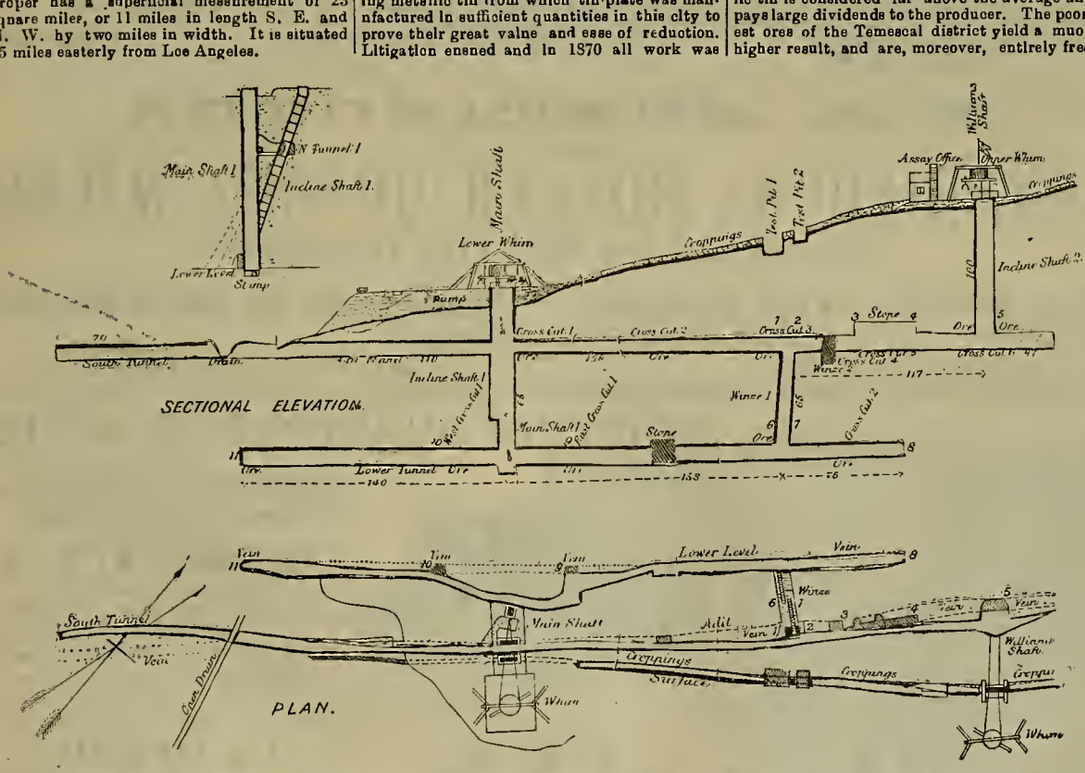
The district contains numerous metalliferous veins carrying ores of tin, copper, gold and silver in paying quantities. Tin being the predominating metal, I will first describe the formation and occurrence of its ores.

San Bernardino county is the only known locality on the Pacific Coast that contains ores in place of this valuable metal. Its domain is in the Temescal range of mountains and its zone proper is bounded on the north by the Santa Ana river and valley; on the south by Temescal creek, which separates it from the Santa Ana range; westerly by the Santa Ana plains and easterly by the San Jacinto river. This includes an area of 12 miles in length S. E. to N. W. and four miles in width, in which occur over 60 known and well-defined veins of tin-stone. These vary in width from four to six feet, and some of them carry ores of a high grade in the form of tin oxides (cassiterite). These veins, in the aggregate, extend on their line of strike 35 miles. The ores of these mines are remarkably free from any base that prevents their easy reduction and concentration or that debases the metallic product. The average yield is 15 per cent of black metal, which will return over 66⅔ per cent of pig tin from the furnace. The principal, and in fact the only well-developed mine in the district at present, is the

Cajalco Mine.

This was first exploited in 1868. Its ores for a test were reduced on a small scale, yielding metallic tin from which tin-plate was manufactured in sufficient quantities in this city to prove their great value and ease of reduction. Litigation ensued and in 1870 all work was suspended, which state of affairs continued until March, 1888, when the title was confirmed on an appeal, the Supreme Court of the United States settling for all time the validity of the title in the present company. During this lapse of time the public had forgotten the existence of this valuable deposit and ceased to wonder why it was not being worked, and at date very few realize that we have in our State a "treasure trove" that will soon fill a much-needed want. Last year our importations from England amounted to over 430,000 tons of tin-plate, equaling over 5,500,000 boxes of tin and terne plate, upon which a duty in excess of $5,500,000 was collected by the United States, to say nothing of the first cost of the material. The Pacific Coast alone consumes 30,000 tons per year in canning industries. The imports of pig tin into the United States last year were 20,000 tons.

There can be no question but that the mines of Temescal district can, when in active operation, supply the demand and support an army of operatives. Tin will be produced and extensive tin-plate manufactories will soon probably be erected at some central point accessible to trade centers. The extraordinary high grade of the ores of the Temescal veins, compared with tin ores that have for so many hundred years been worked profitably in Cornwall, renders it an assured fact that work of development will soon be profitably inaugurated. In Cornwall, ore that only yields 2½ per cent metallic tin is considered far above the average and pays large dividends to the producer. The poorest ores of the Temescal district yield a much higher result, and are, moreover, entirely free from the bases that deteriorate the Cornish ores. I confidently predict that the day is not far distant when San Bernardino will be to the United States what Cornwall is to Great Britain.



PLAN AND SECTION OF THE CAJALCO MINE, TEMESCAL TIN DISTRICT, SAN JACINTO ESTATE, CALIFORNIA.

The axis of the mountain range that lies east of Temescal creek, in which the tin-bearing zone occurs, is a secondary granite. It rises to an elevation of from 500 to 700 feet above the bed of the creek and 1280 feet above the level of the sea. Its granitic central core (which is four miles in width) is flanked on either side by belts of a hard dark-colored porphyry about 1¼ miles wide, which changes in both texture and color as it approaches the metal-bearing (granite) material. The colors vary from gray to white, and when in near proximity to the granite, assume a rose-red tinge. This discoloration is probably owing to iron or some other metallic oxide. This rock is technically designated by the Cornish tin miners as an elvan course, composed of quartziferous porphyry, which invariably skirts and accompanies the peculiar granitic formation that incloses the tin-bearing lodes. The granite of this district is identically the same, both in crystallization and mineral contents, as that in which the tin mines of Cornwall occur. The belt on its southeasterly course intersects the coal, asphaltum and oil bearing slates and shales of the Santa Ana range, and disappears—a notable feature.

The tin-bearing lodes are strictly confined to this granitoid rock, while the adjoining elvan courses and porphyritic rocks are seamed and fissured with veins carrying metals of copper, gold and silver, with occasionally a small percentage of tin. In this mineral zone are found more than 60 tin-bearing veins lying parallel with each other, coursing at nearly a right angle with the strike of the granitic belt. These veins in the aggregate represent an extended length of tin-bearing lodes of not less than 35 miles, coursing northeast and southwest, while the trend of the granitic and porphyritic belt is southeast and northwest, proving beyond controversy their character as *true fissure* veins, which in all probability go to the deep. They dip northwesterly at an angle of 65 degrees from the plane of the horizon.

The Tin-Bearing Lodes Proper

Of this district are known as the northwest group. The southeast group is situated 1300 feet distant, but carries an entirely different class of ore—gold, silver and copper predominating. Taking the principal tin mine, the Cajalco, as a central point, 700 feet northwesterly from the main shaft, a well-defined vein of tin ore occurs; 75 feet southeasterly a strong line of croppings show a promising vein of 325 feet in the same direction and the tin-bearing vein occurs, showing a long line of croppings which give high assays. Also in the same course three parallel veins are encountered, and at a distance of 600 feet the Little Scotty is seen with an incline shaft 15 feet deep sunk on a rich body of tin ore.

Samples of this ore show 20 per cent black tin. Six hundred feet southeasterly from the last-named vein, heavy croppings occur, which have been opened by a 10-foot shaft, the ore containing both copper and tin. The color of the latter changed from a brownish-red to a light-gray and bright rose color. The district extends about 1½ miles southeasterly from the last-named mine. In this distance 17 well-defined veins occur carrying tin-bearing ore. The principal development in this district has been on the Cajalco, one of the mines of the northwest group. Its course is north, 30 east, magnetic, with a dip of 74 degrees northwesterly. The vein crops boldly, showing an average width of 30 feet, and is traceable for a long distance. Lying parallel and within a distance of 300 feet, heavy croppings of other veins come to the surface.

Developments.

At a point in a ravine 140 feet below the summit an adit-level has been driven northeasterly 432 feet, from which surface connections have been made by two shafts, and winzes sunk to a lower level. The workings show a width of six feet, with a rich chute of tin ore 200 feet long, leaving an eight-foot vein of rich ore in the bottom of the mine. No crosscuts have been driven. The total work of development in the aggregate equals 1186 feet of shafts, tunnels, drifts and winzes. For particulars of developments, reference is made to the accompanying plan and section. In the plan and section, the numbers 1 to 11 are points of photographic views of lode taken by flash light, showing width and character of vein.

Silver, Gold and Copper.

About one mile from Temescal Creek and 3000 feet northwesterly from the Cajalco mine a group of silver and gold bearing veins occurs. One of these claims shows a width of eight feet. On this vein the work of development has been confined to a few open cuts. From the ore exposed a number of samples were taken. As an average, the following assay results were obtained: Silver, 165 ounces per ton; gold, $7.50; copper, 15 per cent.

Gold Mines.

The Gabilan mine is situated in the southeastern portion of the San Jacinto estate and seven miles from the Cajalco mine. Its strike is northerly and southerly; dip 70 degrees easterly; formation, porphyritic granite; gangue, quartz; strength of vein from two to four feet, two feet of which has paid by mill process $50 per ton. Some $250,000 had been extracted when litigation ensued and work was suspended. This mine has been developed by an incline shaft 400 feet deep, with levels run north and south for a distance of 350 feet. The concentrates assay from $200 to $7000 per ton. Work on the mine will be resumed at an early date.

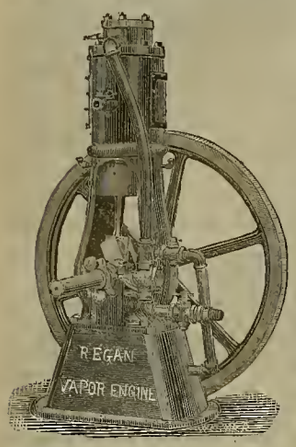
Fireclay.

The district also contains a superior article of fireclay in great abundance, which is suitable for terra cotta and porcelain.

Pottery works have been established on an extensive scale, and are in full operation at South Riverside. Work is confined, however,

(*Continued on page 162.*)

REGAN VAPOR ENGINE.



NO BOILER! NO FIRE! NO STEAM!
Simple, Compact and Cheap.
No Fire or Flame. Started Instantly without Even a Match.
No Ashes! No Explosion! No Engineer!
FULL POWER OBTAINED IMMEDIATELY.
The Moment Engine Ceases to Run, all Expense Stops.
NO DANGER.
Horizontal, Upright and Marine Vapor Engines and Launches.
Three-fourths to Fifteen Horsepower.
From $175 to $1200.

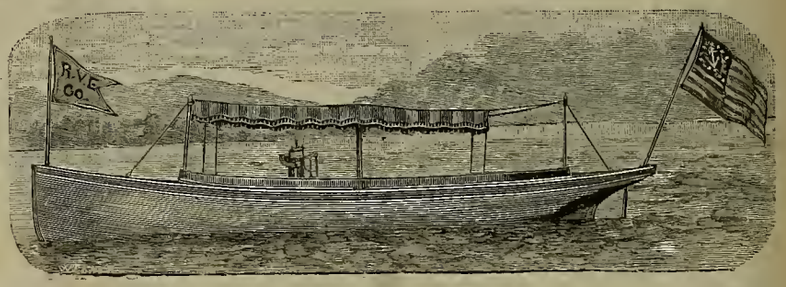
GEORGE HAAS, 824 Market St., Phelan Building, }
SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do a my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the V. por Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, coconnut grater, etc.

Yours truly, GEO. HAAS.



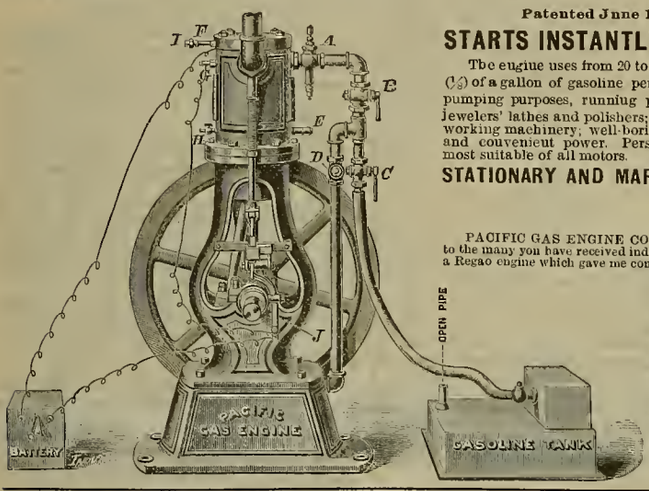
Regan Vapor Launches

The uses for small steamboats and launches are innumerable; tbsy are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many bave been deterred from purchasing such boats, because of the trouble and inconveuience of using coal, and the necessity of obtaining a Covernment license, engineer, etc. Our motor does away with these objections. The small spacs taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takss only **two minntes to get under headway**, and can be stopped when running at full speed within the length of the boat, ths reverse motion being instantaneous and effective. We carry in stock six regular sizes of bulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

REGAN VAPOR ENGINE CO., 221-223 First St., San Francisco, Cal.

THE PACIFIC GAS OR GASOLINE ENGINE.

Patented June 17, 1890—Nos. 430,504, 430,505, 430,506. Also in Great Britain and other foreign countries.



STARTS INSTANTLY WITHOUT THE NECESSITY OF BOILER, FIRE OR EXPERIENCED ENGINEER.

The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth (⅛) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED, and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY AND MARINE ENGINES FROM 3-4 TO 15-HORSE POWER. OVER 100 IN ACTUAL OPERATION.

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890.

PACIFIC GAS ENGINE CO.—GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, mine was a Regao engine which gave me considerable trouble. I had to remove the head and raise the tappet valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliances, bead, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head from any cause since you made the change (over two months). It gives me no trouble, my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective and cheap.

Respectfully yours,
B. S. HILL.
Cor. Encinal Ave. and Morton St.

U. S. MARINE HOSPITAL SERVICE, DISTRICT OF THE PACIFIC. }
SURGEON'S OFFICE, PORT OF SAN FRANCISCO, Feb 1st, 1890. }

TO THE PACIFIC GAS ENGINE CO.—GENTLEMEN: In answer to your letter of inquiry, of the 23d ultimo, relative to the working of the two-horse power vapor gas engine, recently set up by you at the U. S. Marine Hospital, Mountain Lake, near the City of San Francisco, Cal., I have to say that, up to date, the engine has given entire satisfaction, developing the power required in the specifications: of "raising 20,000 to 30,000 gallons of water 100 feet high through 600 feet of two-inch iron pipe, to tanks on the hill, in 24 hours." It is more economical than steam, requires less attention, and can be set in operation at a moment's notice.

If it continues to do its work as satisfactory as it has done since December 22 1889, when placed in operation, it may be pronounced a perfect success.

Very respectfully, PRESTON H. BAILHACHE,
Surgeon U. S. Marine Hospital Service, Custodian.

THE "VULCAN"
ICE & REFRIGERATING MACHINERY
—FOR—
BREWERIES,
PACKING HOUSES,
HOTELS,
COLD STORAGE,
FRUIT STORAGE,
CREAMERIES.

ENTERPRISE BREWERY, San Francisco.

The 25-ton Refrigerating Machine has been running continuously since 1887 and has proved economical and satisfactory in every respect.

HOTEL RAFAEL, San Rafael.

The "Vulcan" Ice and Refrigerating Plant is satisfactory in every respect, * * * a model of good workmanship. The ice is clear.

CHAPMAN AMMONIA VALVES.
ANHYDROUS AMMONIA

Patent Models
And Experimental Machinery of All Kinds
Shafting, Pulleys and Boxes,
Engines and Boilers.
DRAWINGS, PLANS and SPECIFICATIONS made for new machinery.
Jobbing of every description promptly attended to.
FINE WORKMANSHIP GUARANTEED.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

—MANUFACTURERS OF—
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C.² BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

Mining Engineers and Metallurgists

GREAT REDUCTION!
BATTERY SCREENS.
Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL
For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut or hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
221 & 223 First St., San Francisco, Cal.

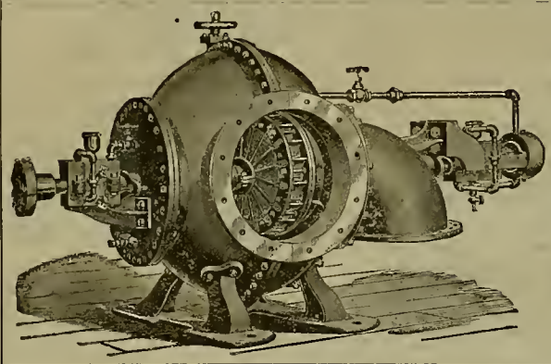
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

And Upward.
Rooms with or without Board.
Free Coach to the House.
T. POOLEY

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the famous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water Price, $5, post-paid For sale by DEWEY & Co., Publishers, 290 Market St., San Francisco.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 4, 1890.

General trade shows a steady increase; a large business is looked for the coming week, owing to an influx of buyers to take part in the Admission-Day celebration.

The local money market is gradually growing in ease under freer remittances from the country and more confidence felt by capitalists in the future.

MEXICAN DOLLARS—The market has held strong throughout the week at 92@92½ cts.

SILVER—The local market has been quoted by the Mint at $1.18¾, while local speculators bought at $1.19, with, at times, paying a slight advance. The bulk of that held here has been placed. By comparing the prices given below with the daily quotations furnished to the New York press, as given under our Eastern Markets by telegraph, it will be seen that the Department at Washington pays quite an advance for direct offers. On Aug. 29th the offers of silver to the Government amounted to 1,353,000 ounces. The amount purchased was 100,000 ounces at $1.1949 and 158,000 ounces at $1.1975. The majority of the offers were at very high prices. On Sept. 1st the amount of silver offered to the Treasury Department was 1,215,500 ounces, and the acceptances were 15,500 ounces at $1.19¼, and 135,000 ounces at $1.19½, or 150,500 ounces in all. The total amount purchased since Aug. 13th, the date when the present law went into effect, is 3,504,000 ounces, leaving but 996,000 ounces to be purchased between now and the 13th inst. On Sept. 3d the offers of silver to the Treasury Department amounted to 2,003,500 ounces. The amount purchased was as follows: One hundred thousand ounces at $1.19¼; 200,000 ounces at $1.19½.

QUICKSILVER—Receipts the past week aggregate 197 flasks. The market remains steady at unchanged quotations.

ANTIMONY—The market is weaker at the East and also in this city. A shipment of 8735 pounds was made the past week to New York.

BORAX—Receipts the past week aggregate 941 centals. The Pacific Borax Co. will ship by the J. B. Thomas 2000 ctls. to New York. The market is steady at current quotations.

LIME—Receipts the past week aggregate 2628 bbls. This shows quite a falling off. The near approach of winter is an unfavorable influence on the market.

TIN—Imports the past week aggregate 2461 ingots from Australia and 8468 boxes from Liverpool. The market locally is easy, but for shipment plate is strong, with no concession obtainable. The advance in silver is in favor of holders.

IRON—Imports the past week aggregate 100 tons from Oregon. The market is firm, with a more general consumption reported. Some shipments are being made up north. Both English and Eastern advices are favorable to higher prices, for the demand is reported active, with many furnaces sold well ahead.

COPPER—The market is strong. Mail advices from the East report sales for future delivery at over 17c for Lake. The consumption in America and also in Europe is large, being slightly in excess of the output of the mines.

COAL.—Imports the past week aggregated as follows: Sydney, 1945; Coos bay, 1150; Hiogo, 1850; Tacoma. 4296; Overland, 20. Total, 9261 tons. Carbon Hill is again in market. A fine sample from Alma, Wyoming, is on the market. The market is very strong at the recent advance. The buying for household purposes has been quite free; many are laying in their winter supplies. Some larger dealers look for still higher prices for Australian, while others again think that there will not be another advance soon. Ships are being loaded in Australia, while free shipments are being made from England. The Puget Sound collieries are increasing their output.

Eastern Metal Markets.

By Telegraph.

NEW YORK, September 3.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	54½	1 18¾	$16 75	$4 72½	$22 10
Friday	54½	1 19	16 80	4 72½	22 10

(Concluded from page 159.)

at present to the manufacture of pipe, tiles and firebrick, which are said to be equal to the imported article.

Stone and Coal

For macadamizing purposes, a hard, dark-colored porphyry, about three miles northwesterly from the Cajalco mine on the San Jacinto estate. A quarry has been opened, and the product is being extensively utilized for paving purposes, particularly in Los Angeles. A short distance below the quarry, reduction works have been erected and are in operation for breaking the rock to a proper size for street purposes.

A coal measure of unknown extent for value is being exploited in this section. Limestone also occurs.

Water Supply.

Water, that important factor for the successful working of metalliferous ores, particularly ores of tin that require concentration, is supplied in efficient quantities for all practical purposes in Temescal Creek, which runs along and upon the western portion of the ranch. In the driest season at least 400 miners' inches flow in the creek, with large reserves percolating through the sandy and gravelly formation of its bed. A submerged dam from the bedrock up would much more than quadruple the flow. This, if raised to a hight of from 15 to 20 feet above the surface, would create an artificial lake, from which a very large and permanent supply of water could be secured not only for an extensive water-power, but for irrigation purposes for large areas of agricultural land equal to any in Riverside, which is in the vicinity, and where water for irrigation can be procured, the land sells for high prices.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC BORAX, SALT and Soda Company, San Francisco, August 30, 1890. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 35) of One Dollar ($1.00) per share was declared, payable WEDNESDAY, September 3, 1890, at the office of the Company, No. 230 Montgomery Street, Rooms 11 and 12. Transfer Books close September 5, 1890, at 3 o'clock P. M.

F. B. PRITCHARD, Secretary pro tem.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Assessment Notices.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of August, 1890, an assessment, No. 19, of six (6) cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of September, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of October, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office, Room 11, No. 303 California Street, San Francisco, California.

DELINQUENT NOTICE.

GOVER MINING COMPANY—LOCATION of principal place of business, City and County of San Francisco, California; location of works, near Drytown, Amador county, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 14th day of July, 1890, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Wheeler, W A	53	1,100	275 00
Pratt, Freeman	95	50	12 50
Small, John C	96	1 066	266 50
Trefethen, George	99	500	125 00
Sanhorin, Helen P	101	250	62 50
Dyer, S C	102	200	50 00
Parsons, C A	103	200	50 00
Stone, N I	142	3,000	750 00
" "	155	2,000	500 00

And in accordance with law, and an order of the Board of Directors, made on the 14th day of July, 1890, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California, on SATURDAY, the Sixth day of September, 1890, at the hour of one o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

GRAY DEW, Secretary.

Office, 13 and 15 Fremont street, San Francisco, California.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest person at brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 400 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **DR. WILLIS E. EVERETTE,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

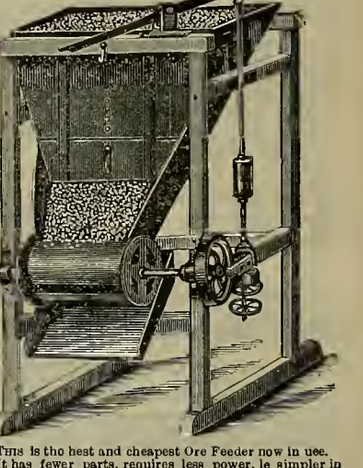
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

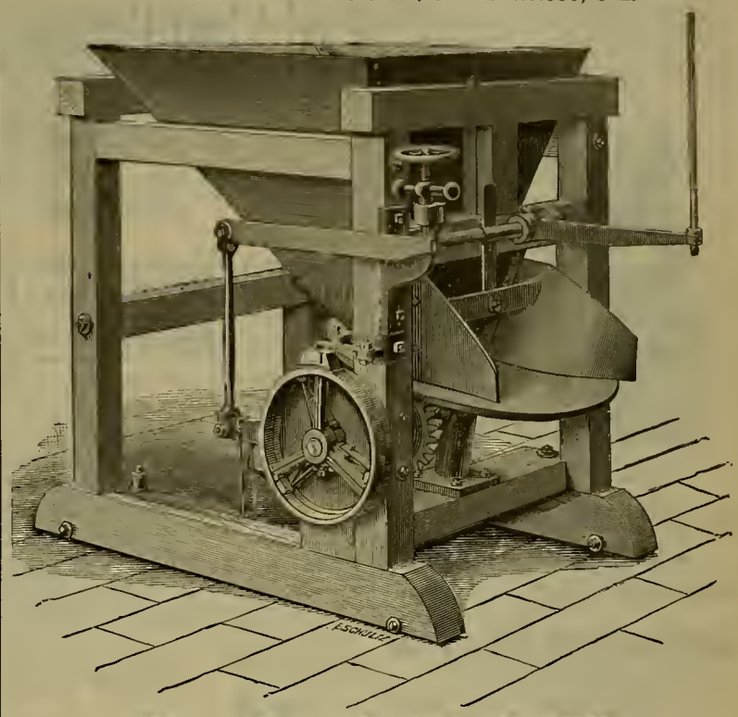
JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

'CHALLENGE," STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS; PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

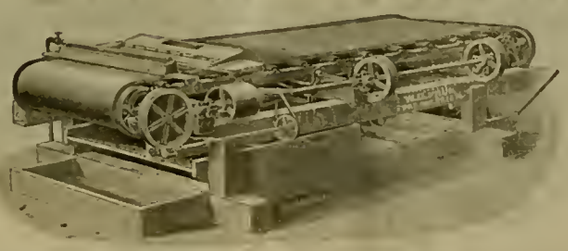
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

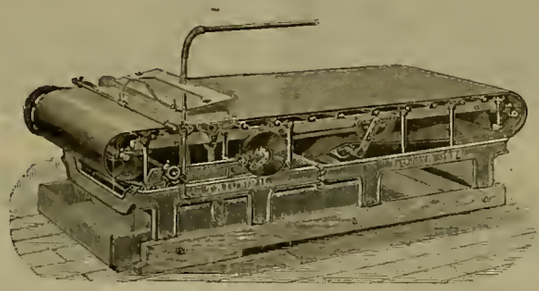
ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

TRANSPORTATION OF ORE BY HALLIDIE'S PATENT WIRE ROPEWAY.

HALLIDIE'S
PATENT WIRE ROPEWAY,
For the Economical and Rapid Transportation of Ore and other material.

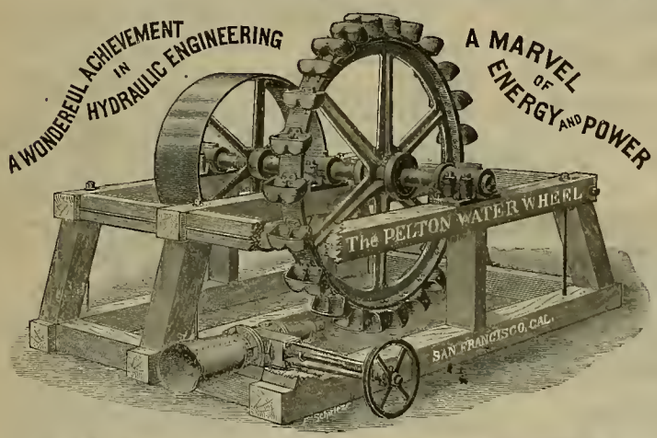
Erected by Us During the Past Fourteen Years in Spans of
200 TO 2,000 FEET.

Simple, Economical and Durable.

HAVE BEEN THOROUGHLY TESTED
In all Parts of the Country.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.



A WONDERFUL ACHIEVEMENT IN HYDRAULIC ENGINEERING
A MARVEL OF ENERGY AND POWER
The PELTON WATER WHEEL
SAN FRANCISCO, CAL.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.
121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

THE GATES

ORE AND ROCK CRUSHER
—IS—
THE MOST IMPORTANT IMPROVEMENT
That Has Ever Been Made in This Class of Machinery.

IT WILL DO MUCH FINER WORK
Than Any Other,
AND AT ONE-HALF THE COST IN WEAR.

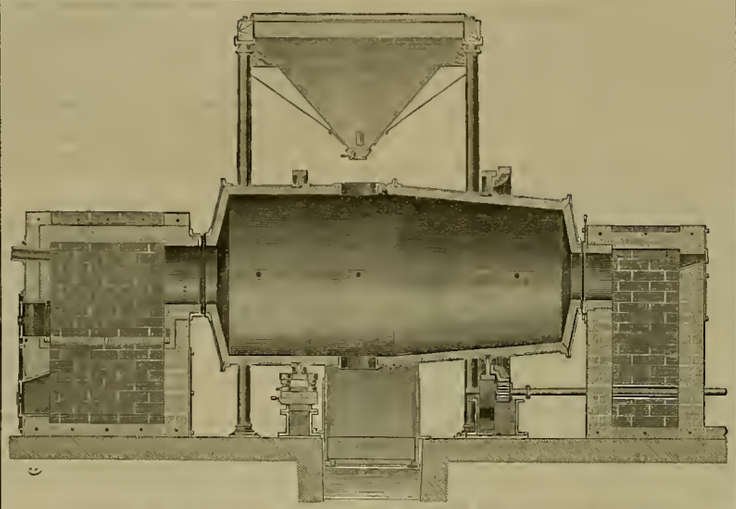
The Air Brush.

The application of the principle of the air brush to a tool for distributing liquid pigments upon paper or other surfaces, in the production of pictures, is a novelty in the arts, and though known but a few years has come into practical use in many departments. Of course, the instrument cannot make up for any deficiency of artistic skill in the operator, but it facilitates work and shortens the time consumed in the execution.

This artists' tool is, in brief, a device for applying liquid color by a jet of air. It consists of three parts—air pump, air reservoir and hand-piece, connected by the necessary rubber tubing. The action of the hand-piece is entirely controlled by the thumb-valve, and the artist can produce the finest line or instantly change to a broad shadow. These effects, with a single stroke, have a result that only hours of toil can equal by other means.

The engravings shown herewith will give a clearer idea of the action of the brush. It will be seen that holding the instrument low produces fine lines, that by elevating the instrument broad effects are produced, and that the artist can go from line to shadow without stopping, as seen in the cut. Supposing the instrument moved from *A* to *B*, following dotted lines, the effect would be as seen on the paper from *A* to *C*. The increased supply of liquid necessary to produce the broad effect at *C*, is regulated entirely by the thumb.

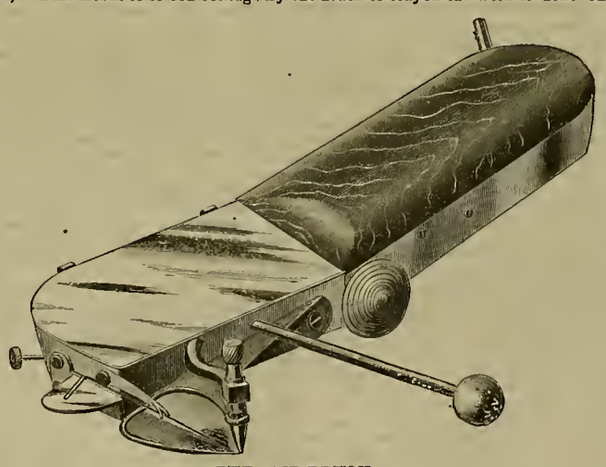


ARENTS' IMPROVED BRUCKNER ORE-ROASTING FURNACE.

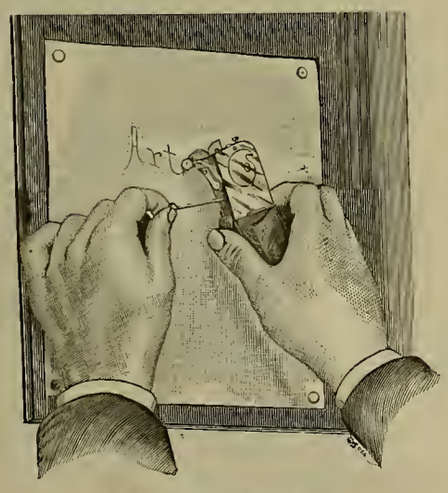
It will be understood that the mechanical contrivance is barely such as will furnish the constant, uniform current of air for carrying the liquid color, and the means of so controlling this current that it is in perfect sympathy with the slightest pressure of the thumb, the least movement of the wrist or hand on the part of the artist. The color is thrown on the paper with the rapidity of the jet of compressed air. By the brush or crayon the work is done only so fast as the hand or fingers move. It is specially used in working with India ink and water-colors, and in applying lithographers' ink to the stone. Any color or combination of colors can, of course, be used, as any dilute liquid pigment can be applied by it. It will work on any ordinary surface of paper, canvas, glass, bromide paper, etc. The effects of soft crayon and pastel are exactly reproduced by it, and the work is indelible. In draughting or designing, where much detail is desirable, the rapidity of the work permits of elaboration otherwise impossible in commercial work.

Fine lines are made by holding the instrument close to the paper, with the thumb-lever pushed forward. Broader lines are made by holding the instrument slightly higher, with the lever slightly back, to cause a larger flow of color. To produce shadows, the instrument is elevated according to the breadth of work desired, and a correspondingly large flow of color is of course obtained by pulling the thumb-lever back toward the hand. The engravings show the detail of the air brush itself, with the thumb-lever, etc.; the brush used in making a fine line; in making a broad shading; and also an operator at work with the air-receiver beside him. These implements are made by the Air-Brush Manufacturing Co. of Rockford, Ill.

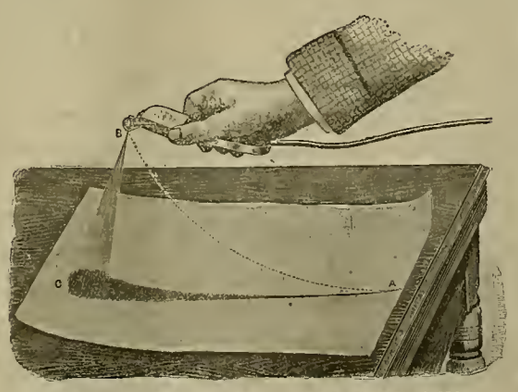
ARTIST AT WORK WITH AIR-BRUSH.



THE AIR-BRUSH.



MAKING A FINE LINE.



FROM A FINE LINE TO BROAD SHADING.

An Ore-Roasting Furnace.

The accompanying cut shows the Arents' improved Bruckner roasting furnace for ores, which, as generally made, roasts in charges of five tons each, three of which may ordinarily be finished in 24 hours. Like the Bruckner, it revolves horizontally about its axis and has a fireplace on one end of the roasting chamber with the flue at the other.

Its difference from and advantage over the Bruckner consists in the roasting chamber not being a true cylinder, but being made in the shape of a frustum of a cone, its base being turned toward the fireplace. In this frustum of a cone, the ore seeks the same horizontal level when revolved around its axis as in the Bruckner, and is thus forced to form a layer of graduating thickness in the chamber, with its thin end near the flue end and its thickest or deepest end toward the firepface. The flame coming from the fireplace is, of course, hottest at that end; and there, in this furnace, it finds the most ore to heat.

As the flame in its passage through the roasting chamber loses in intensity, so the ore layer becomes thinner; and there is less and less ore to heat until the flue is reached. In this manner the charge is "done" simultaneously at all points throughout the roasting chamber, which, as is well known, is not the case in the Bruckner, with its overlayer of even thickness acted upon by a flame of graduating power. The operator of the Bruckner is apt to either "overdo" the charge near the fireplace, or leave it "underdone" near the flue, entailing a greater loss in metal, in fumes or in tailings, respectively, than is necessary.

This bad feature of the Bruckner is entirely avoided in the Arents furnace, with its conical roasting chamber, as above described; and therein consists its advantage over the former, while retaining all its good features. Four of these furnaces were made by the Fulton Iron Works of this city for the Mt. Cory mine, Nevada, where they have given excellent results.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mining Affairs at West Point.

EDITORS PRESS:—I left San Francisco on the 20th of August and arrived at West Point, Calaveras Co., on the 22d, over a route new to me. I have lived in this city nearly 40 years, and have not had a great desire for traveling in the mountains. I had been troubled with neuralgia off and on for many years, and I was advised to take a trip to the mountains and "sweat" it out of me, which I think I have succeeded in doing. The fare from here to Valley Springs by rail is $4 55; then the stage to Mokelumne Hill, $1.50; then stage again to West Point, $2 50, and perhaps $2 50 on the road for meals. Arriving in the town, I stop at the new hotel, called the Mountain View, kept by a whole-souled old Californian named H. Beauchman. Everything is kept clean and neat; the rooms are clean and airy.

I went out about two miles from the town to see a friend of mine from San Francisco named C. W. Watkins, a very enterprising, stirring miner, with plenty of "get up and do" about him. I found him at a new mine that he has opened, or rather an old shaft that he sunk on. He has great faith in that camp. He went to work and made plans for machinery and hoisting works, and from the time he got the machinery on the road from here to West Point until he had it in operation hoisting, pumping water out of the mine and taking out good ore, was only about three weeks. The mine is called the Tucker, and it is about two miles southeast from West Point. He also at one time opened and operated the Blazing Star mine, the Water Lily, the Tom Paine and several other mines that are now taking out rich ores. If that camp had a few more such men as he is, it would be one of the best mining camps in the State of California.

I went all over West Point Mining District, and from information and what I have seen it seems that many of the failures in mining are due to the incompetency of men who went to West Point to make a fortune in mining without knowing much about it. Here, as in other camps, such men buy up a lot of machinery without knowing whether it will answer the purpose or not, and open the mine thinking they will strike a bonanza right off. They spend a few thousand dollars at guesswork, come to water in the mine (as in all mines with good ledges), their pumps are not good enough to keep the water out, expenses run up, men must be paid, no ore comes out of the mine, and it is shut down. After awhile the winter sets in and there is more water in the mine; the hoisting works get out of order, the horses go to rack, the machinery is useless in most cases, and they go to San Francisco and report the mines in West Point a failure and no good. Under such circumstances, the workingmen go to other camps to mine and give the camp a bad name, when in reality the cause is incompetency or lack of funds. There are numbers of such cases at West Point, which any man can see by going through the district. All men going to West Point to mine will find plenty of wood and water very low for mining. Lumber costs about $12 per thousand. In former days, say 25 or 30 years past, this was a rich camp, mostly peopled by Mexicans. They were good miners, but would not work in poor ground, as it would not pay them. They worked on the top of the ground and in many places sunk shafts from 20 to 100 feet, until they came to water. They would then quit work and go and sink another shaft, and repeat the same thing until the camp for miles around is nothing but mining holes. From all accounts, they got large amounts of rich ore from those shafts. They could not save any sulphurets, now considered the rich part of the ore. In some cases they would pack the ore for several miles on mule-back to have it crushed in some old arastra. If the rock did not pay them $50 to $300 or $400 to the ton they would not touch it, and would go elsewhere. Many of those old Mexican mining shafts are the rich mines that are now working. All that is wanted is some capital and a little energy and "get up and get" and some common sense to make a certain success at West Point.

Mining is like any other business and has to be attended to strictly by competent men, not by overseers sitting in barrooms playing cards and letting the mine take care of itself. In such cases you must and will meet failure.

After looking carefully into the causes of failure in mining in West Point, I am thoroughly satisfied from what I heard from others and saw for myself that mismanagement and want of funds form the real cause of dullness in this camp. There ought to be 20 mills working in that district at this time. In the southeast part of the district on the Mokelumne river is a different formation. About 4 or 5 miles from the town on the Stockings Fork, the ledges are very large, from 12 to 30 feet wide, though little work has been done there.

It is not very easy getting to it. Wood and water are free and plentiful. The ore is not, I think, as rich as the ore in the granite formation, and in this part of West Point it is in slate, which miners say will not give out as soon as those mines in granite.

Among those mines that are paying well is the Blazing Star. I saw an article in your paper yesterday stating that the men working in this mine had to lease it to get their pay. The ore shipped from there to the Selby works to be smelted is highly sulphureted and pays all the way from $50 to $500 and upward to the ton, but on the average it will pay $200. It costs at least $20 to $25 per ton to ship it here for working. The free milling ore is worked at the mine in a 3-stamp mill, which the miners say will pay or nearly pay the whole expense of running the works. If all that is true, which the men who take the ore out of the mine say they can prove, then by all means the miners should be paid their hard-earned wages without having to lease the mine.

But the miners say that in the last settlement they had with the managers they only received a fraction over 50 cents on the dollar for their hard work, many of them having families to support, and the storekeepers and hotel-keepers also suffer from this sort of management, which gives the camp a name it should not have. JAMES REILLY.

1827 Stockton St., San Francisco.

Calico Mining Items.

EDITORS PRESS:—The Waterloo Mining Co., Calico, San Bernardino county, is running their 60 stamp mill and their 15-stamp mill day and night, receiving 200 tons of ore per day from the Waterloo mine and 20 tons per day from the Silver King mine.

The Runover Mining Co. has 15 stamps at its mill kept running steadily on ore from the Occidental, Oriental No. 2, Silver Monument, Red Cloud and Mammoth mines.

The Barber Milling Co. start up on chloriders' ore shortly. A good run is expected, as chloriders have, as a rule, been doing well of late.

At the Young Waterman mine 40 tons of first-class ore are awaiting treatment.

From the Sue mine chloriders will ship 50 tons for treatment to Barber mill next week.

Pluth & Greer have about 100 tons of Champion ore ready for shipment, with prospects of a continuous body of ore. This is low-grade ore, but very easily mined.

John Sutton is taking out some very rich ore from the Golconda mine.

About 220 men are employed mining in this camp.

The Atwood mine, which has been idle for some time, has started up again under new management. L.

Silver.

London *Money* of recent date says: The Indian exchanges have moved steadily up with silver, and the Indian demand proves to have in no way decreased whenever a further rise in the metal seems impending. After awhile it is to be presumed that Indian trade will completely adapt itself to the new conditions. It is likely, too, that the Chinese demand will increase, and so possibly will that of Africa. So far as can be foreseen, then, a very considerable rise in the price of silver will not diminish the consumption. Of course it is possible that, on the other hand, it may largely increase the production. The production has been steadily increasing for many years, and it seems reasonable to conclude that a rise in price will further stimulate it. But it is to be borne in mind that of all industries mining is perhaps the most precarious. The gold production of the world was augmented enormously between 1850 and 1860, although gold was falling in value. During the past ten years it has been steadily decreasing, although the value of gold has been very greatly rising. Something of the same may happen in the case of silver. Some of the mines now believed to be very rich may suddenly give out, or all of them may prove to be less rich than they were supposed to be. Whether this will happen or not it is impossible to say. All that can be asserted with confidence is that the production does not depend on the value of the metal. We have in previous articles given our reasons for believing that sales by the Continental Governments will not be very large.

YIELD OF "WORKED OUT" MINES.—The Virginia *Enterprise* says that since James G. Fair's time as superintendent of the Cons. California and Virginia mine, when he thought it pretty well worked out, the mine has paid $3,466,800 in dividends, and probably $12,000,000 has been taken out. In the Hale and Norcross Superintendent Keating has taken out probably $5,000,000 and employed a large force of men extracting and working ore that Mr. Fair left, and there is plenty of it left yet. As Mr. Fair left plenty of ore in the Hale and Norcross and in the Con. Cal. and Virginia for Mr. Lyman and Mr. Keating to work at a profit, owing to improved methods and cheaper means of extraction and handling, so will Mr. Flood leave plenty for others to do likewise.

THE EFFECT OF GUM-CHEWING has been studied carefully by an expert. In gum-chewing the masseter muscles which move the jaw are abnormally developed, and the fatty substance which produces fair, plump cheeks is deteriorated.

[COPYRIGHT, 1890, by DEWEY & CO.]

San Bernardino County.

Its Mineral and Other Resources.

NUMBER X.

[Written for the PRESS by JAMES H. CROSSMAN.]

Mining Districts.

San Bernardino county contains within its borders a number of mining districts, some of which since their formation have been subdivided. The names and boundaries of the subdivisions are given as accurately as possible.

On entering the county via Los Angeles on the S. P. R. R., the first that is called to our notice is the Temescal tin district, situated in the southwesterly portion of the Rancho Sobrante de San Jacinto. This district comprises Tp. 3 south, R. 5 west, and Tps. 3 south, R. 4 west.

Black Hawk District.

The initial point of this district commences at Rabbit Springs, thence 12 miles easterly to Old Woman's Springs, thence southerly to the east side of Cottonwood canyon, along the divide of the mountains to a high point easterly from Nichols' furnace in Morongo district; thence westerly to Arastra Creek valley, passing the old Morongo mines to the summit of the range, dividing Bear valley from Arastra valley, thence westerly six miles along said summit to the headwaters of Crystal creek; thence northerly to place of beginning, including Tp. 2 and a portion of 3 N. R., and 2 and 3 east S. B. M.

Holcomb Valley

District is bounded on the northeast by the Black Hawk mining district and the valley regions; on the west by the Gold and Silver district; on the south by the northerly base of Old Grayback, comprising that area situated in Tp. 3, N. R. and 1 and 2 E.

Bear Valley.

District is located on the southwest corner of Tp. 3 N., R. 1 east, and on the southeast corner of Tp. N., R. 1 W.

Burroughs District

Commences on its southwest corner at the mouth of Burroughs canyon where the Mojave river empties into the desert; thence up the Mojave river to the southwesterly line of the Holcomb Valley district; thence northerly to the desert; thence along and skirting the base of the mountain, following the outlines of the desert to the place of beginning, and, as will be seen by reference to the map published in the PRESS, includes the Gold and Silver district.

Ruby District

Lies in the form of a triangle, the northwest corner being the northeast corner of the Black Hawk district; thence due south 12 miles; thence east 12 miles to Gus Knight's Wells; thence northwesterly to place of beginning.

The Gold and Silver Mining District

Is included within the boundaries of the Burroughs district. Its boundaries are as follows: On the south and west by Deer creek, on the north by the desert, and on the east by Holcomb valley. This district has been set off and segregated from the Burroughs district since its formation.

The Morongo District

Is bounded on the northwest by the Black Hawk's southeast boundary line; thence due south for six miles; thence east to the Mojave desert; thence N. W. to the southeast boundary of Ruby District; thence west to place of beginning.

Silver Mountain District

Commences at Stoddart Crossing on the Mojave river; thence southeasterly to Rabbit Springs; thence southwesterly to the Panamint Crossing on the Mojave river; thence due west to county line of San Bernardino and Los Angeles; thence to S. E. corner of Kern; thence to place of beginning.

Ord District

Commences at the eastern boundary of Silver Mountain District; thence easterly to S. E. corner of Dry Lake District, 27 miles; thence north 18 miles; thence east 6 miles; thence due north 10 miles; thence following the Mojave river southwesterly for 6 miles; thence southerly to Newberry Station and to place of beginning.

The Lava Bed Mining District comprises Tp. 7 N., R. 4 E. and Tp. 7 N., R. 5 E.

Calico District

Comprises Tp. 10 N., R. 1 E., the south half of Tp. 11 N., R. 1 E. and west half of Tp. 10 N., R. 2 E; commencing at a point 2½ miles west of the Waterloo Mill or Little Red Butte; thence 10 miles south; thence 10 miles to place of beginning.

Grapevine District

Is bounded on the west by Dry lake; on the east by Calico Mining District; south by the Mojave river; north by the Mojave and Death Valley wagon-road; commencing at S. W. corner of Tp. 10 N., R. 2 W., and running along the west boundary of Calico District to Paradise Springs in Paradise valley, 10 miles distant; thence west 12 miles; thence south 10 miles; thence east 12 miles to place of beginning.

Soda District

Commences at a point on the northerly end of Cronise lake; thence southeasterly to Mesquite Springs; thence northeasterly to Marl Springs; thence northwesterly to Hallaron Springs; thence west to the northeast corner of Five Point District; thence southwesterly to place of beginning, commencing at N. E. corner Sec. 3, Tp. 12 N., Range 6 E; thence northeasterly to N. W. corner Tp. 14 N., Range 8 E.; thence easterly 21 miles; thence southeasterly to N. E. corner Tp. 12 N., Range 12 E.; thence S. W. to N. E. corner Tp. 11 N., R. 7 E.; thence northwesterly to place of beginning.

Alvord District

Has its northwesterly boundary at Garlic Springs; thence southerly for 24 miles to the southwest corner of Calico District; thence easterly 12 miles; thence northwesterly 20 miles to Bitter Springs; thence west to place of beginning.

Five Point District

Is bounded on the south by the Alvord Mining District; on the east by Soda Mining District; remaining boundaries unknown.

Clark District

Comprises that region inclosed between the following boundary: Commencing at S. W. corner Tp. 16 N., R. 12 East; thence N. 3 townships (18 miles); thence east to State line boundary; thence along State line boundary to N. E. corner Tp. 17 N., R. 15 E; thence south 2 townships; thence west 4 townships to place of beginning.

New York District

Commences at S. W. corner Tp. 11 N., Range 15 E.; thence north 24 miles; thence east 18 miles; thence south 24 miles; thence west 18 miles to place of beginning.

Brier District

Comprises an area of 24 square miles, situated in Salt Wells valley, Tp. 4 and 5 N., Range 7 and 8 W., S. B. M.

Borax Lake

Mining district comprises an area of 24 square miles, and is situated due east from Brier district.

Exchequer District

Commences at S. E. corner Tp. 10 N., Range 19 E.; thence north 10 miles; thence west 12 miles; thence south 18 miles; thence east 12 miles to place of beginning.

Trojan District.

Situated in Providence mountain, comprises that section lying within the following boundaries: Commencing at the N. W. corner Sec. 34, Tp. 9 N., Range 13 E; thence northerly from the initial point 18 miles; thence east 12 miles; thence south 18 miles; thence west 12 miles to place of beginning. Since the formation of this district it has been subdivided, and that portion west of the divide is known as the Gold Belt. The southeast half of the district has received the name of the Arrow gold district. The northeastern still retains the name of Trojan.

Sacramento District.

The initial point of its boundary line is the southeast corner of Exchequer district; thence east 12 miles; thence south 12 miles; thence west 12 miles; thence north to the place of beginning. Since its formation the boundaries have been extended in an easterly direction to the Colorado river, which now forms its easterly boundary.

Scanlon District

Is a new and important mining district recently formed. It is situated in Old Woman's Mountain and has the following boundaries: Its initial point is Danby Station, on the line of the A. & P. R. R.; thence northeasterly to Bolin Mountain; thence southeasterly to Old Woman's Peak; thence southwesterly to Coyote Springs; thence northerly to place of beginning.

Twenty-nine Palms

Comprises Tps. 1, 2 and 3 North, Ranges 1 and 2 E.; Tp. 3 N., Ranges 1, 2, 3 and 4; Tp. 2 N., Rs. 1, 2, 3 and 4.

Colorado River.

West of the range of mountains bordering this river there are several mining districts whose names are unknown to the writer; they are reported to contain large veins of gold-bearing quartz, copper and lead, with some very promising veins of silver-bearing ores. Their accessibility to the Colorado river, a navigable stream for steamboats, gives these claims additional value.

(To be Continued.)

ASTRONOMICAL SOCIETY.—The next regular meeting of the Astronomical Society of the Pacific will be held in the library of the Lick Observatory on Saturday, Sept. 13th. This will be the last meeting of the year at the Lick Observatory. The following papers are announced: Prof. L. Weinek, "Drawings of the Moon;" Prof. Milton Updergraft, "Some Notes on Astronomy in South America;" A. Lenschner, "Corrections to Oppolger's Bahnbestimmung;" R. Schmidt, "A Suggestion of a Way to Forward Our Knowledge of the Asteroids;" A. O. Lenschner, "Elements of Comet Coggia (July 19th);" A. O. Leuschner, "Elements of Comet Denning (July 33d);" Prof. Daniel Kirkwood, "The Age of Periodic Comets;" E. E. Barnard, "The Photographs of the Milky Way, Taken at the Lick Observatory in 1889."

SHUT DOWN.—H. M. Wheeler from Sanborn reports the mill shut down. It has been demonstrated that the ore must be roasted to be profitably worked, and the company will doubtless build a furnace. The employes of the company were all paid off, and it is not probable that the mill will be started again until a roasting furnace is built.—*Silver State.*

Quicksilver in California.

Details of the Establishments at Work.

J. B. Randol, special agent in charge of the statistics of quicksilver for the 11th census, has completed his work, and a bulletin has been issued giving a brief summary of the more important facts obtained in the investigation. From this, we make the following abstract:

During the calendar year 1889 there were 26,464 flasks, or 2,024,496 pounds, or 1012 short tons of quicksilver produced in California. About 20 flasks (less than $1000 in value) were produced in Oregon. The product is notably less than the usual yield. In 1888, 33,250 flasks were produced.

There are in California 17 productive mines with 36 furnaces, and 3 non-productive mines with 4 furnaces. In Oregon, there is 1 non-productive mine with 3 furnaces.

The productive mines and active furnaces employ 937 operatives, of whom 416 are engaged in surface work and 521 underground. The other mines and furnaces employ 24 men, making a total of 961 employes.

Of 195,714 tons (2000 pounds each) of cinnabar ore mined, 92,964 tons were roasted, producing 26,464 flasks of quicksilver, each containing a standard quantity of 76½ pounds avoirdupois. Of the 11 establishments working ore, one reported only 200 tons produced and worked in retorts, with an average yield of 2.295 per cent, the highest percentage returned. The lowest average yield was 0.286 per cent, and the average percentage yield in quicksilver for all the ore roasted was 1.088. The largest quantities of ore produced and roasted were respectively 28,007 and 28,887 tons, and the quantity of quicksilver produced at the several works ranged from 120 up to 13,100 flasks.

At 11 active establishments there were expended $219 622 for supplies, $626,289 for wages and $35,490 for other expenses, embracing taxes, rent, interest, etc., making a total of $881,401, showing that 71 per cent was paid for wages, 25 per cent for supplies, and four per cent for all other expenses. Of the amount paid for wages, the office force absorbed $34,900, and there were paid to foremen, mechanics, miners, furnace hands and laborers, $591,323.

The cost per flask of quicksilver ranged from $65 74 to $21.66, the average cost for all being $33 21.

For the year the highest price was $50, and the lowest $40, giving an average of $45, which for the year's production, 26 464 flasks, would make a total valuation of $1,190 500 The difference between the cost, $881,401, and value, $1,190,500, is $309,099, which may be regarded as the profit on the year's work, based on the returns collected. The difference between average cost and average sale price was $11.69 per flask.

The one establishment producing quicksilver at a cost of $65.74 per flask met with a serious loss on its output, and no establishment made a profit commensurate with the risks attending the mining of cinnabar, its manufacture into quicksilver, and finding for it a market in competition with rich and important establishments carried on by foreign governments.

As to wages, foremen are reported to earn daily wages ranging from $10 33 to $2 66, mechanics, $3.60 to $2.05, laborers, $2 to $1.18, the last-named rate being for Chinamen. Boys under 16 years of age, of whom only four were employed, none underground, earned $1 and 75 cents.

One establishment reported 42 men employed on surface and underground work without classification or number of days employed, miners at $2.10 and laborers at $1.75 per day. Another establishment reported 11 white men on surface without classification, at $2.80 per day for 352 days.

For foremen of underground work the average wages ranged from $4.68 to $2.75 per day. Miners earned an average of $2.67 to $1.25, the lowest rate being paid for Chinamen, of whom a few were employed at small establishments.

During the census decade, 1880–1889, there were no strikes or labor troubles of any kind in any of the mines and works, and fair wages for good work was the rule for employers and employes.

The active establishments employed 62 steam motors, with a capacity of 2190 horse power, 54 boilers of 2438-horse power, one electric dynamo and motor of 4-horse power, and one water-wheel of 3 horse power, a total of 2197-horse power in motors. Two hundred and forty-seven animals were also reported as employed, but it is probable a greater number were in use.

Of the 16 establishments, the mines and real estate are valued at $640,470; furnaces, houses, and other surface improvements, $222,300; machinery, tools, etc., $146,150; quicksilver unsold, $124,074; bills receivable, $34 664; other assets, $165,456; estimated total capital, $1,331,114.

DANGER IN THE TIN PAIL.—At Elizabeth, N. J., Everett Gordon, an engineer on the Jersey Central, his wife and son were lately poisoned by eating some food which had been cooked in a new tin pail. They were attacked with severe cramps and vomiting. Prompt medical attendance saved their lives. An investigation showed that the victims were suffering from lead poisoning.

Money Saved by a Flood.

The Aspen Mining and Smelting Company will save a large sum of money as a result of the flood that drove it out of its lower levels. The company was extracting nearly 1000 tons of ore per month from that part of the property. This ore was all high grade, none of it running less than 100 ounces and much of it going as high as 300 ounces.

It is seldom that a flood in a mine results in a direct benefit to the owners, but this case is an exception. Floods are usually disastrous anywhere, but there are exceptions, as instanced by the annual overflow of the river Nile. The river enriches the ground and causes it to yield bountiful crops. The stream that poured into the lower levels of the Veteran has served a similar purpose, the ore having become more valuable while it has stood under water. It will not yield any more silver, but the silver will yield more money, and the difference amounts to a very large figure.

The mine was closed down on the 9th of May when silver was selling down below 95 cents an ounce. To-day the price is 25 cents higher than it was then. The additional amount that will now be received for the ore will be all added profit; and it is estimated that the mineral which would have been extracted during the shut-down will now bring $100,000 more than it would at the old price. This will mean $100,000 additional profit to the company, enough to pay five dividends of $20,000 each.

During the interval the company has been at work on its low-grade lead ore bodies in the upper part of the mine, which are not so much affected by the price of silver, and the management are very well pleased with having been kept out of the rich chutes. The Franklin, of course, has been quite a heavy loser, as its product would not have been heavy, but the Aspen Mining and Smelting Company can repair any damage to its work and pay its share of pumping expense without making any material inroad upon the figures representing its gain by the occurrence.

The water in the Veteran has fallen 98 feet and is now seven feet below the Franklin level. It is receding at a rate of from 15 to 18 inches per day. A further fall of 38 feet will open the second level in which there is a breast of rich ore from seven to eight feet thick.

The electric diamond drill is working smoothly. It is now being operated in the first level north. One hole has been driven 96 feet into the hanging-wall. The drill has been in blue lime all the way, but the core now shows indications of shale.—*Aspen, Colo., Times.*

Indian Territory Gold-Fields.

A Denver letter in the St. Louis *Globe-Democrat* says: For years rumors of wonderful gold-fields in the Indian Territory have been in circulation among a few of the old-time prospectors of the West. Their wealth has been reported so great as to almost stagger the most excited imagination. The Indians have, however, so closely guarded these fields that a thorough investigation has been utterly impossible. Lieutenant-Colonel S. Snyder, who was recently transferred from Oklahoma City to Santa Fe, arrived here, and during a conversation upon this matter said:

"One day last winter a stranger, who had every appearance of a prospector, came to me at Oklahoma City and introduced himself as Hale. He said he had lost his fortune and for some time had been prospecting in the Cheyenne country of the Indian Territory, north of the Red river. He had suffered many hardships, and narrowly escaped with his life from the Cheyennes, who guard their country most carefully against intrusion."

The same story was told the *Globe Democrat* correspondent recently by a gentleman from Wichita, who said: "The time is not ripe yet for the public to be informed on the subject, but there are gold deposits in the hills and valleys near the Red river which are richer than anything now known in the world. I met hunters and prospectors who have been on the spot and whose stories were so startling as to seem like an Eastern fable. I will tell you one thing, however, a big syndicate of leading politicians and capitalists has been formed, and next fall a strong party is to be started for the gold-fields to learn the truth concerning the mines. The party has already been enlisted and is backed by such men as Senator Ingalls and Senator Plumb. The district in which the gold is said to be found is in the southwestern part of the Indian Territory, about 200 miles from Oklahoma."

West American Oaks.

Some time ago James McDonald of this city generously furnished the means for the publication of the life work of the late Dr. Kellogg in relation to West American oaks. Recently a second part of the work has been published, and in a prefatory prepared by Prof. George Davidson, who was a life-long friend of the late doctor and took a good deal of interest in having placed before the public the work of his friend, the professor says: "Upon the publication of the first part of this work, the 'West American Oaks,' Mr. McDonald was impressed with the necessity of further examination and study of the new species and varieties mentioned therein. These had not been known to Dr. Kellogg; the systematic plan of collection, investigation and representation, which was his life work, being broken by declining health and adverse circumstances.

"After a few copies of the work had been sent out, the further distribution was suspended until the new species should be illustrated, and Mr. McDonald suggested that special examination should be made to secure satisfactory specimens. When the matter had been fully discussed, Prof. Greene volunteered to give his vacation for the summer to field work in the Sierra Nevada and in the Rocky mountains of Colorado and Montana. Mr. McDonald generously bore all the expenses of the trip, and the result has been the verification of former species and the acquisition of new ones. Prof. Greene has since employed his hours outside of University duties in the description of all these species, and in the direction of the drawing by Mr. George Hansen."

This addition by Prof. Greene makes the history and bibliography of the work complete, and makes it one of the most interesting additions to works heretofore published in relation to forest trees. The engravings are of the finest, and are beautiful representations of the several varieties of the oak thought worthy of illustration.

The Proctor Observatory.

Mrs. Richard A. Proctor, widow of the late Professor Proctor, who has been looking around in this State for a site upon which to locate the Proctor Memorial Observatory, recently returned to San Miguel after a three-weeks' sojourn at the Lick Observatory, and the following is from an interview she had with a representative of the San Miguel *Union:*

"Did the professors favor the location?" asked the *Union* representative.

"Unanimously," Mrs. Proctor answered as the car moved off; "they believe it is not only the place for night studies, but also to view the sun. At Lick they are unable to get the sun at all because of the altitude, the radiations reflected from the valley causing a constant disturbance. You would not think so looking off from the summit with the unaided eye, but you find out where the trouble lies in trying a telescope. Then in the winter they cannot make observations at Lick, while on San Miguel the professors believe I could have an all-year observatory. They know of this climate and give their opinions understandingly. In fact, they were enthusiastic about San Miguel and promised to aid me in every possible way. One of them offered to come down and set up the instruments."

"Shall you test the peak with a telescope this time?"

"That is one thing which brings me back. I am anxious to see Mr. A. H. Isham and arrange to take a glass to the summit. Any small telescope would answer. I have a long list of points to be ascertained, including sun-viewing and what is known as 'seeing.' What grand news it will be to write back to Lick that San Miguel stands the test! The professors were so exceedingly kind in giving me opportunities to use the instruments and also instructions as to their use."

Mining Bureau Museum.

Following are some of the recent additions to the collection of the State Mining Bureau:

Fossils from Sespe, Ventura county, and from Orange county, Cal.

Large number of specimens of gold quartz from various mines of the State.

Miocene fossils from Virginia.

Fossils from both sides of the Mother Lode of California, C. D. Voy.

Pilinite, large and very remarkable specimen, New Almaden, Cal., J. B. Randol.

Sapphires, Ceylon, Williamsburgh Scientific Society, New York.

One ounce nugget of platinum from Old Eagle mine, Trinity county, Cal., Fritz Weckel.

Platinum nuggets from Chapman & Fisher mine, Trinity county, Geo. Chapman.

Nine samples placer gold from one-fourth ounce up to one ounce weight, from a series of mines in Trinity county, showing the variation in character of the gold; from the owners of the mines.

Native mercury and cinnabar, Trinity county, Cal.

Rich argentiferous carbonate of lead ores from the celebrated Broken Hill mines, New South Wales, Australia, P. Edwards.

Hessite (telluride of silver), Carson Hill, Calaveras county, Cal.

A remarkable specimen of gold quartz from the Adelaide mine, Robinson's Ferry, Tuolumne county, Cal. The gold seems to have been rubbed down by a movement of the formation; Harvey Wood & Bro.

Pyrophyllite and glacier-polished granite, Mariposa county, D. A. Marston.

Chromic iron, copper ores, sulphur, building stones and other minerals, etc.

The number of catalogued specimens is now over 12,000, besides a large number of sundries not entered.

THE Spokane Falls *Review* says: The appointment of Mrs. N. H. Owings of Olympia to be Commissioner of the State of Washington to the World's Fair is generally commended by the press. She is the owner of considerable valuable real estate in Olympia, and an energetic woman of good judgment in business affairs.

Government Irrigation Work.

Reports in Washington correspondence bring more definite information concerning the outcome of the issue between different groups of Congressmen on the provisions for Government irrigation and the character of the work. The statement is that "the conferees on the Sundry Civil Appropriation bill have at last come to an agreement on the bothersome survey and irrigation question." The result is a complete victory for the Senate, its action in striking out the irrigation appropriation of $720,000 having been fully sustained. What the irrigation survey loses, the topographic survey partially gains, the allowance for this branch of Major Powell's work having been increased from $200,000 in the House bill to $300,000 in the Senate's amendment and to $325,000 in the conference report. The amount voted by the Senate for the public-land survey is reduced from $600,000 to $425,000. The House originally gave only $200,000. A compromise is also effected as to the land-entry question. The legislation of 1888, withdrawing from sale lands west of the 100th meridian, has been so modified that all entries made in good faith up to the time of the passage of this Act have been validated, except entries on reservoir sites which have been selected. The reservoir sites which have been selected are reserved, as under the law of 1888; and the reservoir sites hereafter to be selected are reserved from the date of their selection. In the future, whenever public lands are occupied by claimants with a view to obtaining title, the claimant can obtain title from the Government, under all the land laws, to only 320 acres.

The report of the Conference Committee was agreed to by the House and probably marks out the future course of events. It can be considered under the circumstances as fairly progressive and much can be accomplished. It will, we hope, result in a better knowledge throughout the country of the needs of the West in the direction of irrigation, and thus prepare the way for future undertakings. It is also encouraging to know that the great progress being made in irrigation will be brought out by the new census, as the "number of acres irrigated," and "number of artesian wells," were among the questions on the general agricultural schedule carried by all the enumerators. Before the life-giving waters of irrigation "the great American desert," which occupied so large a place on the maps 30 or 40 years ago, is disappearing, and truly the wilderness is coming to "blossom as the rose."

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

* Collecting assessment.
† Bullion return not received.
‡ Bullion on hand having an assay value of $220,262.60; more bullion to be heard from. Due for royalties to Sutro Tunnel Company, $10,414.50.
†† Bullion on hand, $9,500.

ACCORDING to census reports, San Francisco has 87 92 miles of street-railways, of which 47.22 miles are cables, 27.33 miles animal-power and 13.37 miles steam. San Francisco has more miles of cable-roads than any other city in the United States reported by the Census Superintendent, Kansas City having next with a cable-service of 38.68 miles.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, Sept. 6: At this mine a material reduction of the working force took place this week. About 40 hands were laid off. The mill is kept running with 20 stamps. The general belief is that it will be kept going on a small scale, while the shaft is sunk to a considerably greater depth, with a view of a more thorough prospecting. Of course the inference to be drawn from this partial suspension is that the output of bullion has not been very satisfactory. Still it is claimed the rock has paid more than expenses so far. A dividend of sixpence per share was declared and paid last month it is said out of the net profits. This is equal to 10 per cent on the capital invested. There are many who think the mine can be made to pay with careful management. E. Dye, the financial manager, returned from S. F. early in the week, and the hands who were laid off were promptly paid the wages due them.

AN IMPORTANT DISCOVERY.—S. G. Spagnoli of Jackson, Daniel Ginvannini of San Francisco and Domenico Baldi of Stockton, have located a marble ledge on Sutter creek, about four miles west of Volcano. This discovery promises to be one of great importance in the development of this county. The stone is said to be capable of a high degree of polish, and almost equal to the finest imported Italian marble, and superior to the Eastern article.

MISCELLANEOUS.—The Grass Valley hydraulic claim is now engaged in the process of cleaning up, and indications point to a big yield. Sidney James is in charge as night watchman. Seven carpenters who have been employed in the construction of the mill on the Gardiner mine, were discharged this week, owing to the near completion of the work. It is thought that 10 stamps will be started inside of two weeks. Col. W. T. Robinson, superintendent of the Sandy Bar Gold Quartz M. Co., has just completed the building of a first-class 10-stamp mill on Sandy Bar, 2½ miles above Big Bar bridge, with free water from the Mokelumne river as a motive-power to drive the mill. The Colonel has been diligently at work for one year developing several quartz ledges in this and Calaveras county, at Sandy Bar. His mill is expected to start up next week.

Calaveras.

WEST POINT.—Cor. Calaveras *Chronicle*, Sept. 6: West Point has appeared quite lively of late. All the mines around here are looking better than ever. Dr. C. H. Beals and W. Ricksnn have some fine mining properties at Railroad Flat. Also James Enright, of the same place, has struck some rich rock in his mine. Railroad will do to keep an eye on, for it is in slate formation and there have been some rich prospects found in that vicinity. The Riverside Co. is preparing its six-stamp mill, which will be ready to run in a few days. They have a large quantity of ore out and a large body in sight which will keep the mill running steady for some time to come. Mr. Watkins has struck a three-foot vein in the old Tucker shaft. It is rich ore.

El Dorado.

HENRY'S DIGGINGS.—Cor. *Mountain Democrat*, Sept. 6: Every one in this locality is well and all are at work, some mining and some prospecting for mines, both gravel and quartz; some are building quartz-mills, some building saw-mills, while others are chopping wood and burning charcoal to supply the wants of the people. Armstrong is at work in his gravel mine and is getting out some good-looking gravel. Hank Roberts has out a big pile of gravel, and is still at work. He will have a big washing by the time the water comes down in the fall. About 18 months ago Sam Lane & Co. located a lot of mining ground near the head of Clear creek, at Russian Diggings, in El Dorado county, and started a tunnel to prospect the hills. At the present time the main tunnel is in 750 feet, and they have gravel almost all the way from 2½ to 3 feet on the bedrock, that will average 2 cents in gold to the pan. There is water on the bedrock and the tunnel lacks 13 feet of being low enough to drain the channel. The gravel is capped over with white lava, and of about the same formation we have at Henry's Diggings where we find our pay. It is well known that the surface ground paid well, and it must have come from the hill. Sam is feeling well over his good prospects, and has let a contract for another 100 feet of tunnel. There is bound to be some good drift diggings found at Russian Hill, as there is a big scope of country in that part of the county that has never been prospected.

Inyo.

DARWIN.—Walker Lake *Bulletin*, Sept. 6: Parties who recently visited this old reliable camp say that a marked improvement in mining affairs there is certain to come soon. The water supply which has been short for a long time will be ample and assured with the new pipe now about all laid. The Defiance mine is said to look better than ever before; more ore in sight and of higher grade. As soon as the water works are completed the men will be transferred to the mine. Jim McDonald is in charge as superintendent, and Geo. H. Hardy, bookkeeper. Other mines will start up with the advent of cooler weather.

Nevada.

IDAHO.—*Tidings*, Sept. 5: The Idaho M. Co. has declared dividend No. 248, of $2 per share, aggregating $6200. Total of dividends to date, $5,265,310. In conversation with Mr. John Coleman a few days ago we were informed that while the outlook at the mine is not very good, the dividends have not yet all been paid.

W. Y. O. D. MINE.—Grass Valley *Union*, Sept. 6: The W. Y. O. D. quartz mine is looking fine on the 700 level in both drifts, showing a good-sized ledge of excellent milling ore. The shaft is being sunk below the No. 7 level, the vein holding regularly as to size and quality.

Plumas.

MEADOW VALLEY.—Greenville *Bulletin*, Sept. 3: Among the important mines of this section is the Diadem, the quartz and placer locations covering 478 acres. The vein has an average width of 55 feet. Most all the stoping done in the mine has been from level No. 2 to the surface. The part of the lode worked does not exceed 110 feet deep, 100 feet along the vein and 12 feet wide, the width of 12 feet being taken mainly from along the footwall. Since the erection of the mill, 10,000 tons of ore have been worked. At the southeast end of the lode, on the Big Creek side, a short tunnel and a crosscut have been run. The ore extracted from level No. 3, 8000 tons, is all on the Eagle Gulch dump, where it is proposed to erect a mill in the near future. On top of the hill, and overlying the lode, existed a gravel channel discovered in 1854 and actively worked, by the drift and hydraulic process, till 1878. From this overlying channel nearly $200,000 was taken out. Most of it was coarse gold. Several placer claims are connected with the property, a timber tract of 160 acres and four miles of ditch furnishing to the mine ample water-power for all purposes eight months in the year. In use are two Huntington mills—one five feet in diameter, the other three and one-half. The ore, however, is soft and easily crushed. The mill is arranged for steam and water power. Messrs. Edman & Malmlund, the principal owners, are putting in a Pelton wheel, which will furnish all the power needed at the present mill-site. The two Huntington mills require only 12-horse power, while the new Pelton will furnish 35. The sulphurets are becoming more valuable than it was ever supposed they would be; hence concentrating machinery will be added this fall. The company has a well-equipped sawmill on the property. Only a small proportion of the ore having been extracted, and the explorations along the vein showing it all to be of good milling quality, this is without doubt one of the best mining properties of the State.

THE MEGOWN MINE, situated about six miles from Spanish Ranch, toward Spanish peak, attracted some attention last year. Generally speaking, the ore is of a decomposed character. Mr. Megown drove a tunnel 308 feet, struck the vein and followed it 100 feet. It is from seven to nine feet thick. The ledge is a regular contact ledge, and it prospects rich. By sluicing off the top, the owner obtained considerable money.

THE CHALLEN MINE is situated on the divide between Spanish Ranch and East Branch. On the East Branch side the prospects in gravel are good, but the bedrock is pitching away. From the Spanish Ranch side a tunnel has been driven in 1100 feet.

OTHER MINES.—The Grub Fat, a placer mine, is owned by Brown & Tucker. They have just finished work for the season. The mine contains a very large body of gravel, and it has paid well. The prospects are now good. The Badger Hill property, east of Spanish Ranch, and owned by L. Jacks, is a rich mine, but it is "enjoined." Nothing but drift and bedrock work is done. The Pine Leaf, owned by Hickman, Wampler & McElroy, is a drift mine being opened up. A bedrock tunnel 800 feet long is now into gravel which prospects well. This will explore an entirely new channel in that part of the country. At Rich Bar, Alex. Buvinghausen has struck good pay in the old Rich Bar lead.

Shasta.

FRENCH GULCH.—Shasta *Courier*, Sept. 6: Capt. Clark & Co. have bought the Gladstone group of mines in French Gulch district for a reported price of $50,000. The purchasers are going to put up a 20-stamp mill, have a force of men at work taking out ore, and others engaged for carpentering, getting out timbers, and road-making. The new company is quite a boomer for French Gulch. Kline's Gulch has about 75 men at work in it, mining. Carlson has half a hundred tons of good ore at the Highland mill, and will have that much more there in a few days that prospects away up.

Sierra.

CHIPS MINE.—Sierra *Tribune*, Sept. 5: Twenty-two men are employed at Chips mine. The 12-stamp mill, which will soon be completed, is to be run by water-power furnished by the Yuba river. No. 2 tunnel is in a distance of 350 feet, and the ledge crosscutted on the 250 feet north and south. No. 3 tunnel, 450 feet lower down the mountain, has been run 400 feet. The vein will be reached in about 450 feet farther. A Burleigh is used in this tunnel. A shaft was also sunk on the ledge 50 feet from No. 2 tunnel. There is no doubt that this mine is going to prove a paying investment for its owners. The management of the mine is in the hands of Sam Locke.

Siskiyou.

SALMON RIVER.—Cor. Siskiyou *Telegram*, Sept. 6: The Know-Nothing quartz mine, superintended by Mr. Lewis Bevan, is employing nine men at present and it is the expectation that the force will be considerably increased in the near future. Some very good ore is being taken out now and ere long the company's four-stamp mill will resume operations. The Gold Run M. Co., A Dannenbrink, superintendent, have nine men at their mine and a four-stamp mill, extracting and crushing rock of a very fine quality. The Rising Sun quartz mine, J. Riley, superintendent, is being developed as fast as possible with the small force employed. The Hansen mine, the pioneer quartz mine on Know-Nothing creek, on which operations have been suspended for the last six months, has again assumed a working appearance, and ere long will be back to the ranks of a million-producing property again.

DEEP DIGGINGS.—Yreka *Journal*, Sept. 10: Messrs. Al Lash, E. A. Parlin and Wm. Bennett, formerly in the employ of Cooper, the contractor, have been at work sinking an open cut down to bedrock on Greenhorn creek, where they anticipate taking out rich pay in a short time, being now almost down to the pay streak. They keep the cut pumped out through means of a large steam pump worked by Scheld's Westinghouse engine, and expect to reach bedrock at a depth of 80 feet. These deep diggings on Greenhorn have never been opened on account of water, but all the ground worked in days past on this creek has paid exceedingly rich, and there can be no doubt of success being realized in the above-mentioned effort. Ah Giddings and Wm. Smith have some very rich mines on Hungry creek, Siskiyou mountain, only partially developed this season. They expect to do well when the first rains come, and during the winter and spring seasons.

Trinity.

THE GLOBE MINE.—*Journal*, Sept. 6: The Globe quartz mine, owned by Tighe, Weyand, Meckel and Everhart on the head of Owens creek is showing up well, although no depth has yet been attained on the vein. It has been traced for about 1200 feet and has been cut and prospected in many places in that distance. The ledge runs from 18 inches to 4 feet in width and is of high and even grade. The owners are satisfied with their prospect, feeling confident that they have a valuable property.

NEVADA.

Washoe District.

MEXICAN.—Virginia *Chronicle*, Sept. 6: 1465 level. The upraise started in the east crosscut No. 1 at a point 32 feet in from the north drift has been carried up during the week 13 feet (total hight, 30 feet), passing through porphyry which carries quartz of very low assay value.

OPHIR.—1300 level. The winze going down from this level has been sunk during the week 19 feet and connected with an old east crosscut, which we have been reopening on the sill floor of the 1465 level.

CON. CALIFORNIA & VIRGINIA.—There has been extracted during the week from all parts of the mine 739 tons of ore, which has been shipped to the Eureka mill. The average assay value of all the ore worked at that mill during the week (960 tons) was $22.11 per ton. During the last four days of the week the work of extracting ore was stopped for the purpose of making necessary repairs to the shaft machinery, and there was a loss of three days in the running time of the Eureka mill, which also was needing some repairs. Operations in the mine will be resumed next Monday. Bullion shipped to Carson Mint, assay value, $35,871.72.

SAVAGE.—During the week we have hoisted 558 cars of ore; shipped to the Rock Point mill 446 tons and milled 455 tons; average assay, $20.34. Bullion on hand, $37,000.

BEST & BELCHER.—On the 1200 level raise No. 1 is carried up 11 feet. Total hight, 40 feet. Formation, clay and porphyry.

SEG. BELCHER.—The winze below the 1300 level is in promising looking quartz carrying a small amount of metal.

POTOSI.—Bottom of the winze below the 930 level continues in porphyry and quartz.

CHOLLAR.—Regular shipments of ore about the same as last week in both quantity and quality.

CHALLENGE CON.—The joint Confidence, Challenge and Imperial west crosscut No. 2, 1000 level, is in 410 feet, 26 feet having been added, the face in porphyry.

CROWN POINT.—The 300 east stope is growing constantly narrower as it is opened north and south, and the grade is lower. Most of the ore extracted is now coming from the 300 west stope, and is composed principally of old fillings, which require careful assortment. Shipped to the Mexican mill during the week 541 tons, 1260 pounds of ore, the average battery of which was $15.03.

OVERMAN.—Extracted from 1200 level 324 tons and 1600 pounds of ore. Car samples average $17 per ton. Shipped to the Brunswick mill 302 tons and 1760 pounds of ore. Battery assays average $19.57 per ton. Of this amount, $12.78 per ton is in gold. For the month of August hoisted from the 1200 level 1641 tons of ore; average of car samples, $15.21 per ton. Shipped to the Brunswick mill 1604 tons of ore; battery average, $17.55 per ton, of which $10 is gold.

BELCHER.—The understope from the 100n level looks poor so far, but contains spots of good ore that encourage further prospecting. There is no change to report of the 300 stope. Shipped to the Vivian mill during the week 306 tons, 1030 pounds of ore, the average battery of which was $23.99.

IMPERIAL CON.—West crosscut No. 3 from the 500 foot north lateral drift is out 202 feet, having been advanced 19 feet, the face in porphyry. The south lateral drift from top of the raise on the 450 level is in 210 feet, 10 feet having been added; the face shows quartz having no value. West crosscut No. 3 from 750 north lateral drift is out 438 feet, 20 feet having been added, the face in porphyry.

JUSTICE.—Shipped to the mill during the week 188 tons, 850 pounds, the average battery of which was $36.04 per ton.

CONFIDENCE AND CHALLENGE.—The joint Imperial west crosscut No. 2, 1000 level, is out 300 feet with its face still in quartz showing little or no value.

ALTA.—The northwest drift on the 725 level still following a very promising streak of fair grade ore about a foot in width. The northwest drift on the 1000 level continues cutting stringers or feeders of good ore. The average assay of the ore extracted from the regular stopes is $24 per ton.

YELLOW JACKET.—About 600 tons of ore per week is shipped to the mill from the regular ore stopes, sample assays showing an average of about $22 per ton.

EXCHEQUER.—The east crosscut on the 500 level has its face in porphyry with clay seams.

OCCIDENTAL.—Extracting fair grade ore from the stopes on the 450 and 500 levels.

Cottonwood District.

NICKEL AND COBALT.—*Silver State*, Sept. 5: James Hendra, Jr., who arrived yesterday, says two companies are working the nickel and cobalt mines in Cottonwood, just over the county line, and there is a prospect of another company starting in a few days. Charles Bell has a large quantity of ore out and is getting material on hand to erect a furnace. George Lovelock, Sr., has organized a company which is working the mines.

ARIZONA.

GOOD ORE. — Prescott *Journal-Miner*, Sept. 3: The Howard mill, on the Hassayampa, continues to run on good ore. The Crowned King mine has 30 tons of concentrates now awaiting shipment. Work is progressing rapidly on the new roasting works being erected in Copper basin. The Skull Valley mill continues to run successfully. Mr. Rubert says the property is turning out far better than he anticipated. With the new and powerful hoist now being put up at the Congress they will be able to sink the shaft to a depth of 2000 or 3000 feet. Mr. Shekels of the Crowned King mine is expecting a lot of new machinery for their mill, which will be put up on its arrival. Owing to the heavy rains in the Black Hills and the consequent washing of the roads, the United Verde smelters have been running very light during the month of August. Teamsters have found great difficulty in moving. Roads have been put in repair, however, and teams are again moving on time. E. Burgess, who has been negotiating with Baltimore capitalists for the sale of the Tiger mine, received a telegram this morning stating that a company has been organized there and the stock taken, and work will be commenced immediately developing the mine. The property is one of the most promising in the Territory, and has already yielded a large amount of silver bullion.

MOHAVE NOTES.—*Miner*, Sept. 6: C. E. Sherman will soon commence work on the Independence at Chloride. He is putting up a new whim and getting things in shape to do considerable work before the year ends. Rogers, Shippey and Shearick, who have a lease on the Altatta dump, have between four and five carloads of ore on the way to the sampling works. Henry Matsen is in from Ivanpah with three tons of rich rock. A strike was made on the Nellie Bly mine in Wallapai mountains, by Wm. Morrison, who has a lease on the mine from the owners, W. A. Neal and T. A. Groin. A three-inch streak, which assays 800 ounces in silver and a two-foot streak which assays 80 ounces have been struck. Conkey & Brandon have thrown up their lease and bond on the Tuckabo mine. The sinking of the shaft on the Empire mine is now progressing at the rate of three feet a day. Messrs. James & Eames, who have purchased a number of mines in the neighborhood of Todd basin and Cerbat, have decided to build a five-stamp mill at the junction of the Todd and Union basin roads. The mill will be a complete one and work on the foundation has already been commenced. Mr. Eames has gone to California for the machinery.

COLORADO.

RIVER MINING.—Denver *Republican*, Sept. 4: Cass Hite, the veteran prospector of the Colorado canyon, came up from Dandy Crossing yesterday and registered at the Brunswick. Mr. Hite did not particularly desire to talk for publication, but he gave information of several large deals pending for the operation of the rich placer fields near Dandy Crossing. "Four new companies will commence operations in that vicinity this month," said Mr. Hite. "Thomas Lyle and a friend named Anderson will invest a good round sum in the development of the fields about 20 miles above the mouth of the San Juan. Mills, Haskell & Co. will also handle the fields 18 miles below, near the crossing. A party of Denverites is negotiating for the Good Hope bar, which averages about 60 cents per yard. Another syndicate is after the Tickahoo bars. Tickahoo is the Indian name for friend. A Chicago syndicate will also, in all probability, organize for investment at Dandy Crossing. I had the honor of naming Dandy Crossing, and I will tell you why I gave it the name it bears at present. It is the only wagon-road crossing for a distance of 400 miles in the Colorado canyon. It is 120 miles from any railroad. It is a picturesque spot with a labyrinth of canyons all around it, and I at once appropriated the name of 'Dandy' to it. The prospecting in the vicinity of the canyon is rather difficult to make, but I am satisfied that great wealth abounds along the towering walls of the Grand canyon. At present, down our way, the upper stream of gold comes from Gold creek. It has been prospected in places for a width of one mile. The Colorado river is heavy in rich gold bars. Rich discoveries have recently been made at the head of the placers by Jack Butler, Sumner and others. I think candidly that the Colorado placer fields are the most valuable in the United States. The gravel's lowest yield is 20 cents per cubic yard; its highest average is 45 cents per cubic yard. You may think that Dirty Devil is an odd name for a river, but that is the name of one of the streams down our way. It is about 200 miles long and will also develop good deposits."

IDAHO.

THE GOLD BELT.—Wood River *Times*, Sept. 6: Henry Donovan, the well-known mining man, went East to-day, to organize two companies to operate on the Gold Belt. As a preliminary step thereto he has succeeded in purchasing, for cash in hand, two of the most promising groups of prospects on the Gold Belt. One of these is known as the Rowley group. It consists of five claims located on Trail creek, in Little Smoky Mining District, about 3 miles from Willow creek, and about 1½ miles from the Fannie Waring mine. About $800 worth of development work has been done on the claims, and a vein carrying 9 to 13 feet of free gold ore assaying from $11 to $60 per ton, crops out boldly along all of the five claims. The other group consists of the Old Faithful, Mahel and Alta claims, situated on Willow creek, close to the old Vallandigham station, in Mineral Hill Mining District, and adjoining the valuable mines owned by Col. and Judge Donophan, of the Camas No. 2. The development work on these claims shows a well-defined vein carrying from 9 to 11 feet of free milling gold ore assaying from $13 to $160 per ton. These properties are among the choicest in Idaho, and require only the intelligent expenditure of a reasonable amount of money to make them dividend-paying propositions.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Sept. 4: W. E. Howard and John Albright of the Montezuma mine have formed a partnership with George Blethen, whereby the 5-stamp mill in Mexican Gulch will be moved over and set up on the Montezuma at once, and thus another important industry added to Alamo. The mill for its size will be the finest in camp. The large pump and boiler at the San Nicholas mine, Real del Castillo, has been bought and will be hauled up here next week to drain the Montezuma. The building for the Princessa Co.'s new mill is ready for occupancy. New buildings are being put up in various quarters. The camp is perfectly healthy and booming. The Princessa Co. is working the vein in the Ulises which was such a rich strike to the former contractors, the Newell brothers. The owners of the Aurora mine are jubilant over their property. It is at present probably the richest mine in operation here.

MONTANA.

REOPENING.—Anaconda *Review*, Sept. 6: Since the fire in the St. Lawrence has been extinguished, the work of reopening that mine and the Anaconda has been progressing as rapidly as possible, and the managers assert that the great properties will soon

be producing ore again. In the mean time the work of improvement on the smelters is being rushed, and before the holidays the Anaconda smelters will have a capacity of 3000 tons daily. The new furnaces are being completed as rapidly as possible, and the frame for the new iron building is being raised. The Alice company is following the example of its rivals, and the Alice mine is undergoing extensive repairs and improvements. The Wickes smelter is to resume operations at once, and the miners in that district are pleased with the prospect, as they have been obliged to ship their ores to East Helena. They can now have them treated at home.

ENLARGING THE SHAFT.—Butte *Miner*, Sept. 4: The work of enlarging the Gagnon shaft from a two-compartment to a three-compartment from the 600-foot level to the surface was commenced yesterday afternoon, and will be rushed as fast as three shifts of stalwart rock-breakers can accomplish it. Crews of men were put on at each 100-foot level. Below the 600-foot station the shaft is three-compartment. The size of the upper 600 is being enlarged to admit of the placing of the large hoisting machinery which has already been ordered for the property. With the present condition of the shaft the ore and waste have to be handled twice, once at the 1000-foot level and again at the 600, but the change will necessitate handling only once, which will be a great saving and convenience to the company.

NEW MEXICO.

CORA MILLER.—Silver City *Enterprise*, Sept. 6: Ten tons of ore were shipped last Sunday from the Cora Miller mine on the Mangus. The ore averages over 100 ounces per ton. The mine is owned by the Mangus Mining Co. The company will hereafter accumulate ore on the dumps instead of shipping, and when enough is on hand and developed in the mine to warrant it, a mill will be built. The Alhambra Co. of Alhambra (formerly Black Hawk) last Monday shipped three tons of ore which will average over $5000 per ton and may run as high as $8000 per ton. Ten stamps of the Pacific mill are now dropping on regular time.

OREGON.

PROSPECTING.—Jacksonville *Times*, Sept. 6: Considerable prospecting is now going on in Southern Oregon. Thirty tons of quartz from the Spence mine near Yreka recently yielded $3230 in gold. Reuben creek miners have all done well this season and made big wages, says a correspondent. The ore now being taken out at the old Swinden mine promises so well that the parties who are working it are having it sacked. Work is still being continued at the old Gold Hill mine under the supervision of E. Sanderson Smith, the mining expert, and it is reported that the prospects for a rich strike are much better than ever. The Goff & Chapin hydraulic mine in Josephine county has been bonded by the owners to Portland parties for $10,000. The same parties expect to secure options on several other mines in that section. Philip Mullen of Steamboat was here on Wednesday, from whom we learned that work is progressing on the shaft of the mine controlled by E. S. Smith as rapidly as possible, and that the prospects are good. San Francisco capitalists and mining experts have bonded the group of copper mines near Waldo, with the intention of soon developing same, and possibly constructing a railroad to the main line to transport the ore, which is very rich, assays showing 40½ per cent of copper.

UTAH.

ORE SHIPMENTS.—Park *Record*, Sept. 6: The ore shipments this week aggregate 1,819 540 pounds, or nearly 910 tons. It is expected that the ledge in the Alliance will be cut by the tunnel in a very short time. The ore showing in the new workings of the old McHenry mine is constantly improving. A force of 21 men is employed at the Woodside. The Nevada-Northland leasers' mine appears on the list of shippers this week. A force of 20 odd men is employed in the mine and a big lot of stoping ground has been opened up. It is currently reported that operations will be resumed shortly on the Wilson and Barrett property which adjoins the McHenry on the west. Messrs. Holden, Kirby and Morse, the Colorado smelting and mining operators, left for their homes last evening. They are so well pleased with the workings of the Russell leaching or lixiviation process here that they will at once have a Russell plant erected at Aspen, having been convinced of the adaptability of the new process for their Aspeo ores.

WASHINGTON.

PAYING DISTRICTS.—Seattle *Press*, Sept. 6: The interest taken in mining in Western Washington is constantly increasing. Some good paying districts are being opened up and there is considerable activity in prospecting. Old miners and prospectors who have withdrawn from the business are again attracted because of the recent finds to their old vocation, and are now deeply interested as in former days, when such districts as the Fraser attracted thousands of miners in a few months' notice. Not only is considerable attention being given to the Silver creek, the Sultan river, and the Snoqualmie districts, but also to the Olympic mountains. The *Press* exploring party advertised this region far and wide, and since the party's explorations many parties have been organized and peoetrated the formerly unknown, and in no few instances report deposits of valuable mineral ores. Development of the mineral resources of the Silver creek and Sultan districts is constantly progressing, but is retarded to no little extent, owing to the lack of facilities for ingress and egress and ore traosportation. Mr. S. G. Dewsnap, an experienced miner, thoroughly familiar with and greatly interested in the Silver creek district, was seen yesterday by a *Press* representative and said that a discovery of a veio of antimonial silver was recently made in the northeast part of the heli, and is making a very good showing. The Silver creek district io which mining locations have already been made, consists of a belt of about five miles long and three miles wide. The veins are well-defined and regular. Miners are doing their assessment work on the different veins, and wherever they are exposed some very good showings are made,

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 2, 1890.

435,785.—GATE—Jos. Albers, Corvallis, Or.

435,553.—KNIFE-SHARPENER — J. S. Blood, Napa, Cal.

435,622.—ORE-CRUSHER—John M. Bryan, S. F.

435,556.—SAW-BIT HOLDER—S. H. Chase, San Jose, Cal.

435,557.—CHIMNEY—L. E. Clawson, S. F.

435,561.—CLOTHES-DRIER—F. Frank, Suisun, Cal.

435,562.—CONCENTRATOR — Geo. Gates, Drytown, Cal,

435,563.—PLATE-LIFTER—D. B. James, S. F.

435,840.—SOLDERING-CAN BODIES—M. Jensen, Astoria, Or.

435,651.—FRUIT-STONER—P. Maisonneuve, Oakland, Cal.

435,569.—INSECTICIDE—W. Mann, Fresno, Cal.

435,567.—GANG-PLOW FRAME—A. F. McMillan, Benicia, Cal.

435,854.—DECORTICATING MACHINE — J. L. Notley, Santa Cruz, Cal.

435,462.—YARN-WINDER—J. A. Shepard, Fossil, Or.

435,592.—JOURNAL-BEARING — F. H. Smiley, San Jose, Cal.

The following brief list by telegraph for Sept. 9 will appear more complete on receipt of mail advices:

California—Thomas B. Craycraft, Pooocho, waterway and gate for reservoirs; Ferdinand Fraok, Suisun, sash-holder; John Cluty, San Diego, pipe coupling and expanding metal le sleove; R. H. Sinclair, Alameda, assignor to the Sinclair Manufacturiog Company of California, windmill; William Stephens, Santa Rosa, electrical traction apparatus; George H. Tucker, San Francisco, die for making lathing; Stefano di Vicchio, San Jose, and J. Mignola, San Francisco, refrig rator.

Oregon—Lewis J. Bergondahl, assignor of two-thtrds to Mr. Taylor, Pendleton, Or., and J. Gagen. Port Townsend, Wasb., snow-plow; Thomas P. Madill, Albany, fence making machiue; Charles W. Freuain, Portland, steam ore stamp.

Washington—Jane Ford, Ross Station, steam cooker; Peter E. Frost and L. A. Connor, gaff point for vessels.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONCENTRATOR.—George Gates, Drytown, Amador county. No. 435,562. Dated Sept. 2, 1890. This is an improved apparatus for separating fine, heavy, valuable substances and sulphurets from the coarser sand, gravel and gangue, so as to concentrate and save the former and allow the latter to pass off. It consists of a series of tables with peculiarly arranged supply and distributing devices, which cannot well be described briefly without the aid of engravings.

GANG-PLOW FRAME.—Alfred F. McMillan, Benicia, assigoor to the Benicia Agricultural Works. No. 435,567. Dated Sept. 2, 1890. In the coostruction of gang-plows it is customary to unite the beams together by means of iotermediate strips, braces, or plates of iron, which are bolted through the sides of the adjacent beams by bolts or nuts; but with the strains which ordinarily are brought upon the plow frame through the plows, which are supported from each beam, these braces become loosened and the frame loses its rigidity. This improved frame is especially applicable to that class of plows having two or more parallel iron beams to each of which a plow is conoected. The patent consists in the combination with the beams of a gang-plow, of diagonal plates extendiog across the beams in pairs, one above and one below, with spurs or projections fixed in the beams and extending into corresponding cavities in the bars, with bolts and outs whereby said nuts are clamped to the beam.

CLOTHES-DRIER.—Ferdinand Fraok, Suisun, No. 435,561. Dated Sept. 2, 1890. This rack for drying clothes consists of an arraogement of telescopic tubes having transverse openings made io them to receive rods or bars upoo which the clothes are suspended, and a means for suspeoding the device and raising and lowering it.

CONTINUOUS SECTIONAL CHIMNEY.—Leooard E. Clawson, S. F. No. 435,557. Dated Sept. 2, 1890. This continuous sectional tube or chimney consists in the combioation of an inner tube made io sections of earthenware having the adjaceot eods made one with a flange aod the other adapted to fit therein, an exterior sheet-metal tuhe of sufficient diameter to fit around the flanges of these joints, a filling of plastic material which will set and become hard, a band surrounding each joiot and having lugs which form guides for a second exterior metal tube which provides an air space between the two. It also consists in the base for the support of said chimney raised so as to provide an air space beneath this base and between the chimoey and the floor upon which it rests.

KNIFE-SHARPENER.—Joel S. Blood, Napa City, assignor of one-half to Emanuel Manasse. No. 435,553. Dated Sept. 2, 1890. This ioveotion relates to that class of devices for sharpening knives in which opposing cooverging steel edges are used, between which the knife-blade is drawn, and especially to that sub-class in which the edges are those of steel disks or plates mounted axially upon a stock and adapted to be adjusted to present fresh edges when required and fixed in the positions to which they are adjusted. The object of this invention is to provide a simple aod effective knife-sharpener, the disks or plates of which are formed with improved sharpening edges projecting from their peripheries and adapted to be successively brought into use as required.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 11, 1890.

Holidays the past week interrupted general trade, but now business is resuming its wonted sway. The city is crowded with interior merchants who are sampling along the line preparatory to buying.

The local money market is easy. Remittances are free, much more so than at this time in 1889, while the call for accommodations is lighter. Country realty is advancing quite rapidly, under a renewed inquiry for small farms by new-comers. The heavy purchases of U. S. bonds by the Treasury is a contributor to the general ease. Considerable were sold on this coast. The total purchases will aggregate $50,000,000.

The steamer Oceanic for China, took out the following treasure: To China, Mexican dollars, 72,165; gold coin, $35,157; gold dust, $720; currency, $815; total, $108,867. To Japao, the steamer took out 56,000 Mexican dollars.

The last steamer from Australia brought in $500,000 in English gold coin. It went into the miot for recoining.

MEXICAN DOLLARS—The market is dull at 92@92½c. A large demand is expected to set in with the return of Chinamen from farm work. When silver bullion was the highest, some Mexican dollars were melted and sold to the Government as bullion.

SILVER—The market abroad and at the East set back the past week, which goes to show that the present silver law is far from satisfactory. The necessity of remonetizing silver by passing a free-coinage Act is made apparent by the speculative action of the metal. Owing to the festivities the past week, purchases of silver, if any, by the Department were lost sight of—oot telegraphed; consequently we cannot give them in this issue.

QUICKSILVER—Receipts the past week aggregate 335 flasks, and exports hy sea 300 flasks to China. The market is steady, with a firm tone.

LIME—Receipts the past week aggregate 2385 bbls. The demand, both home and export, is light.

BORAX—Receipts the past week aggregate 2075 ctls, and exports by sea 1184 lbs. to Japan. The market is steady under a good Eastero inquiry.

LEAD—The market is very strong at another advance. The combinations at the East appear to be forcing prices up.

TIN—European and Eastern markets have advanced. The higher range is due to confirmed reports of a lessened output of straits, which brought both speculators and consumers into the market.

COPPER—The market holds to strong prices. Europeao statistics show that the visible supply in England and France decreased nearly 2600 tons last month, with a decline of 2350 in the quantity of fine copper held io Eogland, the most noteworthy change. The deliveries were 1900 tons less and the supplies received 2400 tons less thao in Septemher last year.

IRON—Imports the past week aggregate 600 toos pig from Iroodale. The market retains the steady tone heretofore noted, under a fair demand and gradual lesseoing stock. English and Eastern advices report more active markets, with furoaces generally well sold ahead.

COAL—Imports the past week aggregate as follows: Naoaimo, 1476 tons; Seattle, 2002; Tacoma, 13,610; Comax, 4300; Newcastle, N. S. W., 2234; Departure Bay, 2480; total, 26,039 tons. The market holds to full prices. Although there is a good demand, yet it does not appear to be quite so sharp. The late scare about short supplies caused many consumers to purchase ahead. It oow looks as if the Australian shipments will not be interrupted, while Englaod will increase her shipments to this port. The Wellingtoo collieries will soon hegin to put out their regular quota. Other coast collieries' output is larger.

Eastern Metal Markets.

By Telegraph.

NEW YORK, September 10.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	54⅜	1 17½	$17 00	$4 82½	$22 10
Friday	54	1 10½	17 00	4 87½	22 20
Saturday	54	1 10⅜	17 00	4 92½	22 15
Monday	53⅜	1 16½	16 85	4 95	22 25
Tuesday	53⅜	1 16½	16 85	4 92½	22 25
Wednesday	53⅜	1 17	16 90	4 92½	22 25

NEW YORK, September 10.—Quicksilver steady; 75@76c last. London, Rothschild prices, £10. Borax, demand moderate; no higher. Copper, demand moderate. Lake ingot, 16⅞@17c; Arizona, 15¼@15⅝c; casting, 14¼@14⅝c. Pig Lead is higher; 1000 tons, $4 80; closing prices, $4.85@4.90.

MECHANICAL PROGRESS.

Increasing Use of Structural Iron.

Probably the best idea of the immense progress which is being made in the use of structural iron and steel may be formed from the announcement just made that several iron-brokers have just organized a company capitalized at $5,000,000 for the manufactnre of structural iron to be used in buildings, bridges, ships, etc.

The plant will probably be located in or very near to Chicago. Although of very recent growth, the demand for this kind of iron, or steel, rather, is enormous. The quantity needed for a large modern building would be equal to half a hundred miles of rails for a railroad. Architects and owners have passed favorable criticism upon steel structnres, and it is believed the demand will increase. The prediction is made that structural iron will soon be used in smaller buildings, as residences, flats, etc.

Steel-makers are rapidly becoming aware of the character which structural metal should possess, and nearly every day some new feature of special excellence and value is revealed. Some time ago it was announced in the French papers that a system of building houses of steel plates had been introduced hy Mr. Danly, an iron manufacturer in France, and that it had received a fair degree, first of interest, and then of public approval.

Mr. Danly satisfactorily ascertained that corrugated sheets of steel, no more than a millimeter in thickness, are sufficiently strong for building houses several stories high, and the material used allows of quite a variety of architectural ornamentation. The plates thus employed are of the finest grade of structural steel, and galvanized after they have been cut to proper shapes and sizes, so no portion of them is subject to atmospheric exposure. In a sanitary sense such houses are deemed very satisfactory and capable of being thoroughly ventilated and heated.

The exportation of iron houses is becoming an important business in England. Of course they would be better if made of steel, but the class of persons for whose homes they are designed prefer cheapness to superiority, and hence iron is adopted. These houses are considered practically indestructible, and possess the advantage of being perfectly impervious to atmospheric moisture. One of them, suitable for a family of four persons, can be erected within a fortnight and costs about $1000.

In the Philippine Islands and in some other localities where earthquakes are more or less frequent and severe, the people have commenced putting up iron edifices to resist the seismic influences.

The progress of building in this country, however, has passed the iron age, and that of steel is at present dominant. Gradually the use of steel for this purpose will become general, as the value of it increases in appreciation, and the steel house as well as the steel office building will be common along our streets.

The greatest triumphs of steel construction are seen in engineering projects—in bridges and towers—like those at Brooklyn and Niagara and across the Forth, and the Eiffel tower. These will serve as examples of first-class steel construction, and on their stability and endurance still greater works will probably be based.

Hardened Copper Bearings.

The tempering or hardening of copper is commonly looked upon as a myth, or a "lost art," which in nine cases out of ten means a "myth;" but it seems that copper can be hardened, and such treatment is now a regular commercial business. A company at North East, Pa., furnish hardened copper to order for any of the various uses where alloys have been previously employed.

Tests have been made of the hardened metal, at Pittsburg, showing tensile strength of 64,480 pounds opposed to 23,530 pounds for soft copper. The ductility of the metal after hardening remains even greater than before. Several railways have this hardened copper in use for locomotive bearings, and an electrical company at Philadelphia have been using it for dynamo and motor bearings, also for brushes, commutator strips and other purposes.

Copper is the base of nearly all the different alloys employed for machine bearings, and may be called the "active element" in such bearings. Its molecular or atomic structure varies from steel and iron more than in the case of any other available metal, consequently "interlocking" or abrading is less liable to occur. The term "anti-friction," so far as we know, applies to a difference in structure or "grain" of metals, accompanied with other qualities, such as hardness and the maintenance of form. It is true cast iron on cast iron makes a durable and anti-friction bearing, but this may be owing to the interstices for retaining lubricants and hardness, a supposition borne out by the fact that the risk of "seizing" or "cutting" is so great with such bearings that they are seldom used.

We strongly suspect that for bearings, when one member is made of soft iron or steel, hardened copper will be found the best material possible for the other part. It is true copper is an expensive metal, much more so now than it ought to be or is likely to be in future, but this will not matter much for lining metal if some plan is invented of applying a thinner shell. There is no doubt, in the case of any lining metal, that if it were thinner and soldered firmly to shells it would be much better than cast in and held only by mechanical fastening. In the case of solid bearings in cast iron, bushes of sheet copper, No. 14 for example, can be inserted and "expanded in" much cheaper than by the common method of casting, turning and fitting brass bushes.—*Journal of Industry.*

Steel Rules.

There are few branches of the engineering trades that require the exactness and precision requisite in the manufacture of steel rules, standards and measuring instruments. Accuracy and reliability are the two absolute essentials. In the general practice, the steel blades, after being prepared, by being ground, glazed and tempered, are coated by an acid-resisting varnish, especially made to suit the requirements of the trade, for upon this depends, in a great measure, the clearness of the divisions when etched. The varnish being dry, the blades are placed upon the table of a pantograph, which might well be termed a copying machine, as its work is to transfer to the steel blades, in a diminished size, any marks, letters or figures that may be traced from the copy. The latter is a plate of thin zinc, or any suitable metal, usually four times larger than the rules to be made—the divisions, figures and letters all being made four times larger than they are required to be when engraved upon the steel blades. The object of this increased size is to diminish any imperfection that may exist upon the copy.

There is a tracer connected by a system of steel bands and pulleys to the table, so constructed as to move in two opposite directions at right angles to each other. Above the table are fixed two rows of holders, each having a diamond point. These holders are raised and lowered at the will of the operator by a treadle, so that both divisions, figures and letters are traced from the copy and transferred, in a diminished proportion, to the steel blades. The diamond points being required only to cut through the varnish, the blades are taken from the machine and etched, the acid burning away the steel wherever the diamond point has been traced.—*London Machinery.*

FORCED DRAUGHT.—There have been many failures of boilers in the British navy, as well as in our own, under the operation of forced draught. This is accounted for by the Chief Inspector of Machinery as follows: The intense heat in the combustion chambers and tubes, generated by the "blowpipe" action of the forced draught, quickly evaporates the water in contact with the plates, and great quantities of steam are given off from them. The steam, in passing through the water, lifts it to some extent away from the plates, so that what is in contact with them is not water, but a mixture of water and steam, and while this is sufficient to prevent serious softening and bulging of the plates, it does not prevent so much overheating as to make the tubes and stays give way under the strain due to end-on expansion of the furnaces and tubes. The inspector advocates the use of larger boilers, that will supply full steam with a very low air pressure—equal to one-half inch of water.

ADVOCATES for the new system for converting malleable iron into cast steel claim that they have at their command the means of converting malleable scrap iron into the finest kind of cast steel in two hours. They claim that by a special flux and welding-process, tool and cutlery steel can be produced worth as high as $250 a ton at a cost of less than one-half cent a pound. This, they say, can be done with scrap iron worth $8 a ton, whereas pig iron, from which most steel is made, costs $18 a ton. The advantages claimed are "the saving of time in the conversion, the cheapness of the raw material and consequently of the finished product, the durability and hardness of the converted article and its resistance to corrosion."

MANGANESE PLATING OF IRON AS A PROTECTION FROM RUST.—According to our Italian contemporary, *Progresso*, articles of iron can be protected against rust by sinking them near the negative pole of an electric bath composed of 10 liters of water, 50 grammes of chloride of manganese and 200 grammes of nitrate of ammonia. Under the influence of the current the bath deposits on the articles a film of metallic manganese which prevents them from rusting.

MULTIPLICATION OF ELECTRIC INDUSTRIES.—Six years ago there were scarcely a hundred electric motors in operation in the United States for any purpose; to-day there are not less than 15,000 motors in use, applied to not less than 200 different industries, and an industrial revolution is taking place equaling, if not surpassing, in importance that attending the introduction of the steam engine, and marvelous in the rapidity of its growth.—*Sprague.*

ALUMINUM.—It is not generally known that one cubic inch of pure aluminum weighs one-tenth of a pound avoirdupois, or about one-fourth the weight of an equal bulk of pure silver. It can be rolled, spun, stamped, engraved, burnished, polished and soldered to about the same extent and process as used on brass.

SCIENTIFIC PROGRESS.

Wonderful Revelations.

After an exposure of 33 minutes a good telescope will record on the camera within its field a number of stars, which, if the field could be extended over the whole heavens, would give us a grand aggregate of 134,000,000 of stars. If the same instrument is allowed an exposure of one hour, the record will reveal the existence of the enormous aggregate of not less than 400,000,000. And this may be considered as embracing merely the nearest borders of space, which is in fact infinite in extent. Never before in the history of science has humanity been able to penetrate so far into the profundity of space or to find such a visible record of the infinity of worlds. The most perfect eye, aided by the most perfect instrument, without the camera, is able to detect the existence of not more than about 40,000,000 stars. This much has been accomplished by the scientific application of instruments to date. What will be the outcome of the future in this direction who can tell?

That there are stars not visible through any telescope, and which no telescope in the future will ever be able to reveal, which can yet be weighed, measured and their velocity calculated, seems almost incredible, yet the new developments of science make this possible. Dr. Klein contributes to the *Popular Science Monthly* for August a paper on the discovery of these invisible worlds, whose wonders surpass any marvels of romance or fable. The wishing hat of Fortunatus was not more marvelous than late revelations of the new science. Its peculiar property is that "it recognizes mutual relations between objects apparently lying far from one another, connects with one another phenomena which appear to have no common measure, and draws lines of connection between earth and sky." The spectrum analysis is the means by which this is done, and on this is founded the chemistry of the stars. It is shown that if a body is receding in space, the dark lines in the spectrum incline toward the red; if it is advancing and approaching the earth with rapidity, the lines incline toward the violet rays. This spectro-graphic method is that by which the most important discoveries in astronomy are now made. It is only recently that instruments sufficiently delicate to register these phenomena accurately have been perfected.

In regard to distances between the stars, the following will furnish abundant food for thought in connection with the above: "The star which gives the greatest parallax of any, and which in consequence is believed to be nearest to the earth, is Alpha Centauri, a star never visible in this latitude. But even this star's parallax is only 93-100ths of a second, which corresponds to a distance of 221,000 times the sun's distance from our earth, or over 20,000,000,000,000 of miles." It is but fair to assume that this is approximately not far from an average of inter-stellar distances. When we take into consideration the fact that we can have placed before our photographic vision 400,000,000 of suns like our own, existing in space, with such immense distances between them, and that even our enlarged vision can take in but a mere speck of the universe, we are utterly and absolutely lost in the contemplation. Nothing but an infinite mind can appreciate such wonderful revelations.

SLIME DEPOSITS IN WATER.—In storing "potable" water, in either ponds or tanks, there is nearly always neglect of means to cleanse the sediment deposited. Where such sediment comes from, especially in tanks fed by springs, is not easy to determine; but that there is a deposit of from one to two inches of black slime each year, is obvious enough. This slime is filthy in the last degree, and the water is spoiled. The sun has some strange effect in such cases. Covered tanks or pools do not become stagnant, or rarely do, while open ones without circulation are certain to become coated with a vegetable growth on the sides that is marvelous. This is especially true of artesian water when it is warm. At Stockton, a few weeks suffices for a thick, green vegetable growth on the sides of the pools, which decays, falls to the bottom and produces the black slime before mentioned. In the case of pools or reservoirs with sloping bottoms there is an easy remedy by providing a catch-basin or pocket, with a "blow-off" outlet. There is always some risk in direct pipes to the bottom of a reservoir, but the arrangement is common, and a service-pipe and blow-off, or cleaning-pipe, can be carried in together, the inlet of the former being fixed above the catch-basin or sump. Another way would be to put a siphon-pipe into the sump so that it could be cleaned to some extent without emptying a reservoir.—*Industry.*

LUMINOUS WATER.—Ernest Fahrig, in the *Chemical Trade Journal*, narrates that, being in a dark room, having in his hand a sealed bottle partly full of a solution of ozone in water, he idly shook it up; whereupon a soft phosphorescent glow of light floated above the surface of the water and pervaded the space in the upper part of the bottle. The appearance was only momentary, but on shaking up the liquid again immediately afterward, the light reappeared, although in much diminished intensity. Further repetitions of the shaking failed to produce any results, but after an interval of ten days the liquid had apparently regenerated its luminous power, for the same effects could be produced with it, although weaker. The phenomenon was afterward observed in another way, and some specially remarkable results were obtained by pouring a small quantity of an ozone solution into a glass beaker containing ordinary water. At first the cone-like projection of the solution, where it falls into the water, becomes luminous, and then the light suffuses the whole mass as the liquids become thoroughly mixed, finally dying away. It is described as a soft phosphorescent glow, which quickly spreads over the mass of fluid or gas, as the case may be, and as quickly disappears.

NATURE OF HEAT.—The real nature of heat is unknown. Scientific opinion is divided between two views respecting it. These are the corpuscular or emission theory and the undulatory theory. According to the emission theory, heat is a subtle fluid, destitute of weight, existing in all bodies, is capable of flowing from one body to another, and, though attracted by particles of other bodies, its own particles mutually repel each other. According to the undulatory theory, heat is attributed to the vibratory movements of the molecules of a hot body communicated to those of other bodies by means of a highly elastic fluid called ether, in the same manner that sound is transmitted through air. This ether pervades all space and, by other kinds of motions, is supposed to produce light and electricity. By the former theory, bodies cool by losing a portion of this subtle fluid. By the latter, they simply lose a part of the vibratory motion. Herein the emission theory, for convenience of explanation, is assumed, though at present the undulatory theory is generally received.—*The American Engineer.*

A NEW WAY OF MEASURING CURRENTS.—In 1851, Wiedemann discovered that if a tube containing bisulphide of carbon is surrounded with a wire carrying a current, the rotation of the plane of polarization is exactly proportional to the strength of the current. Starting from this point, M. d'Arsonval has devised a very simple arrangement for measuring currents and testing the accuracy of ammeters. In the apparatus recently shown to the Societe de Physique, a coil of wire was wrapped around an ordinary saccharimeter tube containing pure water or bisulphide of carbon. The E. M. F. of a single Leclanche cell will cause a rotation of one degree. The apparatus can be made as sensitive as one pleases, since for a given current the sensibility depends simply upon the number of convolutions of the coil.—*Electrical Engineer.*

NOT SATISFACTORY.—It is said that the electrical machine used in counting the census returns is not giving as satisfactory results as was expected. It works rapidly and wonderfully, and is a great labor-saver for the 1700 clerks in the Census Bureau, but it is a curious matter of experiment that the same machine will never count the same pile of returns twice with the same result. Under a challenge from an official in the bureau, 13 tests were made, and the only result that seemed at all accurate was a single footing in one district that was the same as that reached by counting in the old way by the clerks. The 1700 census clerks might have to work harder and longer if they should themselves count the returns, but the final result would be more accurate.

SPEED OF FISHES.—The dolphin and bonito are thought to be the fastest fishes, and although their speed is not known, those who claim to have made close observations say they are fully capable of 20 miles an hour. The writer has seen a school of four or five dolphins sport back and forth in the foaming water in front of a ship's prow, which must have been moving through the water at least 12 miles an hour, almost as if the ship was still. Of course the dolphins must have made a turn at every boat, and the boats were not less than 20 or 30 feet in length. A fish that could do that must have had the power of moving much more rapidly than 20 miles an hour in a direct line.

A NEW PHOSPHORUS COMPOUND.—Prof. T. E. Thorpe, the well-known chemist, has discovered a new compound of phosphorus (P_4O_6), which takes the form of acicular crystals, melts with the warmth of the hand, and glows under the same conditions as phosphorus. It burns readily in oxygen and chlorine, and forms a new compound with ethyl alcohol.

THE DEPTH OF THE MEDITERRANEAN.—It has hitherto been supposed that the maximum depth of the Mediterranean was 10,785 feet between Sicily and Sardinia. Lieutenant Magnaghi of Italy has found a depth of 13 550 feet between Malta and Candia.—*Revue Geographique.*

JAPAN'S LITERARY WELFARE is looked after by 475 newspapers, magazines, etc. Tokio alone boasts of 16 daily newspapers. It is imperative that each officer of the government should subscribe to the government organ *Kwampo.*

THE HUMAN EYE.—It is a well-known fact in science that the eyes are more the epitome of the man than all the other features that may help to suggest character.

ELECTRICITY.

The Ries Electric Traction Increaser.

The claims set up for this invention are attracting much attention in engineering and railroad circles. Quite a number of experiments have been made, and several exhaustive papers have been read before different societies. If the claims in its favor can be made practical, the invention will prove one of the most valuable in relation to railroad economy which has been made since the modern locomotive has been introduced. The most important series of experiments reported are those quite recently made under the immediate direction of the inventor, Mr. Elias E. Ries. It is claimed that this experiment showed that the invention, when properly applied to the ordinary tractive-power of locomotives, increased that power fully 25 per cent. In alluding to this series of experiments, *Electric Power* says that if the above claim can be realized, the following advantages will arise: Engines thus equipped will be enabled to draw longer and heavier trains, to mount steeper grades and to make better time; that the wear and tear upon the wheels and rails due to slipping and the use of sand is avoided; that light locomotives having sufficient steaming power can do the work of heavier engines, thus avoiding the increased strain upon rails, roadbed, bridges, etc., and in many instances rendering the reconstruction of the latter for heavier traffic unnecessary; that the condition of the weather cannot affect the schedule time by reason of lessened tractive adhesion, as at present; that trains may be brought under headway and stopped more quickly by reason of the absence of slipping of the drivers due to the action of the current; that the consumption of fuel for generating the traction current is considerably less than the saving in fuel effected by the absence of slipping alone; that in many cases the running of passenger and freight trains in separate sections may be avoided, as well as the expense and delays to traffic occasioned thereby; that a passenger or freight train drawn by a locomotive equipped with this system is safer and under more perfect control on steep grades, and finally that the earning capacity of a line of road having its engines so equipped can be very largely increased.

If the results of the experiments, as reported, are correct, there can be no doubt of the many advantages, as above set forth. But before the results claimed can be accepted and practically acted upon, these experiments must be further continued and more clearly wrought out. *Engineering News*, in commenting upon the subject, says: "Two facts may be considered as settled: (1) Under certain conditions electric currents of the proper volume and tension do increase by a large percentage the frictional adhesion of wheels to rails; and (2) if this can be effected with locomotives by plant of a simple and practicable kind, it will result in an important increase of their economic efficiency.

"The first of these we believe to be established beyond question by the experiments of Ries, Daft, Lyons, Levy and Schmidt, to mention no others. In a case of this kind, as in most others, negative evidence is of minor importance. The testimony of one credible witness that he heard a bell ring justly outweighs the testimony of a dozen that they did not hear it; and the testimony of two or three credible witnesses that they have produced certain effects with electricity, or with any other agent, justly outweighs the testimony of many others that they have tried to produce the same effect and failed. Their conditions may not have been the same. The conditions for increase of tractive friction are said to be the use of a low-tension 'quantity' current flowing in a closed circuit of low resistance moving with the motor; and we think the evidence is good that in this way effects can be produced which cannot be accounted for by natural friction or magnetic attraction, or both, and which seem to imply some molecular effect of the current on the metal."

In another article the same authority says: "Does the passage of an electric current from a wheel to the rail upon which it rests or rolls increase the possible traction with that wheel under a given load in practical service? This is a question which has been confidently answered in the affirmative by reputable engineers, and as confidently disputed by men of equal reputation.

"The results of careful experiments are said to have absolutely proved the theory, while other careful experiments are said to have wholly disproved it. On the whole, the burden of evidence is in favor of there being some possibility here which may prove to be of practical importance, and which imperatively demands further practical investigation.

"Perhaps the strongest evidence that the electric current does increase the coefficient of friction was given in a paper read a year ago by Mr. Leo Daft before the American Institute of Electrical Engineers."

After quoting somewhat largely from that paper, the *Engineering News* closes the subject by saying: "This much we may say, that there is probably no improvement which could be applied to the locomotive which promises such great results as an *effective* traction increaser. Mechanical devices to increase traction have been open to the objection that they increased to a dangerous degree the weight upon a single axle. One of the most important reasons for the economy with which American railways are operated is the large trainload hauled. If the electric traction increaser is successful in accomplishing what is hoped for it, the way will be open for a further large advance in this direction, with resulting gains in economy of service, which, from a financial view, are of many times the importance of any possible gain in any other direction."

GOOD HEALTH.

Effects of Poisons.

One of the most mysterious of physiological phenomena is the influence of minute quantities of certain substances when introduced into the circulatory system. The wonderful effect of vaccination is familiar to all, and even more remarkable are the terrible results produced by a mere trace of saliva from a hydrophobic animal—a poison which, apparently, remains dormant in the body for days, weeks, or months, and then suddenly springs into fatal activity. Similar effects follow from inoculation with the venom of serpents, but in such cases the poisonous effects occur almost immediately.

Even more powerful are the poisons used by the natives of Africa to render fatal the wounds made by their arrows, as described by Mr. Stanley in his recent work on Africa. These, when fresh, are of most extraordinary power. Faintness, palpitation of the heart, nausea, pallor, and beads of perspiration break out over the body with extraordinary promptness, and death ensues. One man died within one minute from a mere pinhole puncture in the right arm and right breast. A headman died within an hour and a quarter after being shot; a woman died during the time that she was carried a distance of a hundred paces; others, in varying spaces of time up to a hundred hours. The activity of the poison seemed to depend on its freshness. The treatment adopted was to administer an emetic, to suck the wound, syringe it, and inject a strong solution of carbonate of ammonia. This carbonate of ammonia injection seems to have proved a wonderful antidote if it could be administered promptly.

One of the poisons with which the weapons are smeared is a dark substance like pitch. According to the native women, it is prepared from a local species of arum. Its smell, when fresh, recalls the old blister plaster. It is strong enough to kill elephants. This poison is not permitted to be prepared in the village. It is manufactured and smeared on the arrows in the bush. All these phenomena are certainly wonderful and unexplainable; but for that matter, there is hardly any action taking place in the living body of which we can form any satisfactory conception of the true nature.—*Popular Science News.*

A MUCH-NEEDED ENTERPRISE.—San Francisco is to be blessed with a medical and surgical dispensary, one of the largest in the world, to be known as the Cosmopolitan Dispensary. The gentlemen in charge of the enterprise, who are men of means and great experience in medical matters, have leased and thoroughly remodeled the building at the junction of Market, Stockton and Ellis streets. There will always be in attendance a staff of eight physicians, six of whom will be in charge of the four consultation-rooms, which will be open to the public from 8 o'clock in the morning till 10 o'clock at night. Upon one physician, assisted by a pharmaceutical graduate, will be imposed the task of managing the medicine and express rooms, where all medicines intended to be sent to out-of-town patients will be prepared. The physician-in-chief will have charge of all correspondence, and will be assisted by 16 stenographers. All prescriptions will be carefully compounded by a skilled graduate, and all drugs will be bought at wholesale and retailed to patients at first cost. All correspondence will be kept perfectly secret and either burned or returned to patient. No charge will be made patients for examination, and if there is no cure the patient will be informed of the fact. The gentlemen in charge will only take cases they can cure, and whenever they fail to effect a cure they will make no charge.

THE PHONOGRAPH AS A DISSEMINATOR OF DISEASE.—It is reported that the Philadelphia park commissioners have ordered the disuse of the public phonographs heretofore in use in Fairmount Park, on account of the danger of their serving to disseminate disease. This danger is doubtless very slight, like that of injury to the ear, and probably neither danger is worth consideration if the instrument is kept reasonably clean and used properly, but its promiscuous use in a public park does not seem to admit of perfect security in this respect, and the announcement that the phonograph company intends to substitute a plate ear-piece for the penetrating one now in use, avowedly for the reason that there are persons who object to the present form, goes to show that the Philadelphia commissioners are not the only people who entertain the idea of danger in the phonograph. —*N. Y. Med. Jour.*

FAITH AND MIND CURE.—Charles Dudley Warner is quoted as saying that the difference between "faith cure" and "mind cure" is that the "mind cure" doesn't require faith and the "faith cure" doesn't require any mind.

SHOP NOTES.

Chisels.

In mortising without a machine, grind your chisel to a long basil or bevel. It will drive easier with a mallet.

Keep the flat side of the chisel facing the marks.

Grind the chisel on one side only.

A paring chisel is the very finest chisel made. It is long, thin and made of fine steel. A paring chisel should have an octagon handle, long and true, and should be put on in perfect line with the blade of the chisel.

Paring chisels, as the name indicates, are used for "paring or cutting any superfluous stuff on fine work."

A mortise chisel is a thick, heavy tool, made of iron, faced with steel. Generally there is a socket to receive the handle. Sometimes the top end of the handle is inclosed in an iron ring, placed there to resist the force of the mallet used in "driving" a mortise.

A firmer chisel is one midway between a mortise and a paring chisel. It is the most useful for amateurs, as it can be used for mortising and paring. They are pretty strong, and generally have turned handles with brass ferrules. For general work they should not be ground too thin, for if they are finely tempered they will break when used for mortising, and if used for paring they will answer very well if ground medium in thickness.

If we were asked how many chisels an amateur should want, who did not have "money enough" to get complete sets of the three kinds, we should say: For paring chisels, get one 2-inch, one 1½-inch and one ½-inch; for firmer chisels, get one 1¼, one 1½ and one ¾; for mortise chisels, get one ¼-inch, one ⅜ and one ½-inch. These will give the amateur a fair supply and give him all he wants for general amateur work.

Gouges are not so much in request by amateurs; sometimes, however, work cannot be done without them. It is generally the best policy for an amateur to buy gouges only as he wants them. The style of gouges is unaccountable; every curve requires a different set of gouges. When you want a gouge, get the curve, take it to a dealer, and get a tool to suit.—*Manufacturer and Builder.*

A KINK IN HAND SAWS.—A correspondent of the *American Machinist* says: Hand-saws are usually hung up by the handle, involving a very awkward operation every time they are taken for use or replaced on the pin. It usually requires both hands to go through this performance, so common to every woodworker that its awkwardness is not appreciated, and will not be until he has his saws intelligently hung up by the point, with the handle within reach. Then he will wonder why he didn't have that hole drilled in the point long ago. By the way, drilling that hole is the only difficulty in the matter, but any machinist knows how to drill a saw of ordinary temper. Don't be contented with a small hole, but make it $\frac{5}{8}$" or $\frac{3}{4}$", although the machinist will doubtless drill a small hole first. When you have your saws thus properly suspended, you will hang them up a dozen times a day where you now lay them down for a few minutes until you want them again. Besides, this method has decided advantages to the saw itself. Its handle is not scratched and marred by being constantly placed and replaced on a rough nail or screw, and its blade is not corroded by the sweaty hands of the workman, as is necessarily the case in the old way. It would be a decided boon to wood workmen if sawmakers could be induced to put this hole in the saws when they are made, and the writer hopes that the publication of this may tend to that result.

THE SQUARE HOLE AUGER.—They have in London a "Square Drill Syndicate" organized, as we are informed, to make and sell drills to make "square holes" in metal. What is to be done with the "holes" we are not informed, but will suggest that some of them be put on the market before too much investment is made in the drills. We have our modern methods of construction adapted to round holes, which seem to answer very well, and the few that require to be square are made at less cost than the maintenance of complicated "square drills" would amount to. In wood the case is different; wood is a laminated material with little strength except across its fiber, hence holes and mortises should be oblong whenever possible and can be so made by simple implements. The metal Cotter machines for making oblong holes have never come into general use, and a square drill has a still less promise of success.—*Industry.*

SPARKS FROM BELTS.—An interesting note from a correspondent of the *Electrical World* says: Some time since there was trouble with one of the arc machines in use, and after a careful investigation by Mr. Pierce, the electrician who kindly furnishes the facts, it was found that the static discharge from a belt to the frame, and thence to the armature, perforated the insulation so that the machine current had followed it and burned out the armature coil. The trouble once found, a very simple and effective remedy was employed. Grounded rods were bent from the pulleys so as to take the static discharge from the bolt. It is well known that quite a powerful spark can be obtained from belts under certain circumstances, but this is a remarkable instance of its effect.

USEFUL INFORMATION.

THE KEROSENE LAMP AND ITS DEFECTS.—The frequent accidents that occur in the explosions of kerosene lamps furnish strong evidence that there is something wrong in their construction. A gentleman who is engaged in the business of selling kerosene lamps and oil stoves writes to the *Scientific American* as follows: "The present system of burning oil, both in lamps and oil stoves, seems like a satire upon this progressive age. A flame oxygenated by air currents to the fiercest heat is placed directly in contact with a brass tube through which all the oil consumed has to pass. Of course this tube, being always made of brass, is one of the most rapid conductors of heat, and soon becomes excessively hot. A better device for generating explosive gas could hardly be conceived. The worst of it is that the gas thus rapidly generated falls into the oil font and is all ready for an explosion the moment that the smallest part of it comes in contact with fire. A slight current of air will often convey some of this gas to the flame, when the conflagration or explosion is almost sure to follow. If some of our inventors would substitute some device for the present mechanical and scientific outrage, something not too complicated and expensive, I risk nothing in asserting that such a device, if brought before the public in a business way, would become universal. The horrors referred to have now become so frequent that they receive only a brief and passing notice in the daily papers."

HOW TO WATER PLANTS IN POTS.—Success or failure in the growing of house plants is largely due to the care and attention paid to watering. Like everything else, what is worth doing is worth doing well. When plants require water, give it unsparingly. The system to adopt is to be thorough rather than regular. Many persons water their plants as regularly as they wash their faces, which will not do. A plant should not be watered unless it needs it, and it does not need it so long as the soil contains sufficient moisture for the plant's use; more than that is an injury. Water should never be given until the plants show by the drooping of the leaves that they need it. Then give with a liberal hand, not simply a surface wetting, but give until every particle of soil in the pot is wet; let it go to the bottom. Many plants have been so long potted that the ball of roots and earth is almost impervious to water. Water applied to such, ten times a day, will do but little good; the pots should be put in a tub of water occasionally, and left there for 24 hours, the pot all under water, then they will get a wetting that is useful and lasting.—*Agriculturist.*

PROTECTION OF MINE TIMBERS FROM DECAY. The German government mine Altenwald, near Saarbrucken, has, since 1888, conducted a series of experiments to ascertain the most effective means to prevent from decaying the pine timbering, which is subject to great pressure in the airways. Lime, coal tar, tar and carbolineum were tried in such a manner as to enable a comparison of their relative protective value. The results as published in *Ztsch. f. d. Berg, Hutten u. Salinenwesen* show lime to be the weakest. Coal tar preserved the outside of the timber, while the core was found completely decayed. Carbolineum proved by far the best, and is now being used on all the timbering of the upcast in that mine. The mine timbers, made of wood peeled and dried, are twice painted over with the carbolineum above ground and require each, when 2.5 meters long and 0.25 meter in diameter, in the first application 4.5 kilogramme and in the second 3.5 kilogramme, so that, at a price of 34.5 pf. per one kilogramme, the total cost was: For material 48.3 pf. and for labor 14 pf., or altogether about $0.15.

HOW TO DESTROY GERMS IN WATER.—Dr. C. G. Currier says, in the *Medical Record*, that water is easily sterilized by keeping it at or near the boiling point for 15 minutes. Five minutes' heat is sufficient to destroy all harmful micro-organisms. Still less time suffices to destroy the disease-producing varieties which are recognized as liable to occur in water. Thus merely raising to the boiling point a clear water containing the micro-organisms of malarial disorders, typhoid, cholera, diphtheria, or of suppurative processes, and allowing it to gradually cool, insures the destruction of these germs. They are also destroyed by keeping the water for from a quarter to half an hour at a temperature of 170° C. Occasionally, however, very resistant but harmless bacteria may get into water. The brief heating renders them safe for eating purposes; but when it is desired to destroy every micro-organism that may be present in a contaminated water, it should be heated for one hour and allowed to cool slowly. It may then be used for cleansing wounds, or for alkaloidal solutions, which will keep indefinitely if no germs be introduced after the solution has been heated.

PAINT SPOTS may be removed from wood by covering them with a thick coating of lime and soda. Wash off after 24 hours.

Passing Events.

The two legal holidays have broken into the business week, and the city has been filled as it never was before with visitors from the interior. The 40th anniversary of the admission of California into the Union was splendidly celebrated by the Native Sons of the Golden West and the Pioneers, one of the main features being the largest procession ever seen on the Pacific Coast. The immense crowds were well behaved, and there were no accidents to mar the pleasure of the celebration.

Considerable interest is manifested in the probable result of the suit of the Mining Stock Association against the Hale and Norcross Mining Company directors for restitution of moneys alleged to have been wrongfully diverted from the company. If these directors are proved to have acted unlawfully, the directors of other Comstock companies will doubtless be called to account in a similar manner.

The molders' strike in the foundries continues as for some months past. The union men are still out, though the shops are running with non-union men from the East.

COAL AND GOLD IN ALASKA.—The Alaska Commercial Co. is developing both gold and coal on Unga island, and about 100 men are at work. Next season a still larger force will be employed.

Failure of the Silver Bill.

If there is anything lacking to convince the most skeptical that the Silver bill is a wolf in sheep's clothing, it is found in the speculative movements of the metal. From 92 cents the price was advanced (under the belief that a silver bill would be passed by Congress) to about a dollar an ounce. After the law went into effect, under steady buying by the Treasury Department at Washington, the price at one time reached $1.20¾ an ounce, but it fell with smaller purchases to below $1.17 an ounce.

These movements are unmistakable evidences that the bill does not meet expectations and was another bold attempt to demoralize silver, for, while pretending to make it the basis for the circulation of silver certificates, in reality the law places the entire control of the currency, as before, in the hands of one man, the Secretary of the Treasury.

There is no denying the fact that a large majority of the citizens of the United States want a stable currency, one based on bimetallism, and that a more determined move will be made to its acquirement by remonetizing silver. What they demand, as expressed through their various organizations, and what they intend to have, is the full, free and unlimited coinage of silver into money bearing the stamp of the Government and placed in actual circulation. They, so far as we can ascertain by our exchanges, have no objection to silver certificates to be used in handling as a substitute for the silver, but they want the silver first coined and placed beyond the reach of Wall street and the National banks.

No fears need be entertained that by free coinage this country will be made the dumping-ground for other countries, for events of the past month prove the contrary. Writing to the Manchester *Guardian* on the silver question, a leading European authority, Sir Morton Frewin, has the following to say on this particular point:

The silver market will be very bare of supplies after Christmas, so that before the next session of Congress is half through the United States par of exchange (1 to 16) will have been restored and the rupee will be at 22 pence. There will then be a proposal, supported by both political parties, that the United States shall join the monetary league of the Latin Union with mints open at 1 to 15½. We shall then have entered upon this currency phase. Any 15½ ounces of silver coined at Washington will enable the holder to draw an ounce of gold from the Bank of England, the bank being powerless to protect its reserves. The operation will be conducted on these lines. I take silver to the United States mint, which is coined freely, and returned to me, if I prefer, in the shape of notes. These notes I deposit in my bank in New York, and I proceed to invest my bank balance in the purchase of New York Central Railway bonds. These bonds I sell by cable in London for gold; so that just as long as any European investor will buy American securities every 15½ ounces of silver will be available to draw an ounce of gold from the Bank of England, the bank having no discretionary power to refuse to pay gold.

The Mechanics' Fair.

Now that the Native Sons have got through with the Pavilion, the Mechanics' Institute again has possession, and during the latter part of this week has been putting it in order for the coming fair. The big building will be all ready on Monday to receive articles intended for the exhibition. As the time is short, all intending exhibitors should be promptly on hand to arrange their displays. It is to be hoped there will be no delay on their part, so that the superintendent and those who assist him will not be so rushed on the day or two preceding the opening of the fair.

Although the use of the Pavilion by the Native Sons in celebrating the 40th Anniversary of the Admission of California into the Union has delayed matters connected with the fair to some extent, there is time enough to arrange all the displays, provided the exhibitors set right at work. Supt. Culver has everything prepared for them as far as lies in his power. It is the intention this year to have the fair exceed in interest any that has preceded it. A number of special features are promised, and as for once it does not come at the same time as the State Fair, a very large attendance is expected. As the industries of this State are being rapidly extended from year to year, there should be a larger representation than we have ever had. The Mechanics' Fair is not a local one merely, but aims to represent the interests of the State at large as well as the city.

Comstock Mine Management.

On last Saturday, M. W. Fox, Chairman of the Executive Committee of the Mining Stock Association, through his attorney, W. T. Baggett, filed a suit in the Superior Court for the recovery of $2,250,000, which he alleges has been misappropriated and which he claims rightfully belongs to the stockholders of the Hale & Norcross mine. The suit is entitled M. W. Fox, plaintiff, vs. the Hale & Norcross Silver Mining Company (a corporation), C. F. Bridge, M. Hoeflich, H. M. Levy, W. E. Sell, Jos. W. Souther, W. C. Watson, Chas. P. Egan, A. K. P. Harmon, Jos. Marks, Chas. S. Wheeler, E B. Holmes, J. B. Low, Richard Roe, John Doe, James Black, John White, Daniel Bline, defendants.

The bringing of this suit will undoubtedly throw much light, through official investigation, into the subject of mining and milling Comstock ore.

Based upon statements heretofore published by the MINING AND SCIENTIFIC PRESS, the Mining Stock Association has been assiduously at work in gathering facts and figures upon which to ground their suit, and, so far as we can learn, with better results than the leading men of the organization had dared to expect. But there is yet considerable to do in the compilation of the information already gained, besides the securing of much more which they are in reasonable hopes of getting. Within the past week they have received from the Carson Mint official data by which it is claimed they can trace all the bullion alleged to have been taken to the Mint at unseasonable hours and sold, the proceeds from which they claim have been misappropriated. This, it is needless to say, is an important link in the evidence required to substantiate the charge that the Hale and Norcross mine has not been managed in the interest of stockholders.

The making of each and all of the directors of the company defendants in the suit brought by Mr. Fox, is done looking to the securing of the rights of stockholders in the event of the court deciding in favor of the plaintiff.

Some of the directors are reputed to be wealthy, and in accepting the office of trust they made themselves responsible for the management of the company's affairs in the interest of each and every stockholder. Assuming this position, they are pecuniarily liable for all funds, bullion, etc., misappropriated, not to call it by a harder name, and they can by law be compelled to make good the amounts wrongfully taken, and if collusion can be proven they are liable to criminal prosecution.

If the Carson mint records show what it is claimed they do, then the United States Government must, in duty bound, take cognizance of the fact and institute a thorough investigation, besides bringing suits in the courts against the mint officers said to be guilty of collusion with those who have sold bullion taken to the mint between two days, the proceeds from which were diverted from the stockholders, to whom it rightfully belongs.

In this connection, it may not be out of place to state that the publicity given to the way Comstock ores are milled, is bringing in inquiries from leading lawyers at the East, asking for fuller information and all the data obtainable on the subject. This they are doing in the interest of Eastern stockholders, many of whom are reputed to hold large lines of Comstock mining shares. It is shrewdly surmised that these inquiries are instituted with the view of bringing suit in the United States Circuit Courts at the East against the officers or managers of one or more of the Comstock mines.

THE Secretary of the Treasury, after a consultation with the Director of the Mint, decided that he will purchase under the new law 7,280,000 ounces of silver between August 13th and September 30th, so as to start on October 1st with a purchase of 4,500,000 ounces per month. Purchases to date make a total of 4,500,859 ounces since the law went into effect.

Northern Pacific Mineral Land.

U. S. Senator Morgan has introduced a resolution directing the Senate committees on the Land Grant Forfeiture bill to insist that all mineral lands granted to the Northern Pacific, except coal and iron lands, be disposed of under the mining laws, the same as if they were a part of the public domain. Whenever the Northern Pacific shall relinquish its title to any of these mineral lands, it shall receive in lieu thereof an equal amount of agricultural or timber lands. The conferees are instructed further to insist upon a provision declaring that the United States retains the right to amend the Act or to hereafter declare further forfeiture of Northern Pacific lands. He also introduced a resolution calling upon the Secretary of the Interior for full information respecting the number of suits between the settlers and the Northern Pacific, the proceedings taken in them, whether the railroad company has changed the location of any part of its roads, whether lands were reserved along the line of this new section of road, and whether any part of the road was definitely located within the time fixed in the charter.

This is an excellent step. The miners of Montana particularly were in danger of losing valuable mineral lands by the claims of the railroad company. The subject has been agitated for the past year or two, and the miners banded together to bring the matter to the attention of Congress. It seems they have succeeded, and now that official attention has been called to the subject, it is not probable that the railroad company will get this mineral land. Congress never intended it should in the first place, but the company has claimed everything in sight. Could they verify these claims, an immense extent of public mineral land would come into their possession, and the prospector's range become proportionately narrowed.

The Admission-Day Celebration.

The Native Sons of the Golden West who took charge of the celebration of the 40th anniversary of the admission of California into the Union may congratulate themselves on having arranged and carried out the most successful affair of the kind which ever took place in this State. For nearly a week the city has been in holiday attire and has been thronged with visitors from all parts of the State. It is conceded that there never were, in one day, so many people in San Francisco as on the 9th, the day of the procession. The transportation companies, although prepared for a crowd, found their facilities taxed to the utmost. The regattas, procession, receptions, fireworks, ball, bay excursion and all festivities passed off with great success and no accident.

The procession was the main feature of the celebration, and was the largest ever seen on this coast. All sorts of things reminiscent of pioneer days in California were represented, the early mining features being specially prominent. The different Pioneer societies joined with the Native Sons in making the affair a success, and the citizens and visitors were in good-natured accord with the whole celebration.

SAN DIEGO SALT.—The San Diego *Union* says that the output of the La Punta Salt Works, below the city, on the bay front, is expected to amount to 10,000 tons this fall, instead of the usual average of 600 or 700 tons. Eugene E. Shaffer, who has conducted the works for the past eight years, was in the city yesterday. He said that they were just now in the midst of their producing season, and would harvest by about November 1st. Instead of depending upon the high tides to fill their 40 acres of ponds, which a dam protects, they have put in this summer a steam pump, which brings the salt water from the bay to the vats.

THE Virginia *Chronicle* says that the Comstock mines generally are looking well, with plenty of ore in sight and ample milling facilities, which could not by any means be said at this time last year.

EIGHTY carloads of chrome have been shipped this season from near Red Bluff to Philadelphia. The mine is 25 miles west of Red Bluff.

DANIEL STREETER of Biggs, Butte county, has gone to Eugene City, Oregon, to open a coal mine near the latter place.

Quicksilver.

In another column of the PRESS is given an abstract of a census bulletin on the quicksilver mines of the United States. In fact, all the quicksilver mines of the United States are in California, with the exception of one or two unimportant ones in Oregon. The 11 productive mines of the country are in this State. The six unproductive mines are those the stoppage of which was caused by litigation, by low prices of product or by lack of sufficient capital and experience to pursue a hazardous industry. It is considered probable that all of those establishments now closed and unproductive will resume work when higher prices for quicksilver can be obtained.

The producing mines of this State employ 937 operatives, and last year produced 95,714 tons of quicksilver ore of an average of 1.088 per cent, producing 26,464 flasks of mercury worth $1,190,500.

The earliest records relating to production of quicksilver in California are for 1850, cinnabar having been first discovered there in 1845, and but very little quicksilver was produced prior to 1850, when active work was commenced at New Almaden. Outside of California, quicksilver has been produced in two localities in the United States—in Oregon to the extent of 2000 flasks, and in Utah, where about 200 flasks were reported. In the last ten years all the mines of the United States have produced 407,675 flasks; the Spanish, Austrian and Italian mines in the same period have produced 685,930 flasks, of which 483,939 flasks were from the Spanish Almaden mine. The grand total production of the quicksilver mines for the past ten years was 1,093,611 flasks. In the last 10 years California's quicksilver product aggregates in value the sum of $13,258,000. This State's product from 1850 until this year was valued at $69,258,000.

LAND TROUBLES. — Placerville *Republican*, Sept. 4: The United States Circuit Court some time ago rendered a decision affecting the title to all lands in the odd sections granted to the Central Pacific Railroad Co. which had been obtained under mining applications from the Government subsequent to the grant. The effect of the decision was to confirm to the railroad company all lands in the grant, whether mineral or agricultural, from the time the grant was made, and to vitiate the title of lands held under mineral patents. Following this decision, the railroad company has notified owners of such land, a number of whom reside in this county, that suit will be commenced against them to recover the land which the company claims under the grant from the Government.

Oregon Scenery.

The beauty of the Northwest is the theme upon which every visitor delights to descant. It is of a type wholly different from that of California, and it is conceded, we believe, to be far more grateful to the eye. The whole Pacific Coast is, however, so well endowed with Nature's best work that comparisons are needless—each has enough to stimulate and ennoble all who attune their hearts to Nature's sublime lessons.

The Northwest has many scenic features, but the scenery of the Columbia has commanded the greatest effort from poet and painter, and it is indeed grand and entrancing. Our photo-plate gives a glimpse of a beautiful scene in the palisades. Of the scenery of the Columbia an admiring local writer has penned these words:

The Columbia river passes through a country which, among other features, affords the grandest and most picturesque of scenery. Tourists who have traveled in many countries pronounce the ride up the Columbia from Portland the finest within the range of their experience, and even declare the scenery to be the most magnificent along any river on the globe. The Columbia receives its large tributaries, with the exception of the Willamette, before breaking through the Cascade mountains. The whole course of the Lower and Middle Columbia is through a mountainous country. The towering rocks, abysmal chasms, wooded cliffs, gloomy caverns, cascades and cataracts are made familiar to the voyager on the Columbia, who can spend any time he chooses at specially interesting points along the shores.

The palisades of the Hudson, the pictured rocks of Superior, the rugged crags of the Alps, the picturesqueness of the Rhine, the deep wilderness of the Amazon, combine on the banks of the Columbia to make a continuous scene of rare beauty and sublime grandeur. The steamers, which ply regularly on the river, carry thousands of delighted tourists annually through this American wonderland, any attempt to describe which only makes evident the poverty of language.

The Gold Belt of California.

Ancient River Channels and Gravel Deposits.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON of Kernville, Cal.]

I have been very much charmed by the articles from the pens of H. G. Hanks and J. F. Talbott on the ancient placer deposits of California. Mr. Hanks appears as an honest inquirer searching for truth, fearless of the established dictum of scientific lore. Mr. Talbott appears as a plain and unpretending miner, who has the modest courage to give his observations to the world and the reasoning fairly deducible therefrom. Both writers have done much to awaken an interest in gravel mining.

The subject was well worthy all the investigation Mr. Hanks was able to give as to whether glacial deposits ever present the phenomena of a continuous flow of water-worn gravel, or whether much of it presents the appearance of fragmentary rocks set in sockets of ice while one side was being planed down. There are several objections to the theory of a glacial deposit suggested by my observation. The first of these objections is that the flower which adorned the banks of these ancient streams was the same as that met with in California to-day. The manzanita, the alder, the yellow pine and the black oak, flourished upon their banks, formed drifts upon the pay gravel and were afterward covered with cement, which in its turn was covered with a lava flow. I have followed the track of some of the most noted ancient glaciers ever known to have had an existence in California, and have found no moraine clearly glacial in character extending below an altitude of 7000 feet above the level of the sea.

A second objection to the glacial theory is that the gold is generally deposited on about the same slope of bedrock met with in the rivers or in an artificial ground-sluice which is run partly bare.

A third objection to this theory is that after the lava flow—after the bed of the stream had been raised 200 feet above the bedrock—and before the stream had cut a new channel in softer ground, some of the lateral tributaries continued to send down auriferous gravels and deposit them on top of the lava, showing that placer gold came from the country traversed by the lava flow, instead of being transported an interminable distance by a glacier.

But it seems to me that if the first objection can be sustained, then the glacial theory must fall. We must appeal, then, to the observations of the thousands of truthful and energetic men who set commerce in motion by tearing down the ancient hills. Beneath Cedar hill, just south of the village of Placerville, in El Dorado county, an immense amount of timber was found lodged on the gravel, and generally of the varieties I have mentioned. This hill was capped with what would be termed brecciated lava. This form of lava is most common in the central portion of the mines, and was evidently formed by a crust forming on the surface of the stream and then breaking into fragments and partially sinking in the half-congealed mass. At Gold Hill, just west of Columbia, Tuolumne county, where only the cement and gravel were left, trees of valley oak and yellow pine were unearthed, also at the Buchanan tunnel beneath Table mountain, a mile and a half northwest of Columbia. In a channel known as the Fox Head, rising in the flat one mile west of Columbia and descending to the southwest beneath Table mountain, alder and manzanita leaves were found. But it is useless to enlarge on this branch of the subject. The banks of the ancient rivers were clad with a verdure semi-tropical in its nature, and for millions of years after the rivers had sought their present beds the mastodon maximus found a favorite resort in the placer mines of Tuolumne.

During all these centuries this huge animal and the Indian evidently watered at the same spring, and up into the post-pliocene age the bones of the mammoth were buried beneath calcareous tufa on the same bedrock where the Indian woman had ground her acorns.

Scientists are too apt to hurry up nature by the employment of cataclysms. Time will plow out the channels, and mathematics will give the time, without betraying the age of the world.

Mr. Talbott mentions the fact that two of these ancient channels evidently descend from the same source. This would be pretty good evidence that the stream was nearing its delta, and as a corollary, that it met the ocean at a higher level than now. My observations have tended to the conviction that there have been two periods of volcanic activity in the region of the placer mines, and that during the first of these periods the rivers met the ocean at an altitude of 2000 feet above their present level. I think it susceptible of geological demonstration, that after volcanic action had ceased on the western slope of the Sierra Nevada mountains, Kern river met the ocean 1200 feet above the Tulare valley.

VIEW IN THE PALISADES ON THE COLUMBIA RIVER.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

BACON LAND AND IMPROVEMENT CO., Aug. 25 (Oakland). Capital stock, $300,000. Directors—H. D. Bacon, F. P. Bacon, F. S. Page, C. H. Berlin and F. A. Berlin.

DENBORN CO., Aug. 25. Object, publishing, mining and commercial business. Capital stock, $100,000. Directors — Richard Stevenson, Henry A. Cummings, George F. Richardson, James Horsburgh, Jr., William Sproule, J. Otto Heppner, William C. Brown.

PACIFIC WERNSTROM ELECTRIC R. R. CO., Aug. 25. Capital stock, $20,000. Directors—Dwight E. Ryland, C. T. Ryland Jr., H. T. Scott, John T. Scott, D. I. Mahoney.

MODESTO LUMBER CO., Aug. 26. Capital stock, $40,000. Directors—Austin D. Moore, John R. Hanify, Alonzo M. Green, John R. Jarboe and George W. Bates.

BRAZILIAN MAN'F G CO., Aug. 27. Capital stock, $500,000. Directors—J. C. Bates, M. C. Walton, P. A. Campbell, J. F. Davis and A. Walrath.

LOS ANGELES CONSTRUCTION CO., Sept. 2. Capital stock, $1,000,000. Directors—G. H. Bradshaw, A. D. Brock, G. F. Barnwell, R. A. Friedrich and F. E. Birge.

SAN FRANCISCO FRUIT & WINE CO., Sept. 2. Capital stock, $200,000. Directors—J. H. Wilson, D. Hay, W. H. Hay, W. M. English and I. M. Hay.

HALL MANUFACTURING CO., Sept. 3. Object, manufacturing "Hall's Antiseptic Salve." Capital stock, $100,000. Directors—W. R. Hall, L. E. Mitchell, A. E. Potter, A. O. Colton, E. W. Haines, J. N. E. Wilson and E. J. Mott.

KERN COUNTY LAND CO., Sept. 3. Capital stock, $1,000,000. Directors—Lloyd Tevis, J. B. Haggin, I. C. Stump, Will S. Tevis, W. F. Goad and Henry Wadsworth.

KERN COUNTY CANAL & WATER CO., Sept. 3. Capital stock, $5,000,000. Directors—Lloyd Tevis, J. B. Haggin, I. C. Stump, Will S. Tevis, W. F. Goad and Henry Wadsworth.

LOW COST OF MILLING.—The Amador *Ledger* says that Tripp's claim on the Mokelumne mines, hauls and mills its ore for 61 cents per ton. The El Dorado *Republican* says the Dalmatia mine near Kelsey, in that county, is mining and milling by electricity at a cost of 42 cents per ton. These examples beat the Spanish mine in Washington township, Nevada county.

THE Risdon Iron & Locomotive Works of this city have on hand 12 Frue concentrators, which, though in first-class order, will be sold for a low price.

Founded by Mathew Carey, 1785.

Mining Share Market.

On Thursday, Friday and Saturday the mining share market was lifeless at blackboard quotations. Monday and Tuesday being legal holidays, the two exchanges were closed. On Wednesday, the market opened with considerable life and strength, particularly in Potosi and Challenge, both scoring a 15 per cent advance. In outside shares there was no trading in the Tuscaroras and very little in the Bodies and Quijotoas.

The situation warrants much better prices for the Comstocks, provided confidence was felt that the mines were being honestly worked; but even as it is, higher prices are likely to obtain. This opinion is grounded upon the well-established fact that insiders have been steady buyers of stocks for some time past, and consequently they have considerable cheap bought stocks which will net a good profit at a higher range of value, and better prices can be obtained in two ways—one by cross-orders on the up grade and the other by a few cross-orders on either a showing or talk of ore development. This was lately done in Potosi and Bullion. Insiders can show up rich ore at any time desired, but whether it is policy or not is questionable, except to sell stocks at good prices, for under the present method of milling, the bullion can be spirited away and no questions asked.

News from the Comstock mines is of an important charac er. Active prospecting work is under way from Caledonia in the south to Scorpion in the north. There is every encouragement of important developments soon. Failing in this, insiders should show up that ore body going over $60 a ton that was discovered several months ago in one of the Gold Hill mines, and which at the time we published officially. They should also show up the rich ore lying to the west in Hale & Norcross. It now looks as if the insiders are going to show up that ore on the 1750-foot level in Con. Virginia, at least more active work has been inaugurated on that level. Miners are watching with renewed interest the work going on in Ophir, Union, Sierra Nevada, Chollar and the Gold Hill mines. A well-informed person says that ore from Seg. Belcher is being hoisted through the Overman shaft. It is stated that the pumps will be started next month. It will not take long after starting up to drain the Gold Hill and Alta group of mines. The superintendent of Kentuck is very confident of finding an ore body in that mine, lying over 100 feet west of west ledge. The ground improves as work progresses.

From the outside mines the news from the Tuscaroras and Quijotoas is very favorable. From the Bodies our advices report all work in Mono suspended. In Bodie they are sinking a winze below the 700-foot level. The news from the mine is growing more important and deserves close watching.

Sales at San Francisco Stock Exchange.

Assessment Notices.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of August, 1890, an assessment, No. 19, of six (6) cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of September, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of October, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.
Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4,000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. Willis E. Everette, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MFG CO., 9 Nassau Street, Rockford, Illinois.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

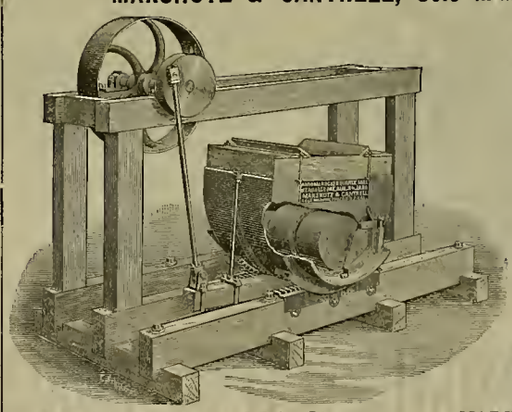
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

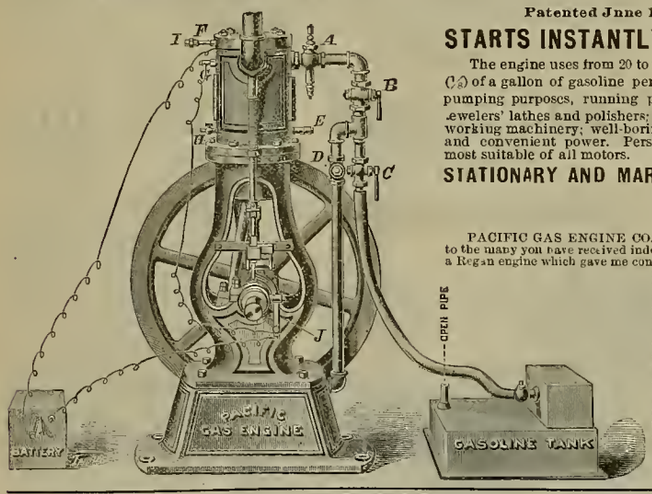
Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

THE PACIFIC GAS OR GASOLINE ENGINE.

Patented June 17, 1890—Nos. 430,504, 430,505, 430,506. Also in Great Britain and other foreign countries.



STARTS INSTANTLY WITHOUT THE NECESSITY OF BOILER, FIRE OR EXPERIENCED ENGINEER.

The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth (⅛) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED, and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY AND MARINE ENGINES FROM 3-4 TO 15-HORSE POWER. OVER 100 IN ACTUAL OPERATION.

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890.

PACIFIC GAS ENGINE CO.—GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, mine was a Regan engine which gave me considerable trouble. I had to remove the head and raise the tappet valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliances, head, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head from any cause since you made the change (over two months). It gives me no trouble; my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective and cheap.

Respectfully yours,
E. S. HILL.
Cor. Encinal Ave. and Morton St.

U. S. MARINE HOSPITAL SERVICE, DISTRICT OF THE PACIFIC.
SURGEON'S OFFICE, PORT OF SAN FRANCISCO, Feb. 1st, 1890.

TO THE PACIFIC GAS ENGINE CO.—GENTLEMEN: In answer to your letter of inquiry, of the 23d ultimo, relative to the working of the two-horse power vapor gas engine, recently set up by you at the U. S. Marine Hospital, Monuta'n Lake, near the City of San Francisco, Cal., I have to say that, up to oat', the engine has given entire satisfaction, developing the power required in the specifications: of "raising 20,000 to 30,000 gallons of water 100 feet high through 600 feet of two-inch iron pipe, to tanks on the hill, in 24 hours." It is more economical than steam, requires less attenti n, and can be set in operation at a moment's notice.

If it continues to do its work as satisfactory as it has done since December 22 1889, when placed in operation, it may be pronounced a perfect success.

Very respectfully,
PRESTON H. BAILHACHE,
Surgeon U. S. Marine Hospital Service, Custodian.

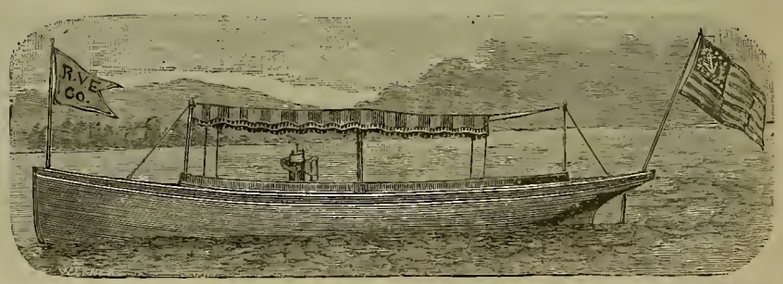
GEORGE HAAS, 824 Market St., Phelan Building, } SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do s my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.

Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co, Racine, Wis.

Manufacturers of NEW and Dealers in SECOND-HAND BOILERS, ENGINES, PUMPS and MACHINERY

OF EVERY VARIETY.

Steam Pumps of all Makes,

CENTRIFUGAL PUMPS,

MINING PUMPS.

BLOWERS AND EXHAUST FANS.

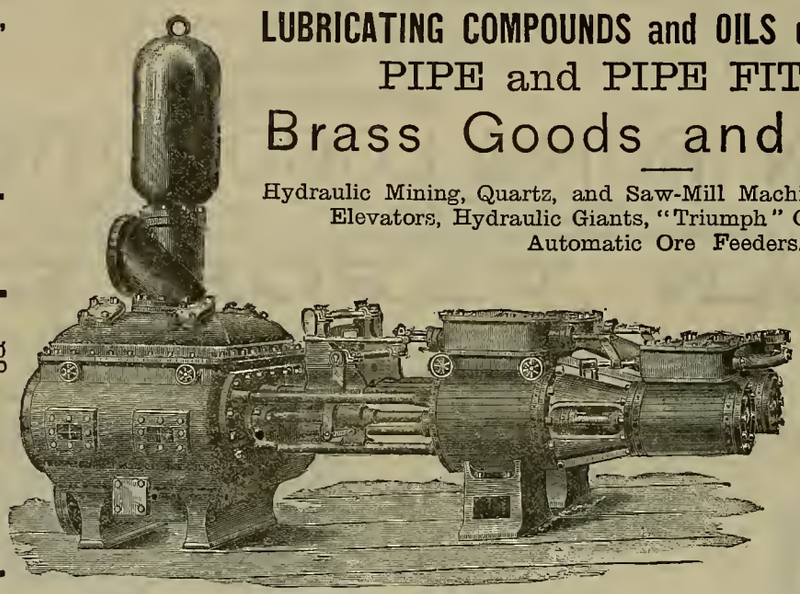
LEATHER and RUBBER

BELTING.

Stationary, Portable, and Hoisting

ENGINES and BOILERS.

Shafting,
Pulleys,
Boxes,
Hangers.



COMPOUND DUPLEX PUMP.

LUBRICATING COMPOUNDS and OILS of the Best Makes.

PIPE and PIPE FITTINGS.

Brass Goods and Fittings.

Hydraulic Mining, Quartz, and Saw-Mill Machinery, Hydraulic Gravel Elevators, Hydraulic Giants, "Triumph" Ore Concentrators, Automatic Ore Feeders.

WOODWORKING MACHINERY

—COMPRISING—

Band Saws, Stickers,

Planers, Shapers,

SHINGLE MILLS, Etc.

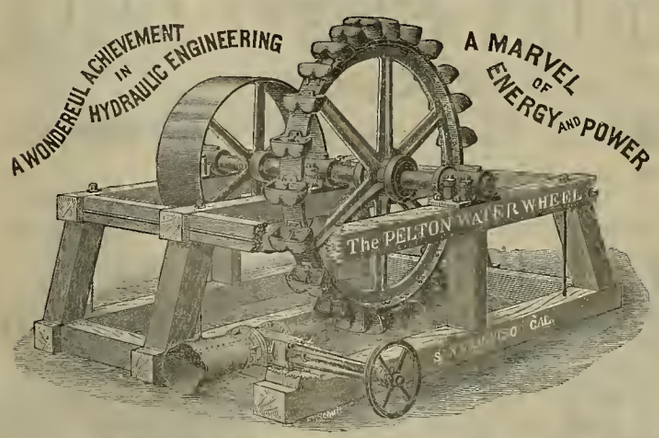
IMPROVED SINGLE AND DOUBLE CIRCULAR SAW-MILLS.

AGENTS FOR THE SALE OF

"Eclipss Corliss" Enginss, "Russsll" Automatic Enginss, "Climax" Band Saw-Mills, "Economizsr" Boilsrs and Enginss, "Eris Engins Works" Boilsrs and Enginss, Trsnton Iron Works Spscialtiss of Wirs Ropes, Garlock's Elastic Spiral Packing, "Baksr" Rotary Prsssurs Blowsrs, Rotary and Centrifugal Pumps, Buffalo Duplsx Stsam Pumps, Exhaust Steam Injsctors, Automatic Rs-Starting Injectors, Machinists' Tools of all Styles for all Work.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.



A WONDERFUL ACHIEVEMENT IN HYDRAULIC ENGINEERING
A MARVEL OF ENERGY AND POWER
The PELTON WATER WHEEL
SAN FRANCISCO CAL.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

THE GATES

ORE AND ROCK CRUSHER

—IS—

THE MOST IMPORTANT IMPROVEMENT

That Has Ever Been Made in This Class of Machinery.

IT WILL DO MUCH FINER WORK

Than Any Other,

AND AT ONE-HALF THE COST IN WEAR.

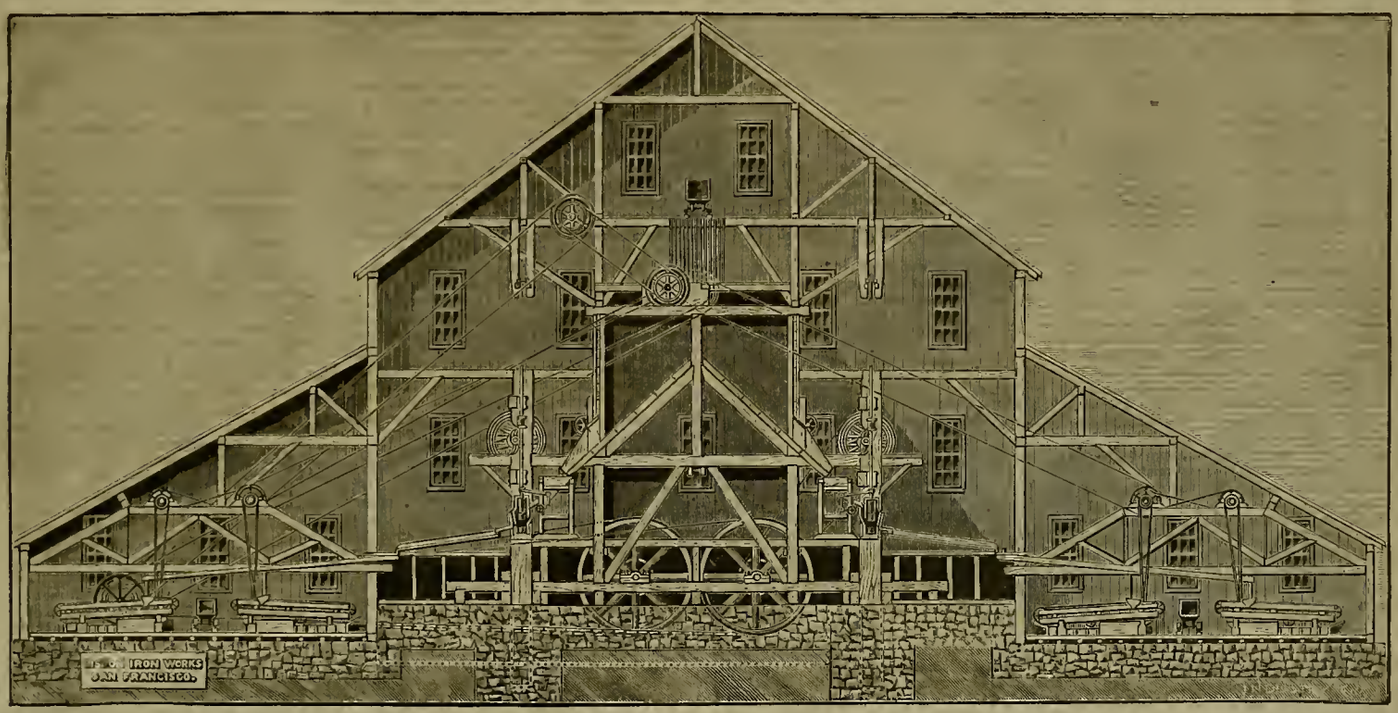
Single Copies, 10 Cts.



THE 240-STAMP MILL OF THE ALASKA MILL AND MINING CO., DOUGLAS ISLAND, ALASKA.

Marshall's Window-Sash Balance.

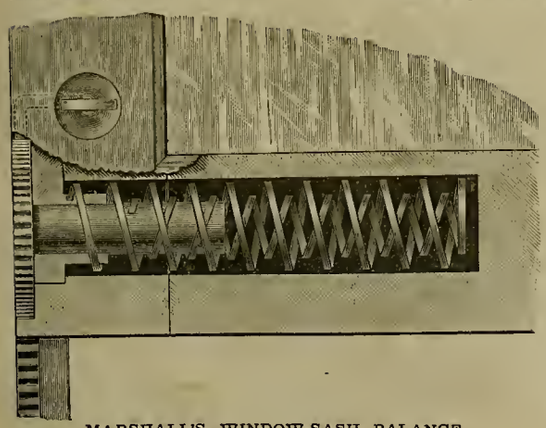
The device herewith illustrated was invented by Dr. Benjamin Marshall of San Francisco, and is designed to take the place of the present cumbersome window furniture, doing away with the boxes in the sash, the weights, cords and pulleys, and also the lock at the meeting rails. It is as much superior to the old-fashioned furniture as the Hartshorn shade-roller is superior to the cord-pulley of other days.

The operation of the device is due to the reciprocal action of the spring and pinion, the latter of which, engaging the rack and rotating as the sash is moved down, effects the winding up of the spring, and the spring thus wound serves to rotate the pinion when the sash is moved up, the whole thereby performing its function of a sash balance.

The device has been in active use over Dr. Marshall's entire house for a year past, and works more smoothly to-day than ever. A company has been formed, called the Marshall Improved Window Furniture Co., with a capital of $1,000,000, with $250,000 paid up. A plant has been established at 126 Main street, this city, to supply California, and is now in running order and turning out about 200 complete windows per day. The device has been ordered into the new Mills building, the Crocker building and the Doe building (Hayes and Market); also into the State Insane Asylum at San Bernardino and the new courthouse in Los Angeles. Various residences now building in San Francisco and its immediate vicinity have made application for the device and will be supplied by the company to the extent of its capacity.

The beauty of this device is that it can be applied to old windows as well as new, and the company has standing orders to refurnish many old buildings

The officers of the company are: C. F. Crooker, president; C. Josselyn, vice-president; J. de W. Allen, Secretary.



MARSHALL'S WINDOW-SASH BALANCE.

THE population of the State of Colorado, according to the count of the Census Bureau, is 410,973. This is a net increase during the decade of 216,543.

The Largest Quartz-Mill.

The largest quartz-milling plant in the world is that of the Alaska M. & M. Co., Douglas Island, Alaska. It has 240 stamps of 850 pounds each, 6 rock-breakers and 96 concentrators, and is capable of reducing 600 tons of ore in 24 hours. The mill is driven by water-wheels during the wet season, and there are steam engines for use when water runs short. Each plant has 400 horse power. This mill was built by the Risdon Iron Works of this city, and was at first 120 stamps, but this number was subsequently doubled. The cut on this page shows a cross-section through the mill.

THE California World's Fair Association has been permanently organized.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Comstock Mine Management.

The Hale and Norcross Ore Assays.

EDITORS PRESS:—Toe Virginia *Chronicle* and *Territorial Enterprise* of Sept. 9th both publish articles in defense of the methods pursued on the Comstock in mining and milling.

The *Chronicle*, under the head of "Local Mining News," gives utterance to assertions that will astonish practical miners and make shareholders in Comstock mines understand that the mines in which they are interested are run for the benefit of the mills and not of the shareholders. It says, in referring to the drafting of 60 men from the Hale and Norcross mine:

"The regular prospecting development of the mine goes on energetically and is directed to searching for deposits of good ore to average up the low-grade ore with—a proposition which holds good and judicious in experienced Comstock mining."

It would seem that the gentleman who penned this paragraph made a slight mistake. He should have said that the recently published articles in reference to the management of the Hale and Norcross mine had caused the parties in charge of that property to stop their illegal practices for awhile.

This association has in its possession the official assays taken from the 800, 900, 1000, 1100 and 1200 levels of the Hale and Norcross mine, and as these assays go as high as $600 per ton and are numerous, the statement made in connection with the drafting of these men is simply nonsense.

The *Territorial Enterprise*, in its defense of the mismanagement of the Comstock mines, gets still deeper in the mire.

Their defense of the grading of ores down to a value that makes dividend-paying ore a milling proposition, and causes the levying of assessments to extract them, is the first admission ever made to stockholders that they were paying assessments for the benefit of the mill ring. If this admission was alone the truth, it is sufficient to prove the criminality of the managers of the Comstock mines; but it is not all, for it can be proven, and the proofs are in the possession of this association, that they have deliberately and continuously and feloniously made away with the bullion output from certain mines. There has never been any opposition or objection to the legitimate grading or mining of ores, but the shareholders of the Hale and Norcross object to grading high-grade dividend-paying ore down to a point where it causes a loss to the company and then levying assessments to make up the deficit. If this is not criminal mismanagement, what is?

The mine managers know that they have been guilty of the most outrageous and illegal acts possible. They know that for years they have impoverished the miners on the Comstock lode by appropriating the pay ore on which the miners on the lode have bought and held mining stocks. Their positions in the mines gave them the knowledge of important developments and the ore discovered has been spirited away under their very noses. It is farcical to see these mining managers squirming and posing as the miners' friends. They claim for themselves that by grading the ore down they have made more work for the honest miner. The fact is they fed him with a cocktail spoon with one hand and disemboweled him with the other.

Here are a few figures for the consideration of the honest miner. These figures are from the official assays of the Hale and Norcross mine, made under the direction of the superintendent in 1889:

	Cars.	Per ton
Feb. 17..	2	$ 24 30
	27	39 95
	130	44 76
" 18..	4	340 00
	31	87 31
	108	35 95
" 19..	3	208 00
	2	23 00
	38	38 84
	135	36 40
" 20..	5	224 00
	25	57 24
	125	93 00
" 21..	2	207 00
	25	42 82
	144	30 42
" 22..	5	165 00
	21	50 14
	30	29 92
" 23..	12	287 00
	30	31 12
	45	21 12
" 24..	6	212 00
	31	49 72
	112	34 89
" 25.	Assays miss ing.	
" 26..	8	240 00
	20	72 30
	58	32 34
" 27..	4	31 90
	41	27 18
" 28..	9	34 40
	53	20 39
	5	6 60

The pulp or battery assay for the week ending Feb. 18, 1889, was $21.78 per ton, and for the week ending Feb. 25, 1889, was $25.19. Deducting 30 per cent from these pulp assays gives 15.25 and 17.64 per ton respectively, or an average of $16.44 per ton, which went to the shareholders in the mine.

Can the honest miner find in the above any special evidence of grading that benefited or enriched him?

The fact is, the rock *was not* graded, and, as can be seen, very little of the metal contained in it went to the benefit or profit of the shareholders of the Hale and Norcross Company.

The Virginia papers in their various articles treat the matter of the looting of the mines with great levity. Apparently they have lived in that peculiar atmosphere so long that they are accustomed to it and can see no wrong in the acts that are considered so by others. Possibly the film may be withdrawn from their eyes in the future, and then they will see the unhappy place they occupy in the view of other men.

They seem to forget that it was the money of the shareholders on the whole Pacific Coast that developed the Comstock by continuously paying assessments through all these weary years. They seem to have forgotten that these shareholders are entitled to be considered when pay ore is found. They may have the privilege of paying assessments to find pay ore, but when found must not share it.

The Virginia City papers say that the miners are satisfied; that *they* make no complaints against the gross outrages perpetrated on the Comstock lode. This is absolutely untrue. These outrages have been continuously denounced in secret by the miners, but they know that their bread and butter and that of those dear to them is dependent upon their silence, and they put up with these wrongs and oppressions rather than make their innocent ones suffer.

What a humiliating spectacle is this exhibition of willing servility by these papers! The Czar of Russia and the King of Dahomey rule their possessions with the same gentleness that characterizes the rule of the mill ring on the Comstock, and the unfortunate miner who incurs its displeasure can get out of the camp or starve.

Perhaps the newspapers are in the same position and should not be blamed for their loyalty to the side they advocate. Yours truly.

MINING STOCK ASSOCIATION.
By J. H. TINGMAN, Vice-President.

Wonderful Trees.

EDITORS PRESS:—The subject of *wonderful trees* is an almost inexhaustible one, abounding in interest and curiosity. In our own State are found the most famous groves of gigantic trees in the world, perhaps. One who visited the Mariposa Grove last year writes: "They are not trees at first sight. You can neither measure them with your eye nor sit in their shade—only take in a portion of the brown trunk as large as a good-sized house. It is only by an unusual effort of looking up that we see either foliage or limbs. They are not beautiful—simply enormous."

Imagine one tree measuring 90 feet in circumference; this is true of "Grizzly Giant." "Wawona," sometimes called "Tunnel Tree," has a roadway cut through the solid heart which is 27 feet through, 10 feet high and 10 wide, and yet the tree is vigorous and growing. There are many others equally as wonderful in this famous California forest.

The cypress, in ancient times, was considered a sacred tree, and idols were carved from it. The Pacific Coast Indians were found using it in their ceremony of purification in their wildest savage state.

The mulberry has been called the wisest of trees from the fact that it never puts forth its buds and leaves till the season is so far advanced that there is no inclement weather to be apprehended.

Rosewood is said to owe its suggestive name to the fact that when the tree is first cut the fresh wood possesses a very powerful rose-like fragrance. There are several varieties of this wood and all very valuable.

The Quinneplac oak at Woodbridge, Conn., which was cut in 1882, was pronounced the oldest tree on the Atlantic Coast. Gen. Lafayette and other officers of Washington's army once rested under its spreading shade while on the march, and a visit to the tree by Woodworth is said to have inspired the poem, "The Old Oaken Bucket."

In front of Macedonia Church, in Columbia county, Georgia, is a quivering tree. Every limb, large and small, on the tree trembles as in fear, or as a suffering animal would quiver, and this occurs when not a breath of air is stirring.

The Scotch fir is a blessing to the country in which it grows. The poor man's hut is lighted by torches made of the branches, which burn most brilliantly owing to the resinous nature of the wood. In the barren parts of Sweden and Lapland the peasants select the oldest and least resinous of the branches, take out the inner bark, which they grind and mix with their scanty supply of meal, making it into cakes called bark-bread.

In the islands of the West Indies grows a tree resembling an apple tree in hight and size, known as the calabash tree. It has wedge-shaped leaves, large, whitish, fleshy blossoms that grow on the trunk and big branches. The fruit is much like a common gourd, only a good deal stronger, and often measures 12 inches in diameter. The hard shell of this is cut into various shapes by the natives and is sometimes handsomely carved. It is made into drinking-cups, dishes, pails, and even pots, and can actually be used over the fire for boiling water. But the calabash pot gives out after a few trials over the fire, and is unfit for further service.

Probably the only trees which grow ready-made whistles are those found in the forests of Nubia. When this tree is swayed by the wind, strange sounds may be heard like the notes of a flute, a fife, or a penny whistle. The vocal tree was a wonder to all who heard the mysterious sounds, until explanation was given by a scientific traveler who investigated the matter. He found that at certain seasons of the year hordes of insects deposited their eggs on the young shoots and ends of branches. When the young insects emerged, small holes were left in the galls. The wind blowing through these openings caused the strange noise.

In New Zealand is a tree fatal to birds. The seed vessels give off a sticky fluid, and many a fly finds himself on the gummy stuff. These flies attract small birds, and they too get so covered with the fluid that they are unable to fly. They are also attracted by the clusters of ripe fruit, which they intend to eat, but when once covered by this fatal gum they remain, not to eat, but to be eaten by other animals.

The most important article for illuminating purposes in Japan is the candle made from the fruit of a tree which very much resembles the common sumac of this country, and is called "the vegetable wax tree." The berries are the size of a small pea, of a whitish color, hanging in clusters, and contain the wax as a thick, white coating of the seed. The wax is obtained by the berries being crushed, strained and pressed in hemp-bags, or by boiling the bruised seeds and skimming the wax from the top. From experiments made, this tree can be readily grown in this country. It is highly ornamental as well as valuable for its production.

In a part of Africa not frequently visited by travelers, the discovery has been made of a tree which yields butter. Under no system of treatment can it be made to equal that churned from milk, but by salting it is somewhat similar. By heating with a solution of potash or soda it is easily converted into soap.

The "stinging tree" of Queensland is a luxurious shrub, pleasing to the eye, but dangerous to the touch. It grows from two or three inches to 10 or 15 feet in hight, and sends forth a very disagreeable odor. Its effects are curious; it leaves no mark, but the pain is maddening, and for months afterward the part when touched is tender in rainy weather or when wet in washing.

A marvelous palm grows in the village of Pedur, in India. Some children plucked its fruit at five o'clock one afternoon and flocked early the next morning to gather more, but they found the branches now far above their heads. Observation showed that the tree had been changing its position every morning and evening. It is 11 feet in hight. One who has seen it writes: "At 5:30 the tree was almost lying toward the west. The foot of the tree was at an angle of five to seven degrees with the ground, and we were given to understand that it had already commenced to rise from four o'clock. A handkerchief which had been tied to one of the leaves, so that its other end just touched the ground, had risen six inches. At 8 P. M., the handkerchief was eighteen inches from the ground, and at 3 A. M., nine feet."

One of the greatest wonders of Madagascar is the "Traveler's Tree." Its stem resembles that of a plantain; but it sends out its two wing-like leaves (which resemble a large expanded fan) on opposite sides of the stalk. In an aged tree the lowest of these leaves will be from 20 to 40 feet from the ground. The fruit grows in large bunches, with three or four such bunches to a tree. The leaves are used for roof thatching and the leaf stalks twirled together serve for the walls of the islanders' huts. The most remarkable property of this, and the one which gives its name "traveler's tree," is its leaf stalks, which, even in the driest seasons, always contain water; and the wayfarer, if he be thirsty, has only to pierce the thick base of a stalk to obtain fully a quart of pure and refreshing liquid.

Newton, N. C., has a curiosity that beats by a large majority the rain tree which gained such notoriety in Charlotte in 1886. It is a smoking tree, and baffles all efforts at explanation. It is a white mulberry tree, was brought from Illinois a year or two ago, and is now about 12 feet high, with a bushy top and many lateral branches. Puffs of smoke, identical in appearance to cigarette smoke, are seen starting every now and then from all over the tree; sometimes from the leaves, sometimes from the bloom, sometimes from the bark of the limbs or trunk. The puffs are at irregular intervals; sometimes two or three at once from various parts of the tree, and sometimes they are several seconds or a half minute apart. They just come haphazard from any part of the tree, and as they ascend in the air, look exactly like the smoke from a cigarette.

Professor Sohelwisch, the well-known naturalist of Bavaria, while traveling with the Stanley expedition in the heart of Africa, noticed a plant with a peculiar steel-colored foliage. It was growing like other plants from the soil, but on examination was found to be practically composed of iron. The leaves, although very thin, were bent with great difficulty, and in order to secure one, it was found necessary to separate it from the branch with a file. On further examination and experiment, it was found that the plant, or tree, eagerly devoured any metal its roots might come in contact with, and changed its color to the color of the metal last absorbed.

Major Quincy A. Steele, who has been with an engineering corps surveying railroads in Central America for the last two years, gives an account of some very curious trees he met with there. Among the funniest are the electric light tree, a tree which gives milk, and the dough-producing tree. The electric-light tree gives a light so strong that you can read or write by it by night; this tree is not a large one but very conspicuous, and scores of them may be seen over the country, like beacon lights set in the hills.

The milk tree has a big tough skin that can be used for half-soling shoes. To milk the tree, a hole is bored in the trunk; then it lets down sap as white and as sweet as any ever milked from a cow.

The bread from the *bread tree* is not exactly bread when picked, but is a nice stiff dough inclosed in a nutshell about the size of a goose egg. The nut is cracked, the dough taken out and kneaded a little, then is ready for baking. By thinning it down with a little milk from the milk tree, it makes excellent pancakes.

In behalf of those who are interested in trees, I have collected the foregoing from what appears to be reliable literature, and without doubt truthfully describes these forest wonders.

National City. F. L. E.

Forestry and Railroad Ties.

Bulletin No. 4, just issued by the Department of Agriculture, Forestry Division, is a sequel to some previous publications of the division which discuss the relations of railroads to the wood supplies of the country, with reference to the conservation of our forest areas. It contains a brief discussion by the chief of the division, setting forth, upon the basis of a recent canvass among the railroad companies, the enormous consumption of wood material for railroad construction, and especially showing how future supplies are being endangered by the use of the most valuable timber and of the young growth. To satisfy this demand requires the annual culling of the best timber from probably more than 1,000,000 acres of our natural forest lands. The chief value of this part of the bulletin consists in the directions which are given for increasing the durability of wooden ties. These are found to last on an average less than seven years, so that for replacement alone an annual cut of 80,000,000 ties is required. By lengthening the life of the tie a single year, it is evident that a considerable saving would be effected, tending to reduce transportation charges and also to husband our forest supplies. For lengthening the durability of ties, various means are suggested, among which are the selection of lasting timber, proper care in the seasoning of material, attention to the drainage and ballast of the roadbed, precautions against fungi, improved methods in fastening rails, and various preserving processes, some of which are new. The information here furnished is likely to be of value to any consumer of wood material.

The bulk of the bulletin is taken up by a report of R. E. Tratman, C. E., collating the experience of the world in regard to the substitution of metal for railroad ties. It had been stated hitherto that metal ties were used experimentally, but that the time for their introduction was still far distant. This report shows that not only are there something like 30,000 miles of railroad track of the world laid on metal ties, but that where these ties have been used most extensively (namely, in Germany, India and the Argentine Republic), they have shown themselves superior to wooden ties in producing a safer, more permanent, and in the end more economical track. The report is exhaustive, full of the detail which alone can make it valuable to the engineer, and promises to be an important aid in the solution of the metal-tie question, which in this country has received little consideration, from the belief that it is either impracticable, or, with our seemingly inexhaustible timber supplies, premature. The use of the metal tie is expected to economize wood supplies, and by its cheaper maintenance and other favorable features, to reduce transportation charges and increase rapidity and safety of travel.

Mexican Mines.

An old-time miner, who is now living in the City of Mexico, has the following to say about the mines of the Southern Republic: I began mining in 1852, in California, and I have been engaged in mining ever since. I have lived here, studied the country, invested hundreds of thousands of dollars in mining, and have good reason to be satisfied. The country is not a tenth part prospected. There are great numbers of rich mineral deposits unworked. It is the land of the modern miner working according to scientific methods, and with the most improved machinery and implements. The railways have made it possible to work mines which formerly were practically inaccessible. It is as safe a country as any part of the Western United States. We have had ample protection from the authorities, and we shall now put fresh capital in here. The movement of New York capital this way in quest of good mining properties has only begun.

In fact, there is an abundance of money in New York City if you can show really valuable properties, but the Mexican owners of mines must give up their exaggerated expectations.

Its Mineral and Other Resources.

NUMBER VI.

[Written for the Press by James H. Crossman.]

Auriferous Gravel.

Lyth creek, 13 miles northwesterly from Colton, Sec. 27, Tp. 2 N., R. 6 W., has an average flow of 1300 miners' inches, of which 1000 inches is utilized by ranchmen for irrigation, and 300 inches for mining purposes. The fall of the creek for the first four miles is 200 feet to the mile; for the remaining distance the fall is 120 feet to the mile. On both sides of the creek the banks are lined with auriferous gravel, in many places 200 feet thick, which has been worked off and on for the past 30 years by both the hydraulic and the drift process. It is estimated that several hundred thousand dollars have been extracted from these mines. At date, however, the most available and accessible points have been exhausted and mining is now conducted in a weak, desultory manner, the want of water for hydraulicking being a serious drawback.

The Granite range is six miles long by three-fourths of a mile wide, coursing nearly northerly and southerly. On both the east and west banks, channels have been eroded—three channels in all. The west side shows a depth of gravel from 50 to 100 feet above its bed, much richer than its eastern companion. The richest pay is found on the rimrock between the old channels and the creek.

George Turk's placer claim is situated six miles from the mouth of the canyon (at an elevation of 3150 feet) on the east slope of the mountain near a spot known as Glenn's ranch, 18 miles north of San Bernardino. This mine was located in 1867, and has been worked irregularly ever since; the water is taken out two miles above the river, using 300 miners' inches. The gold is coarse nuggets, and its mint value is $19.10 per ounce. Good prospects can be found on the east slope of the hill 300 feet above the bedrock of the creek.

At Glenn's ranch, Tp. 2 N., R. 6 W., Sec. 22, S. B. M., a vein of gold-bearing quartz occurs which gives a good prospect in the horn spoon, but with no other work of development than a six-foot shaft. On the headwater of Lyth creek and its tributaries, numerous small gold-bearing veins occur on which but little development has been made. At Hot Springs, at an elevation of 2605 feet, a quartz vein crosses the traveled road on which an open cut has been made. The vein is from three to four feet in width, carrying both gold and silver assaying from $5 to $10 per ton.

Pliocene Gravel.

On the westerly slope of Antonio Peak, at an elevation of 5140 feet, a dead-river channel containing auriferous gravel was discovered in the summer of 1882 by Messrs. Amee and Henderson. The channel bed is filled with auriferous gravel, dissimilar in every essential particular to the alluvium that fills modern rivers. Judging from developments in the bed of this ancient river channel, it flowed from the north, bisecting the range at this point. The lowest point of the channel on the southerly side of the mountain shows an elevation of 5140 feet above tide-water. From this point southerly to the ocean, 48 miles distant, the grade is precipitous. In the first 15 miles the fall is 512 feet to the mile (the elevation being 457 feet). The remaining 33 miles to tide-water we find a fall of less than 14 feet to the mile. On the northerly flanks of the mountain range we find (estimating the level of the channel bed, not allowing for grade,) that we reach the Mojave desert in a descent of 5403 feet. The elevation at a point opposite is 2737 feet; distance, 18 miles on a horizontal line.

There has been a subsidence of large areas of land in the valley and desert regions lying both north and south of this range, as is generally acknowledged by writers and scientists. Previous to this event, in all probability the valley and its shore line extended southerly and westerly from 60 to 70 miles farther in this direction, at least as far as San Clements and San Nicholas islands, to say nothing of the Channel islands, on which have been found remains of the mammoth mammal (vide Prof. Le Conte). Vast quantities of auriferous gravel are found on the southerly flanks of San Gabriel mountain, extending in places as far as the Pacific ocean. In many places the bluffs on the beaches are entirely composed of gravel resembling the bluff on each side of the mouth of the Klamath river.

This Antediluvian Water-Course

Is old, very old. It is aristocratic and high-toned, living way up in the snow-clad Sierras, but has seen better times and a warmer clime, judging from the fossil branches and trunks of trees that have recently been found in its bed. It was of mammoth proportions in keeping with the monster brutes that once roamed on its banks and laved in its waters, their remains still being found at lower elevations (vide Prof. Preston's, p. 202, Ninth Annual Report of our State Mineralogist).

But to return to our mutton. The gravel in the channel referred to resembles the Pliocene gravel-beds that are so extensively worked in the middle and northern counties of our State. The gold is of a peculiar shape and color. It is of a greater fineness (in excess of 900) than any gold found in modern rivers, unless derived from the class of channels referred to. The channel in question is being developed by three companies, each holding 1500 feet of frontage, extending back to the center of the divide. Both the hydraulic and drifting processes are used in developing these mines.

At the Head of San Gabriel Canyon,

Northwesterly from this point and at about the same elevation, the same character of gravel occurs, apparently an outbreak from the main lead. This class of gravel can be traced down the San Gabriel river to its mouth at a point southwest of Los Angeles for a distance of 30 miles. Below San Pedro, fronting the ocean, the gravelly bluffs of the shore line rise to a hight of 75 feet and extend for four miles.

The gravel-banks on the San Gabriel river are known to be rich, and several companies have been formed to work them, but for some reason unknown to the writer the projects have invariably fallen through and no active work commenced.

The Bald Mountain

Gold mines are in successful operation. The width of the channel-bed has been proved by crosscuts, and found to be from 200 to 250 feet at its lowest point in the center, with gradually-raising rims on either side. That portion of the channel that is being hydraulicked is from 30 to 200 feet in hight. The present workings are on the westerly rim of the channel. The course of the channel is northwest and southeast.

Water is obtained from the melting of snow, which is caught in storage reservoirs of small dimensions, and used under a 300-foot pressure through a 6-inch pipe, with a 2½ and 3-inch nozzle. The seasons are necessarily short, commencing in May and ending in November. The gravel first passes over a grizzly; thence through three 16-foot boxes, 16 inches wide and 24 inches deep, set at a 16-inch grade to the box. Quicksilver is not used on the boxes or ground-sluices, but in the undercurrent. The boxes contain riffles, 2x4, set at a sharp angle, 1½ inches apart. The mine is only worked in the daytime, but the yield is reported to be $8 per day to the hand; only six men are employed.

Bear Valley

Mining District is located on the southwest corner of Tp. 3 N., R. 1 E., and in the southeast corner of Tp. 3 N., R. 1 W. Here large areas of gravel occur which have been worked in an irregular manner by Mexicans who have, it is reported, drifted out the most valuable and accessible portion of the rich gravel that lies on and near the bedrock, and extracted large sums of money. The upper stratum to the surface is abundantly rich providing water could be obtained to work by hydraulic process under a sufficient pressure head. In 1886 and 1887 a large portion of the basin was sold by Alexander Del Mar to an English company. A corporation was formed under the name and style of the Valley Gravel (limited). The work of development was inaugurated by driving a long drain tunnel with so little grade and so near the surface that it was found valueless. The bedrock gravels exhausted, and sufficient head could not be obtained to work them owing to their great elevation. The work, however, is still being prosecuted.

Ruby Mining District.

On the east end of the Bear Valley range of mountains, where Cook and Rattlesnake canyons intersect, a flat has been formed of about three square miles covered with auriferous gravel of an unknown depth. The center of the channel never has been reached, although shafts have been sunk to depths of from 60 to 100 feet. The gravel on the rising bedrock is extracted and dry-washed, there being no water in the vicinity. This flat has never been prospected by other than Mexicans. It is reported that by this slow process $8 per day to the hand is not uncommon. The gravel is reported to be abundantly rich if there was water on the ground. The district derives its name from the large number of small rubies and garnets that are found with the gravel, it not being uncommon to get two tablespoonfuls of these stones from a single pan of earth. They are too small, however, to be valuable as gems.

Holcomb Valley

Mining District is situated in Tp. 3 N., R. 1 E., at an altitude of 7500 feet. The district embraces both gold-bearing quartz veins and placer mines. Prior to the year 1873, these mines were principally worked by Mexicans using the arastra process. In 1873, Barney Carter made the discovery of heavy outcrops of a strong and well-defined vein of gold-bearing quartz, coursing N. 40, W. and S. 40 degrees E. The discovery was made on the southeast corner of the above-mentioned township. He made three locations—the Rainbow, Littlefield and Moonlight.

Other discoveries followed, and about one mile farther north, five other locations were made on croppings that occurred on the same line of strike. These last are respectively known as the Last Chance, Cynthia, Morrison, Gulch and Hub, all of which are held by the present owners under a United States Patent. In 1873, E. J. Baldwin, Samuel T. Curtis and others of San Francisco purchased a portion of this property and erected a 10-stamp mill on the Rainbow, and after incorporating the three first-named mines made a stock deal, floated the stock and made a run of the mill. The rock crushed is reported to have paid $10 per ton. Shortly after the mill burned down, work was suspended, and never has been resumed. United States Deputy Surveyor Wm. J. Reynolds, by whom these mines were surveyed for patent, in his official report to the U. S. Surveyor-General, says: "The gold-belt is about three miles wide, having a general northwest and southeast trend. The altitude by aneroid at the Rainbow was found to be 8000 feet, and at the Cynthia 7000 feet. The geological formation on the southwest side is of gneiss flanked by micaceous granite, and that on the northeast side by metamorphic slate, in turn flanked by a talcose schist; the latter rock by granite, with an overlying deposit of limestone. The thickness or strength of the vein is from 20 to 40 feet, with a northerly dip of 84 degrees. Its gangue, granular quartz, hanging-wall serpentine, and footwall metamorphic slate." Capt. Peter Mackie of San Francisco furnished the writer with the following description of the

Green Mine.

1500x600 feet patented, situated in Holcomb valley. It is developed by shaft 210 feet deep from bottom; a lateral drift has been driven 310 feet, vein from 1 to 5 feet in thickness. From end of lateral drift a winze has been sunk which exposed four feet of good ore in its bottom. An adit can be driven 700 feet below on the line of the croppings, giving 300 feet of additional backs. Grade of average ore $25 per ton; water in the vicinity sufficient for 40 stamps.

Three arastras have just been completed and are ready to start on the ore. Quartz from the mine has been shipped to Daggett and elsewhere for tests, which have given good results. Sawmills in the vicinity furnish lumber at $10 per M. The divide lying between Bear and Holcomb valleys is covered with a dense growth of pine suitable for lumber, which is being utilized by mills in the vicinity, finding a ready sale for their product in the valley towns.

(To be Continued.)

The Demand for Mines.

We believe, says the Eureka *Sentinel*, there is going to be a good demand for good silver mines in the near future. We have advices from New York and Boston which seem to point strongly that way. Eastern capitalists are tired of real estate and real estate booms. They are also tired of loaning on farm mortgages. Millions of New England money has been invested in Kansas and other agricultural States on real estate securities. On most of this money not a dollar of interest has been paid in three years. The Chicago grain market and the New York cotton and railroad exchanges are considered too risky by the general run of conservative investors. What other field, then, is left except mining? With prudence, mining may be as safely followed as any other line of business. It is the most fascinating pursuit in the world. It unwinds hopes and possibilities not realized in any other industry under the sun. It is the most independent occupation on earth. A man with a good mine never has to drum for business. It is he who is drummed by the tradespeople for his business. Personally we would rather have a good mine than any number of ranches in any State in the Union. A mine is a clean-cut proposition that yields up the hard cash, without trouble with book accounts, time notes and slow collections. It is the business, over and above all others, that stimulates all other branches. The great wonder is that more men of ample means do not occupy themselves in this highest type of industry.

The chief reason why they do not grove out of the fact, doubtless, that they do not understand it. It is a big job and a long job to convert an Eastern capitalist into the belief that a silver mine is a good thing to have. The closing down of other avenues of profitable employment for their money will bring them around to the point of investigating for themselves sooner than anything else; and when once their attention is arrested they will not be long in putting in their money. This is the basis of our best hope for money with which to develop our long-neglected mineral resources. There are good mines and good prospects. A prospect is not a mine, but the prospect must always precede the mine. Good mines are scarce and hard to find. They are worth good money when found. Promising prospects are plentiful. Here is the place to draw the line. Too many mining operators palm off mere prospects on the unwary as established mines. This has been the vice of the mining business all through the West. It has disgusted and repelled capital. Honesty should be the rule in everything. It applies to mines and mining as to everything else in life. If you have only a prospect, say it is a prospect and sell it as a prospect and nothing more. Then no one will be deceived. The business of enlisting capital for mining is a tedious undertaking and full of disappointments, but we believe it is going to get easier right along until we have renewed activity all though the mining regions of the West.

THE MOUNTAIN SPRINGS.—Though the greater part of the snow deposited in the mountains last winter has disappeared, we are still deriving full benefit from it. The water from the melting snow descended into the ground and into the fissures of the rocks, and is now feeding all the mountain springs. Instead of shrinking in volume or going dry, as usual in recent years, these springs continue in full and strong flow, and thus a good stage of water is maintained in all our creeks and rivers. It is thought that the renewal of life in the springs is such as will continue two or three years, even though we shall not in that time be again favored with another such mighty snowfall as that of last winter.—*Virginia Enterprise.*

The American Race.

We have none. We are one people only by law, language, industry and commerce. In all else we are wide apart. Race, color, religion, thought, habit and condition, oh, how wide apart! We are gathered from the ends of the earth and exhibit specimens of the highest and lowest degree in all.

But come back here in a thousand years and you shall find all this vanished into thin air. We shall be one race—the American race. All trace of these distinctions will have passed away. There will be only one blood, bone, flesh, color and form—the American people will be one great family.

In a thousand years the white blood will have worked down among the darkest and lowest, and the black, Chinese, Indian and other blood will have crossed and streaked the first families. They will all be one flesh and the distinctive features will have passed away.

What will that race be? White, without a doubt, from light blonde to dark brunette. But all will pass for white. The prevailing element, the wealth, education, mental force and mastery and the numbers of the whites will make them the type, the race; but all the rest will leave their mark, here weak, there strong, but seen more or less all round.

Shall we be a superior race? How shall we compare with Europe, with the English, French, or German? Will the pure or the mixed prove the superior? Will there be a white race anywhere that will loom up above us and look down upon us as we do now upon the Chinese? Who can tell? History gives us no guide, no solution of this question. Pure races yet stand at the head of civilization.

Among ourselves, blot out the white element, and we should step down from the front rank among the nations; England, Germany or France would soon regard us as an easy prey; and when the mixture is thorough, and we are one people with all this mixed blood, shall we still hold the first place or drop to a second or third, and look up to the purer blood of Europe as something away above us?

We would none of us wish to have it. We are proud and we shall always be proud to be called Americans. We would have the American race first in the world. We would all be willing to do something to make it so. What can we do?

We cannot avoid the mixture of our races. It is not possible. The proudest family in the land cannot do that. For a time, perhaps, in the end, never! Time will bring us all into one pool. Beauty, talent, wealth and erratic love will do that for us in despite of all our efforts to prevent. A thousand years is a long time.

There is probably not a man in England who could not trace his lineage to King Alfred, and also to the shepherd who kept his herd.

Again, then, the question recurs, what sort of a people shall we be in the year 3000? We are working out the problem now. We are fixing the factors. We are mixing the dough to make that bread, and settling whether it shall be white, brown or black, and what it shall be in all other respects.

If we are wise we shall be very sparing of inferior elements. We shall close our doors in the face of all who will tend to degrade us. If they come they will increase and leaven the whole lump, as we have seen. Is it not enough to make us resolve "that no more shall come to stay and live among us who will not tend to improve rather than deteriorate our general average"?

We should begin this work now. Begin with the lowest, the most objectionable, and let the work of exclusion go on till none can come among us who bring objectionable form, defect or disease.

There is no fear that our numbers will suffer by this process. Indeed it is certain that within two centuries the tide of population must set away from us, for the reason that we shall be too thick upon the ground.

God made mankind so prolific as to stand the wear of savage life in the woods, and still hold their own and increase a little all the time. When war, famine, pestilence and death by wild beasts are removed, almost entirely, as with us, we increase very fast. Some aver that we may double every 25 years, till want of space forbids.

Now let us make it 50 years, to be sure, and what remains? In 1990 we shall be 80,000,000; in 1950, 160,000,000; in 2000, 320,000,000. We shall still be less than 50 to a square mile, and may double again before the year 3000. But that will perhaps be all we can do.

Numbers are no longer an object with us, either for strength or progress; and the time is not distant when we must not only accept none from the outside, but must begin to prune those within, with a view to maintain the purity of our race and security for our peace, happiness, liberty, and our republican institutions.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—Amador *Ledger*, Sept. 13: The Kennedy mine is reported to be looking splendid. Indeed it has taken its place as one of the best hullion-producers of the county. The ore body is large and of excellent quality. The chlorination works are making satisfactory progress. Ten stamps of the Amador gold mine are kept running. Mr. Bugby resigned the superintendency of the Clinton Con. Co.'s mines near Irishtown last week, and left for the city. Robert Steveoson, the president, is now in charge of operations. The last monthly cleanup of the Wildman was one of the best ever made at this prosperous mine; rumor has it that the yield amounted to over $20,000, or $1000 to the stamp.

SUTTER CREEK.—The Lincoln mine is running along as usual, under Mr. Stewart's personal supervision, and the ore which is being sent to the bin is of the usual paying quality. Sinking at the North Star is finished. The station is cut and drifting was commenced to-day. Two drifts are to be run; one southeast, the other west. A double shift will be put on each and the work will be pushed with all possible speed. It is believed that within 12 months the fate of this prospect, which has been so faithfully stuck to by the enterprising people of Sutter Creek, will be definitely known. The Sutter Creek mine is moving along in a slow and sure style. Mortars for the mill are on the ground, and will be placed in position in a short time and the mill started up.

Calaveras.

THE PIONEER.—*Mountain Echo*, Sept. 13: The Pioneer, better known as the Tiberghein mine, west of Angels, is making an excellent showing. We were presented with some samples of the ore the other day, and judging from its appearance it is as good as any we have seen in this vicinity of late years. Hallock & Hicock are now prospecting the ore by the arastra. The ore is roasted before it is worked. By this treatment, something like a definite idea of its paying qualities can be arrived at.

Mariposa.

LUCKY PROSPECTORS.—*Gazette*, Sept. 13: Geo. Curtis and Tom Borden, two young men from the Coulterville side, came over to Whitlocks a week ago to make a raise out of some of the gulches of that locality. Last Tuesday morning the two men started for the place where Mr. Curtis had found a prospect, and in a very short time after reaching the spot, Borden, in carelessly breaking up some dirt, struck something shiny, which proved to be a 24-ounce chispa. The specimen is very beautiful, containing very little quartz, and is of the usual bright color and fineness of the Sherlocks gold. They came into town the following day and recorded their claim, which is in a little gulch east of Lyon's gulch. All of the Sherlock and Whitlock country abounds with rich leads and many fortunes have been made there, and, judging from the earnest-looking class of men now working there, more will be made. Those young men evidently are on a rich lead.

Mono.

BODIE. — *Alta*, Sept. 15: The west crosscut, 700 level, was extended 11 feet. North drift from joint west crosscut, 700 level, was extended 7 feet. Winze from No. 1 west crosscut, same level, was extended 6 feet.

MONO.—East crosscut from south drift, 700 level, was extended 10 feet.

BULWER.—Upraise from south drift, Bulwer tunnel level, was extended 11 feet.

Nevada.

THE SAUVEE MINE.—*Tidings*, Sept. 12: Supt. Palmere of the Sauvee mine returned this morning from San Francisco, where he has been consulting with members of the company who are working the property. It was decided to sink a winze from the tunnel, which is now in about 700 feet, at a point 600 feet from the mouth, and sink about 50 feet if the pay chute of the ledge is not struck before. The Sauvee is near the Empire and W. Y. O. D. mines.

CRUSHING. — *Tidings*, Sept. 11: The Crown Point mill is now running through a large crushing of ore from the Peabody mine. New pump rods are being put into the Idaho mine from top to bottom. A fine bar of silver bullion was sold to the Citizens' Bank the other day, which was taken from sulphurets at the Mountaineer mine. That property is a steady dividend-payer. A cleanup of 60 tons of ore has just been made from the W. Y. O. D. quartz mine, which yielded over $50 a ton. This ore was taken out in sinking the shaft and did not represent any ore from the drifts or stopes, and did not include the sulphurets, which are rich. The company has also just received a return from 10 tons of sulphurets that were sent to Denver for treatment, and which yielded $300 per ton. Work has been discontinued on the Menlo properties—the Homeward Bound and Wisconsin mines—and only a sufficient number of men are retained to keep the pumps going. This action on the part of the lessees is not from any dissatisfaction with the property, so it is stated, but to determine, before any further expense is incurred, as to whether the property will be taken on the terms at which the bond was given. The reports of the developments on the two mines have been of a favorable character of late.

ANOTHER STRIKE IN THE IDAHO.—Grass Valley *Union*, Sept. 13: In sinking the shaft below the No. 17 level of the Idaho mine, quartz has been found that shows well in free gold, which it is estimated may go from $80 to $100 per ton. This find is entirely disconnected from the regular pay shoot, being hundreds of feet distant from it, and may prove to be a distinct shoot. The ore is different from the heavily sulphuretted ore discovered in the same vicinity some months ago.

Placer.

THE DRUMMOND QUARTZ MINE.—*Herald*, Sept. 13: We learn from a gentleman who is in a position to know that since Mr. Wm. Werry resumed charge of the Drummond quartz mine, near Iowa Hill, he has put things in good shape and has the mine again on a paying basis. Rock is being taken from the old stopes which Mr. Werry's predecessor had condemned, and is paying well. These stopes are extensive and the vein is large, assuring rich rock for a long time. Besides these, No. 2 tunnel, now in between 500 and 600 feet, will afford new backs of virgin ore on a strong vein so rich in places as to show free gold. No. 2 tunnel has just been connected by a winze 500 feet from its mouth with tunnel No. 1, which will facilitate the working of both by affording excellent ventilation. A shaft is being sunk about 800 feet from tunnel No. 2 on what is known as the Hobson tunnel. This shaft shows a four-foot vein, also of excellent ore. In time this shaft will connect with tunnel No. 2. Until the connection is made, however, the ore from the shaft is being hauled to the mill in a dump-cart. The mine, in short, is open in good shape, and in all the openings it gives evidence of being a strong lead of good-paying ore. Mr. C. F. Reed, the owner, is to be congratulated on his prospects.

Plumas.

THE EUREKA MINE.—Greenville *Bulletin*, Sept. 10: This property is owned by a London corporation, and it is the most extensive and important in the county, employing, as it does, about 230 men and consuming directly and indirectly a great deal of the produce of the county. The mine was discovered early in the '50's, and it has been operated ever since. The property is operated on a very economical scale. John Hosking is the local superintendent and T. B. Inch the secretary. The latter has been in the employ of the company about 16 years.

FRANKLIN HILL.—This property is situated about ten miles from Johnsville, a portion of it being in Sierra county, the remainder in Plumas. It bids fair to become one of the best drift mines in the State. The Jones Bros., D. McFarlane, A. W. Sperry and others of Sierra Valley, are the fortunate owners. The mine is at an altitude of 4500 feet and consists of three locations. During the past two years, with an expense of $5300, the company took out $33,000.

OTHER MINES.—Peter Lorenzo is mining on Squirrel creek and getting good pay, likewise Nick Ross & Co. at the same place. The Fairview mine is owned by Miller & Cook of Mohawk Valley. When operated it pays well; about $8 per day to the man. The Mayflower, near the head of Mohawk Valley, is owned by Hapgood, Black & Co. They have a Huntington mill on the property, and extraction of ore will be resumed this week. The ore contains much silver, and we are informed that works for saving that mineral will be connected with the mill.

San Diego.

AT JULIAN.—*Sentinel*, Sept. 12: W. O. Havermale this week drove another spike in the wheel of progress by purchasing the High Peak mine. His purchases are for the purpose of development and will do more to make things boom than all the plotting and scheming that could be indulged in. The mine will be worked now for what it is worth, and the best wishes of the camp are extended to the purchaser.

Shasta.

MINING CAMPS.—Redding *Free Press*, Sept. 13: J. D. Campbell came down from the Silver King mine on Squaw creek Saturday. Jim is a close observer, and he has lately been looking over the various mining camps on the great mineral belt which embraces such mines as the Brown Pearl, the Niagara, the Washington, the Iron Mountain and the Uncle Sam. All the mines visited showed a spirit of activity, and many of them are putting in more machinery and extending their works. It is a self-evident fact that the mines of Shasta county are attracting the eyes of capital all over the world, and capital judiciously invested has never failed to pay.

Siskiyou.

GRAVEL.—Redding *Free Press*, Sept. 13: W. H. Fowler, the mining man, returned from a trip to Hornbrook, Siskiyou county, last Saturday. About three miles from Hornbrook are the gravel mines owned and operated by Jillson & Co. The character of the gravel in the lead upon which these mines are located is similar in every respect to the famous blue gravel lead which has paid so enormously in Sierra, Butte, Plumas, and other counties. In fact, it is even asserted that this Siskiyou lead is merely a continuation of the blue gravel channel of the counties named, being the bed of an ancient river that traversed this region in prehistoric times. Wherever the lead has been struck it has paid enormously. Jillson & Co. have taken out over $15,000 this season, and have scarcely got beyond the face of the channel.

NEVADA.

Washoe District.

OPHIR.—Virginia *Chronicle*, Sept. 13: All work during the week has been confined to retimbering the east crosscut on the 1465 level, which has been reopened and connected with the bottom of the winze sunk from the sill floor of the 1300 level. The lower part of that winze from the 108 point down was carried down with one compartment only. A second compartment will be made by raising from the bottom and then we will be well prepared to resume our prospecting work from the winze, beginning at the point—which is 108 feet below the sill floor of the 1300 level.

MEXICAN.—On the 1465 level the upraise started in east crosscut No. 1, at a point 32 feet in from the north drift, has been carried up eight feet (total hight 38 feet) in hard porphyry.

UNION CON.—On the 1465 level east crosscut No. 1, started at a point opposite the west crosscut No. 4, has been extended 10 feet (total length 782 feet) penetrating the east country rock. This crosscut has been stopped, and we are preparing to run a second crosscut (No. 2) from the north lateral drift at a point 200 feet north from the north boundary line of the mine.

CON. CALIFORNIA & VIRGINIA.—After a suspension of our mining operations for the first half of the past week we resumed extracting and shipping ore on Wednesday, the tenth instant, and there has been extracted from all parts of the mine 738 tons, which was shipped to the Eureka mill. The average assay value of all the ore worked at that mill during the last two days of the week (48 tons) was $22.25 per ton.

CHALLENGE CON.—The joint Confidence and Imperial west crosscut No. 2, on the same level, has been stopped for the present.

EXCHEQUER.—The north lateral drift on the 600 level is out 148 feet, still running in a hard porphyry formation. The east crosscut on the 500 level has its face in porphyry with clay seams.

SEG. BELCHER.—The 850 west crosscut advanced 45 feet, making its present length 120 feet; the face is in low-grade quartz and porphyry.

ANDES.—During the past week on 420 level, north drift from No. 2 crosscut was extended to 102 feet and connected with No. 2 crosscut; formation, porphyry and quartz, giving low assays. After doing some repairing will start the north drift again, which is out 212 feet.

SCORPION.—On the 600 level the southwest drift continues in a favorable formation composed of a mixture of vein porphyry with clay seams.

CROWN POINT.—Shipped to the mill during the week 259 tons 580 pounds of ore, the average battery of which was $13.75.

SILVER HILL.—The usual prospecting work is in progress on the 160, 260 and 334 levels. The vein formation on these levels is favorable.

OCCIDENTAL.—The stopes on the 400 and 450 levels continue to yield ore of a fair grade. All parts of the mine are looking well.

YELLOW JACKET.—Are making the usual shipments of ore to the mill. A good deal of exploring work is in progress and some good streaks of ore are being found.

UTAH.—The north drift on the 725 level is making good progress in vein material showing some quartz.

ALTA.—About 300 tons of ore per week is the average yield from the regular producing sections, which continue to hold out and promise well. Average assays about $24 per ton.

JUSTICE.—Favorable indications are found at most points where explorations are being made. The usual amount of ore is being milled, and the average assay holds up to $36 a ton.

CHOLLAR.—The usual amount of ore is being produced from the producing sections, giving an average assay of about $20 per ton. Exploration and development work go ahead as usual.

POTOSI.—The ore-producing sections are looking and yielding well. Twenty stamps of the Nevada mill are now being run on Potosi ore. As soon as the station (now making) at the 1130 level of the winze is completed, exploring drifts at that point will be started.

WARD COMBINATION SHAFT.—The drift running east from the 800 level station still has its face in porphyry.

IMPERIAL CON.—East crosscut No. 1 on the 1000 level is out 335 feet, 22 feet having been advanced during the week, the face showing porphyry. West crosscut, same level, is out 359 feet, 24 feet having been added, the face showing quartz and porphyry.

ALPHA.—Prospecting at the usual points on the 600 level. The formation is very favorable and occasional bunches and stringers of ore are being encountered.

SAVAGE.—Are extracting ore from the 500, 600, 750 and 1300 levels. During the week we have hoisted 679 cars of ore; shipped to the Rock Point mill 401¼ tons and to the Mexican mill 275¾ tons, and milled 676 tons; average assay, $23.16. Bullion on hand and at the mill amounting to $11,000.

HALE & NORCROSS.—During the week we hoisted 955 carloads of ore; shipped to the Nevada mill 892¼ tons and milled 860 tons; average battery assays, $11 per ton. We have bullion on hand and at the mill amounting to $6600.

CON. NEW YORK.—The exploring drifts on the 650, 800 and 1100 levels are making good progress. The 1400 south drift advanced 12 feet and is now out a total distance of 141 feet. The face is in vein matter composed of low-grade quartz and porphyry. There is no change to report of the stopes for the week. Shipped to the Vivian mill during the week 272 tons and 1650 pounds of ore, the average battery of which was $23.67.

OVERMAN.—Extracted and hoisted from the 1200 level 347 tons of ore. Shipped to the Brunswick mill 339 tons of ore. Battery assays, $18.12 per ton. Total shipment of bullion for August, $33,568.09.

Cedar District.

PROSPECTING.—Pioche *Record*, Sept. 6: This old district, situated some 15 miles south of Cliff Springs, is again receiving considerable attention. Prospecting by new parties has been going on for several months, and the outlook is said to be very good. The traveled road to the district leaves Meadow Valley Wash near the ranch of Jos. Conaway. Some samples of ore brought in during the week ranged from 280 ounces to 800 ounces in silver per ton, and general samples from a 3-foot vein averaged 68 ounces. The ledges of the district are in quartzite formation. The news created much interest in the place, and several parties have already gone there from here.

Eureka District.

BULLION SHIPMENT.—Eureka *Sentinel*, Sept. 13: Wells, Fargo & Co. yesterday shipped 12 bars of Eureka Con. bullion, valued at $28,300; also $1500 in passing bullion.

ORE SHIPMENTS.—*Sentinel*, Sept. 17: During the week the Eureka & Palisade Railroad Co. shipped 200 tons of ore to the Salt Lake City smelters. The following lots of ore were received during the week at the Eureka Con. reduction works from the mines of Eureka district: From the Phœnix mine, 19 tons; Richmond, 46 tons; Whippoorwill, 65 tons; Williamsburg, 32 tons; Dunderberg, 24¼ tons; Lord Byron, 26 tons; Hamburg, 13 tons; Prospect Mountain Tunnel, 4 tons; Mortimer, 3 tons; Lincoln, 10 tons; Woodchopper, 16½ tons; West End, 5½ tons; and Fish Creek Wells, 29 tons. From Nye county—Tyho, 24 tons; Morey, 13 tons; and Reveille, 4 tons. From White Pine, 62 tons. Silver Conner, 64 tons.

Lone Mountain District.

HOISTING WORKS.—*Independent*, Sept. 10: S. G. Weston came in yesterday from Lone Mountain. Mr. Weston is highly elated over his mining prospects in that district, and so sanguine is he of the ultimate success of his enterprise that he has ordered hoisting works, which were shipped from Denver on the 4th instant. He has secured as partners, Morton, Bliss & Co. of New York, a firm of unlimited means, and the work of developing the Lone Mountain mines will be pushed vigorously.

Tuscarora District.

NEVADA QUEEN. — *Times-Review*, Sept. 12: North drift from North Belle Isle line, 550-foot level, has been run 12 feet, exposing high-grade ore; average, $300 per ton. This drift will connect with winze from 450-foot level, which was sunk through ore all the way.

NAVAJO.—The stopes on the 250-foot level are producing a fair grade of ore. The water is now 93 feet below the 350-foot level.

DEL MONTE.—Second level—No. 2 north drift from North Commonwealth line in 27 feet; progress, 14 feet.

BELLE ISLE.—No. 1 east crosscut from the north drift, 250-foot level, extended 14 feet, cutting a considerable width of quartz giving low assays. No. 1 upraise, same level, extended 16 feet, showing more or less good ore all the way. The water is now 93 feet below the 350-foot level.

NORTH BELLE ISLE.—The stopes on the 150-foot level continue to produce their usual quantity of ore. The crosscut near the Belle Isle line, 400-foot level, extended 10 feet. South drift from the crosscut to the ore, 500-foot level, extended 7 feet, showing 3 feet of ore, some of it being very high grade. No. 2 upraise, 600-foot level, extended 10 feet. The upraise at the north end, same level, extended 7 feet; the ore is getting wider. Concentrator running as usual.

COMMONWEALTH.—Hoisted during the week 377 tons. Worked at Union mill, 174 11-20th tons. Battery pulp assay, $187 per ton. Bullion shipped, $28,042 96. Crude bullion on hand, about $12,000.

NORTH COMMONWEALTH.—Hoisted during the week 707 cars of ore. Worked at concentrator 399 tons, yielding 53,000 pounds concentrates. Ore sent to mill, average assay, $188 per ton. Did not work any ore at mill this week, as the room at the rock-breakers was filled with concentrates and wanted to get it clear. Will start milling Monday.

ARIZONA.

MOHAVE NOTES.—*Miner*, Sept. 13: Twiggs & Kelly, who have a contract on the Esmeralda, have the whim up and everything ready for work. Marshall & DeBourdage are working a gold claim near the Night Hawk, and are taking out some good ore. Durden & Gilliland, lessees on the Empire, are taking out good ore; have a carload ready for shipment. T. K. Buttolph has taken a lease on the Haas mine near Mineral Park, and will put on a force of men in a short time. Barney McCall, who has a lease on a portion of the Empire ground, is taking a lot of ore which will go 400 ounces to the ton. The working over of dumps, which before the rise in the price of silver were considered as worthless, is attracting the attention of our miners. Pete Caffrey and Jos. Labaree have a lease on the Night Hawk dump, and have a carload of ore about ready for shipment. They are making good wages sorting the dump. A. W. Eaton, Chas. Gordon and T. B. Wolfe have taken a lease and bond on the Peacock mine in Quigley Wash in Wallapai mountain. W. A. Neal is the owner. Stinson & Boland are working a claim in Todd Basin, above the Oro Plata, and are taking out ore that assays 80 ounces per ton, and are in hopes that it will improve in quality. Frank Welsh, superintendent of the O. K. Co., spent Sunday in Kingman. The machinery has all arrived, and is on the way from Hackberry to the mill, and the mill will in all probability be running by the first of October. The mine is looking fine, and hoisting works will be put up some time during the year.

BRITISH COLUMBIA.

A $9000 SALE MADE.—Nelson *Miner*, Sept. 8: This week Watson & Ernest sold the Fourth, a claim discovered by them on the 4th of July last, for $9000 cash, the purchasers being interested in the Pacific Bullion Co. of Spokane Falls. The price realized is a good one for a prospect, on which but little development work has been done. On receiving the cash, Ralph Watson left Ainsworth for a trip to his home in one of the Eastern provinces.

WORK TO BE COMMENCED ON THE NO. 1.—Work will be commenced the coming week on the No. 1, a claim in the Hot Springs district owned by the Revelstoke Mining Co. A drift will be run north from the tunnel now in nearly 400 feet, then an upraise made to the incline shaft. This will drain the present workings and enable the ground to be thoroughly prospected to a depth of about 300 feet.

GOLD DUST FROM 49 CREEK.—D. B. Huntly reports work at the hydraulic claim on 49 creek delayed on account of lack of lumber for sluice-boxes. This will be overcome, as that veteran whipsawyer John Loge has undertaken to get out the lumber required. Gold dust will be arriving at Nelson within a month from that promising camp.

COLORADO.

LATE ACQUISITION.—Aspen *Times*, Sept. 10: The Late Acquisition is still showing considerable ore. When Manager Ray was asked about it yesterday he stated that the ore had again come in and the property was looking fairly well. The ore, however, he said was very low, running only from 8 to 10 ounces of silver and about 24 per cent lead.

THE SMUGGLER.—The Smuggler has temporarily suspended shipments pending repairs on the drainage tunnel. The ore that is now being mined is taken out just over the main level with which this connects, and is sent out to the railroad through the tunnel.

CONCENTRATOR CONTRACT.—Messrs. Schuler & Stockder yesterday let the contract for the construction of their concentrator building. Mr. Fred Frye is the contractor. Work will be started up at once and the contract calls for the completion of the building within two months. By that time they will have their machinery ready to put in.

DAKOTA.

GALENA MINES.—Deadwood *Pioneer*, Sept. 12: A number of mines in the vicinity of Galena are the scene of busy operations. Shipments from this camp are being regularly made and are increasing in amount as the mines are developed. Nearly all of the ore is shipped to the Omaha smelting works for treatment, and is loaded on the trains at Sturgis, the nearest railway point to the camp. Among the companies now making shipments are the Cora, Gen. Merritt and Richmond, the latter in large quantities. Inspector of mines Corkhill returned from a visit to Galena yesterday, and from him we learn that the Richmond and Merritt are

being steadily developed and are producing some good ore. A reduction of $5 per ton on cost of hipping ore to Omaha will be made when the oad reaches the camp.

IDAHO.

BUNKER HILL & SULLIVAN.—Wardner *News*, Sept. 8: Work has commenced in good earnest for the erecting of the Bunker Hill & Sullivan concentrator. The mill-site is a fine piece of ground of 12 acres within half a mile of the Wardner station of the Union Pacific railroad. Robert Cheyne, who is superintendent of all the work connected with the erection of the mill, has a force of 45 men clearing the route for the tramway and grade for the mill. The building will be a mammoth concern 247 feet in length, 72 feet wide and 40 feet in hight, with a capacity of 400 tons per day. The tramway to be used is known as the "Bleichert Patent System." The entire length of the tramway from mine to mill will be 8820 feet, conveying buckets to and fro with a capacity of 1000 pounds each. The ore extracted will be put through Gates crushers at the mine, where bins will be located with a capacity of 1000 tons. It will then be removed by tramways to the mill, which will also contain 2 Gates crushers, 2 sets of improved Cornish rolls, 16 by 30, 10 sizing screens, 24 jig machines, 3 double-decked Evans tables, 6 Flue vanners, 2 sets of 24 by 14 rollers, 2 sets of 20 by 10 rollers and 2 trough conveyors 100 feet in length to convey the ore from the concentrator bins to the Gates crushers and rollers. The machinery will be run by water-power obtained at the mouth of Elk creek and conveyed a distance of three miles in a flume 8 feet wide by 5 feet deep. Two of the celebrated Leffel water-wheels of 72-horse power each will be brought into requisition. As soon as the grading of the mill-site is completed, work will commence on the erection of the concentrator.

LOWER CALIFORNIA.

A PROSPECTING TRIP. — *Lower Californian*, Sept. 11: W. J. Lyons came up on the steamer Pacheco Monday morning on his way to San Diego. For two months past he has been cruising along the coast below Cedros island in the schooner Ethel, with Tom Owens, stopping wherever there was a suitable landing and prospecting for minerals. Mr. Lyons went as far south as Magdalena bay and looked over the country thoroughly. When asked what he had found, Mr. Lyons said that as the trip was entirely in the interest of other parties he did not feel at liberty to give the result of his labors. However, it is safe to presume that his search was not a fruitless one, for in the large territory which he traversed he certainly must have found more than one good prospect. Mr. Lyons visited La Purissima valley, situated between the 25th and 26th degrees of latitude, about 20 miles back from the coast. There is no timber in the valley, but plenty of running water. The surplus products of the valley find a ready market at Mulege and Santa Rosalia, three days' journey distant, on the Gulf shore, where 4000 men are employed in and about the copper mines, and in the smelter owned by the French Co.

MONTANA.

THE HECLA'S SHIPMENTS.—*Montana Mining Journal*, Sept. 13: The Hecla Mining Company of Glendale is shipping three carloads of high-grade concentrates every week. The company is about to start up another furnace and will run the works to their full capacity during the coming fall and winter.

THE EUREKA AND CHAMPION SOLD.—The sale of the Eureka and Champion mines in Madison county to H. Veeder, representing a Pittsburg syndicate, is announced. A company will be organized to thoroughly develop the properties which have already been opened up to a considerable extent.

HIGH GRADE ORE.—A strike is reported in the Mineral Hill, a new claim on Indian creek, east of Champion, owned by Mishler & Pinney. Assays return from 300 to 350 ounces silver per ton. The extent of the lead is not stated. The property is situated near the Patsy-Watomie groups, recently acquired, and is being actively developed by a St. Paul company.

THE MYSTERY.—At the Mystery, near Philipsburg, the owners are running an upraise from drift No. 3 on the vein to the endeavor to get out of a break in the vein. There are some narrow seams of rich ore in sight, and as the upraise is continued they are much more encouraged, as it seems to be widening out as the break is being gone through. It will not take much more to get through this obstacle, and if the vein continues to widen, the owners will be repaid for their labor.

NEW MEXICO.

BROCKMAN & BEALL'S BONANZA.—*Southwest Sentinel*, Sept. 9: Another new ore body was revealed at the already famous Good Luck mine of Camp Loomis last week, which places that property without an equal anywhere in New Mexico both as regards the quantity and quality of its product. The ore from the new strike yields 28¼ ounces gold and 2400 ounces silver to the ton, and lies in quantity. A carload will shortly be shipped to Denver for treatment. That Brockman & Beall, the owners, have a fortune in the Good Luck is undoubted. Indeed everything John Brockman has touched lately has turned to gold.

OREGON.

CORNUCOPIA DISTRICT. — Union *Republican*, Sept. 12: Reports on the mines of Union county continue very flattering. Every camp seems to be enjoying greater prosperity than for some time past. The discovery made on the abrupt mountain south of Paddy's Paradise near the road leading from Union to Cornucopia is showing up very well. The owners, Messrs. White & Buckland, have an arastra in operation, operated by a water-wheel, and are meeting with success. At the Cornucopia camp everything is "looking up." The miners are more encouraged, development work is progressing nicely, and many outside capitalists are quietly coming in and looking over the situation, and it is quite probable that a great deal of property will go into there before many months. The rich strike made in the Red Jacket a short time ago, stirred up quite an excitement. There is something like 2000 feet of tunneling in the mine. Mr. J. C. Duffy of Cornucopia was in Union Monday, from whom the *Republican* learns that a Scotch Co. had bonded the Forest Queen group of mines for the sum of $30,000 for one year, $2000 to be paid the 1st of November. These mines are owned by Fifer of Huntington, Reed of Sparta, and Cox of Cornucopia, and were the first to be located in the camp, and are considered among the best there. It is thought to be the intention of the new company to commence active operations.

UTAH.

PARK NOTES.—Salt Lake *Tribune*, Sept. 15: Received at Park City sampler for week ending Sept 13th: 928,060 pounds of Ontario ore; 324,890 pounds of Anchor concentrates; 41,360 pounds of Alliance jig; 27 510 pounds of Mayflower jig; 39,130 pounds of Woodside ore. Total, 1,360,950. The Crescent Mining Co. shipped during the last week, 334 500 pounds of concentrates. Mr. J. M. Richardson, the Crescent leaser, shipped during the week, 33,130 pounds of first-class ore, and 11,380 pounds of jigging ore. The Anchor tunnel is looking fine, and they are seeding considerable ore to the Union concentrator. The Woodside is in the field again as an ore shipper, and expects to continue the good work for some time.

REVIEW.—Salt Lake *Tribune*, Sept. 12: The week has shown fair activity in the Stock Exchange. It has been a big week in ore shipments and fair in bullion. The receipts of the minerals in this city for the week ending the 10th instant, inclusive, were to the total value of $327,921, of which $248,420 was in ore and $79,501 was in bullion. For the previous week the receipts were valued at $304,884 26, of which $149,251 was in bullion and $155,633.26 was in ore. The product of the Ontario for the week was from ore sales, $17,916.18; bullion, 22 653.50 fine ounces, an approximate total of $40,569.68. The Daly output for the week was in ore sales, $9254.33. The Horn Silver pushes on production steadily, and the sales of ore average about $1200 a month, which goes mostly to Colorado. Bullion receipts in this city for the week were to the value of $42,626 by Wells, Fargo & Co., and $1000 gold bar by the same firm; McCornick & Co. (Hanauer), $33,550; T. R. Jones & Co., selected lead, $2325. Ore receipts in this city for the week were to the value of $157,857 by Wells, Fargo & Co.; $70,650 by McCornick & Co.; and $20,713 by T. R. Jones & Co.

WASHINGTON.

OKANOGAN.—*Outlook*, Sept. 8: Geo. Pfunder is working two shifts in the crosscut tunnel on the Second Thought mine. They are now in 120 feet and close to the ledge, which will be tapped 155 feet deep. E. D. Broughton has a force of men at work on the Okanogan Chief, a short distance below Ruby. R. H. Bliven of Ruby made several assays from the capping of the ledge this week, which run from 40 to 120 ounces in silver to the ton. One of the most promising prospects on Palmer mountain, as shown by recent developments, is the Dexter. A shaft has been sunk on the ledge about 20 feet, exposing an ore chute two feet thick of sulphuret ore in which there is a large quantity of brittle silver. Choice specimens will assay up in the thousands, and an average of the pay chute, as shown by three different assays, will go 450 ounces per ton. This promising claim is owned by Fred Bollman of Walla Walla and M. S. Dudley of Loop Loop.

THE PIERCE RIVER excitement has died out, and the prospectors who left these diggings three weeks ago, attracted thither by the display of a few specimens and a story of immense bodies of high-grade galena ore, are now returning with a weary and disgusted look on their faces. J. M. Haskell, the California expert, was one of the first to visit the new excitement and the first to return. He expresses his opinion of it in very forcible language. The country, he says, is the most inaccessible he has ever prospected in, and as a mining proposition is the biggest bilk on record.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

CALIFORNIA MINERAL-WATER SUPPLY Co., Sept. 15. Capital stock, $100,000. Directors—Chas. M. Miller, S. E. Brooks, T. M. Van Winkle, F. A. Waterhouse and H. K. Waterhouse.

TIBURON IMPROVEMENT Co., Sept. 15. Capital stock, $500,000. Directors—Isaac Moore, L. J. Lewis, S. A. Eldridge, Geo. T. Bohen and A. W. Blow.

AMERICAN FARMERS' ALLIANCE OF CALIFORNIA. Object, mutual protection of farmers. Directors—W. H. Griswold, Elias Norris, W. H. Reddell, G. T. Mason and J. D. Crawford.

CALIFORNIA FRUIT-SHIPPING-PACKAGE DEVELOPMENT Co., Sept. 15. Capital stock, $20,000. Directors—G. H. Kriechbaum, W. A. Harvey, O. A. Shaw, C. J. Sharp, M. B. Frost, C. E. Gates and A. C. Harris.

NEWPORT VINEYARD Co., Sept. 15. Object, to develop land in Tulare and Fresno counties. Capital stock, $70,000. Directors—E. J. Root, L. S. Whittenden, F. A. Blakely, J. A. Merrill and K. Leak.

COQUILLE G. M. Co., Sept. 16. Capital stock, $1,000,000. Directors—S. A. Raymond, F. Braisted, W. Adams, F. W. Bowen and C. H. Watson.

SILVER AGE G. & S. M. Co., Sept. 15. Location, Nevada. Capital stock, $10,000,000. Directors—W. M. Park, J. W. Key, E. F. West, J. J. Scoville and P. P. Schmidt.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the same it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 9, 1890.

436,204.—SNOW PLOW—L. J. Bergendahl, Port Townsend, Wash.

436,170.—WATER-WAY AND GATE FOR RESERVOIRS—T. B. Craycroft, Panoche, Cal.

436,228.—STEAM COOKER—Jane E. Ford, Ross Station, Wash.

435,966.—SASH HOLDER—F. Frank, Suisun, Cal.

436,230. — SAFETY GAS-BURNER—Frechette & Dupuis, Carson, Nev.

435,926.—GAFF JOINT FOR VESSELS—P. E. Frostad, La Conner, Wash.

435,927.—PIPE COUPLING, ETC.—J. Ginty, San Diego, Cal.

436,180.—FENCE MACHINE—T. P. Madill, Albany, Ogn.

436,293.—WINDMILL—R. B. Sinclair, Alameda, Cal.

435,983.—ELECTRICAL TRACTION APPARATUS—Wm. Stephens, Santa Rosa, Cal.

436,027.—ORE STAMP—C. W. Tremain, Portland, Ogn.

435,986.—DIE FOR MAKING LATHING—Geo. H. Tucker, S. F.

436,278.—REFRIGERATOR—Vecchio & Mignola, S. F.

The following brief list by telegraph for Sept. 16 will appear more complete on receipt of mail advices:

California—George S. Andres, S. F., apparatus for making extracts; James T. Fish, S. F., fruit-pitting machine; Smith McGaryin, San Jose, running gear; Frank McClure, Stockton, chuck for turning lathes; Dr F Oliver, S. F., bay rickers; Henry A. Peabody, Ukiah, fence post; Charles B. Towle, Vallejo, school desk; Frank White and F. J. Murphy, Pomona, animal trap.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the pateots recently obtaioed through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAW-BIT HOLDER.—Stepheo H. Chase, San Jose. No. 435,556. Dated Sept. 2, 1890. This is an improved device for holding removable saw-bits in the saw-plate. It coosists of a locking-plate having a circular inner eod adapted to turn in a correspondingly shaped groove in the throat of the tooth openiog, and having the outer end io the form of a circular coocentric segment adapted to fit the correspondiog curve of the saw-bit, and an elastic spur or projection from the segmental head which fits ioto a corresponding chaonel made in the saw-plate.

ELECTRICAL TRACTION APPARATUS. — Wm. Stephens, Santa Rosa, Sonoma Co. No. 435,983. Dated Sept. 9, 1890. This apparatus is especially useful for propelling plows or harvesting machioes by means of a motor and intermediate conoections whereby said motor may be kept constantly connected with a stationary source from which the electrical energy is supplied to the motor, while the motor and machinery are allowed to travel various distances from the source of supply without destroying the coonection.

STEAM COOKER.—Jane E. Ford, Ross Station, King Co., Washington. No. 436,228. Dated Sept. 9, 1890. This is one of that class of steam cookers in which the steam is generated from a body of water underlying a false bottom and passes up through suitably arranged tubes into the utensil department of the cooker. The invention consists in the novel construction of the lower portioo of the steam cooker, including its false bottom, its supply reservoir, its steam tubes and its supporting plate; also in the construction of the top of the cooker, whereby a condensing chamber is formed, and in the coostruction and arrangemeot of the ulensils in connection with the receiving compartment of the cooker.

REFRIGERATOR. — Stephaoo di Vecchio, San Jose, and Joho Migoola, S. F. No. 436,278. Dated Sept. 9, 1890. This refrigerating apparatus for meats, etc., consists of an exterior casing with the proper non-conducting filliog, au interior vertical chamber for containing ice, and a surrouoding movable framework with hooks or shelves for supporting meats or other substances, together with pipes or passages for the escape and distribution of the cold air.

SASH-HOLDER.—Ferdinand Frank, Suisun, Solano Co. No. 435,966. Dated Sept. 9, 1890. This invention, which the inventor calls a "window-lock," consists of a device whereby both the vertically-moving sashes of a window may be simultaneously locked with reference to each other at any desired point. The rattling of the sashes is also prevented.

DIE FOR MAKING LATHING.—Geo. H. Tucker, S. F. No. 435,986. Dated Sept. 9, 1890. This is a die which is especially adapted for the manufacture of lathing made of metal sheets, which sheets are folded so as to form alternate elevations and depressions, with acute angles and correspondingly inclined sides to said depressions for the purpose of forming a bond to hold the mortar in place. The invention consists of a peculiarly shaped metal die adapted to bend these sheets, of which the laths are formed, into their proper shape.

Table of Lowest and Highest Sales in S. F. Stock Exchange.

MECHANICAL PROGRESS

The Latest Aluminum Process.

The discovery of a new aluminum process by a gentleman in Chicago, recently, has been widely announced in the trade press. The reported discoverer, Mr. E J. M. Hirsh, in a recent letter to the *Industrial World*, thus gives further particulars:

"Complying with your request for a brief statement regarding aluminum, I beg leave to say that I can certainly make it for 15 cents a pound, having proved that fact by actual test, and most likely for one-third that amount, in spite of the opinion expressed by a New York chemist that 25 to 50 cents was the lowest price he considered possible to make the metal for. He guesses upon a basis of ignorance and I state from actual experience. But while I can produce the metal at that price, I do not propose at this stage to sell it for that figure. I have orders enough on hand for the metal at a high price to keep me busy for several years, even with a capacity many times my present one, and although I shall produce in the immediate future considerable quantities, it will not affect the present market value of the metal for a long time, as my orders for manufactured goods will realize for me the present price of the metal and still produce the manufactured articles as cheaply as if made of any of the common metals."

Mr. Hirsh gets his clay in the immediate vicinity of his works. It exists in inexhaustible quantities and is of a good quality. He says that it will be impossible for him for many years to do more than meet the demand for aluminum at his present selling price, which, however, is not given. Mr. Hirsh closes his communication as follows:

"I have also received numerous offers of financial aid, which I am compelled to thankfully decline, because I have enough for my present ability to manufacture, and if I had millions at my immediate command, as I have been offered, the element of time has to be considered, which it will require to erect works and start them.

"Were the iron business to-day in the phase of the alumina trade, although the former metal is known to be produced for nearly one cent a pound, the time required for the establishment of iron-mills, with all the varied machinery as it exists now, would require years and millions. Aluminum finds numerous uses where iron or other metals are unfit to be employed, so that the demands for it are really greater than for iron, and a reduction of its market value, even if produced cheaply, must be left to the future. The present great value of aluminum lies not in its ability to compete in price with cheap iron or tin, but in its qualities, rendering it useful and indispensable in cases where the baser and more imperfect metals cannot be employed to advantage. I shall turn out all classes of products that can be made from the metal, but shall not throw any of the crude material on the market, for the reason that my present orders for these products, from a ball to a railroad car, will require all the metal I can produce."

Railroad Car Wheels.

One of the most serious causes of accidents on railroads arises from imperfections in wheels. Notwithstanding the utmost precaution is taken in their manufacture, imperfections will creep into the best material. Perhaps the most careful observations and statistics in this department of railroad work come from Germany, where such work is undertaken by the Government.

The causes of accidents for the year 1889 are given in the last Government report as follows: 1312 fractures were due to impure, spongy or soft metal, 796 to brittle metal, 652 to the effect of heat and cold. In every 10,000 wheels of all kinds, 27 have been broken. In every 10,000 locomotive wheels, 43 broke; 51 failed of every 10,000 on tenders, 35 of every 10,000 on passenger cars, 53 of every 10,000 on mail cars, 35 of every 10,000 on baggage cars, and 25 of every 10,000 on freight cars. As regards the material of the tires, puddle steel made the worst showing, with 68 failures in every 10,000 wheels; then came iron with 47 failures, and finally the different kinds of ingot steel (cast, ornoible, Martin, manganese or Bessemer) with 27 failures per 10,000 wheels. The different lines are now fastening their tires with some of the new methods of the Mansell type, almost entirely. A great number of the failures can be directly traced to injuries sustained during fastening. Of 10,000 tires attached in the old way, 53 failed, while with a like number of wheels using the new methods of fastening only 12 failures were reported. About two per cent of the failures occurred with tires from 0.8 to 1 inch thick; only 0.01 per cent took place on tires of 2.4 inches or over.

MAGNETIC SEPARATION OF ORES.—Considerable interest is being manifested in various quarters in relation to the separation of ores by magnetic selection. Mr. Edison has been working for some time in this direction, and seems to have met with very satisfactory success. He has one or more patents for his machine. Another inventor in Philadelphia is working in the same line. This invention is now in the hands of a Chicago company which proposes to put it into practical use in the separation of the magnetic ores from sea sand. This machine consists of a cylinder, whose surface is composed of electro-magnets, revolving on the inside of an endless canvas belt. The sand is fed to the belt, and a spray of water separates the particles, the iron being retained by the powerful electro-magnets, and carried off on the belt to a receptacle at the other end, while the sand falls into the trough below. It is claimed that the machine, working on sand that contains from five to seven per cent of iron, will extract the iron sand for about one-eighth of its value in the Eastern market. Machines which will do that might find an almost unlimited sale in California for working such sands, which are found in immense quantities for hundreds of miles along our coast.

PETROLEUM USED AS FUEL SIXTY YEARS AGO. Although looked upon as recent, the use of liquid fuel is not by any means new. It is claimed that so long ago as 1830, H. Pinkus made use of hydrocarbon in conjunction with streams of vapor for steam-raising purposes, and from that time down to the present, engineers and inventors have been constantly exercising their ingenuity in the same direction. Among the efforts to introduce this system, we may mention Richardson's petroleum furnace, as well as Bridges Adams', which was for many years in Woolwich Dockyard; while in 1868 the Government allowed Wise, Field and Aydon's system of operating petroleum by the aid of an induced current, to be applied to a marine boiler on board one of their steam yachts. The same system had also at that time been applied to a Cornish boiler in London. The Admiralty also tried an invention of S. E. Crow, but nothing practical resulted; while in the same year Dorsett's petroleum furnace was put under the boiler of the steamship Retriever, 90-horse power and 500 tons burden. Some successful runs were made with the Retriever, but so far as this country was concerned, nothing further seems to have been done. One reason for this change may have been the fact that directly the demand was made for the class of liquid fuel used, and which previously had been almost a drug on the market, the prices went up to such an extent as quite put the idea of any profitable use of oil out of the question.—*London Machinery Market.*

A MULTIPOLAR MOTOR.—A low-speed multipolar motor has just been brought out, which, in addition to being specially adapted to the direct driving of large exhaust fans and blowers, and to operating hoists and travelling cranes, is likely to fill a great want in street-railway work by effecting a considerable saving of the power now wasted in the gearing. Most motors and dynamos are run at a high rate of speed, because it is impossible to secure at a low speed, with the construction hitherto in vogue, the required efficiency, regulation and output. The value of the new type of motor may be understood from the fact that its armature revolutions per minute are between 600 and 500 in the sizes ranging from 4 to 20 horse-power, which is less than half the speed of the ordinary motor, and for special work the winding is adjusted to 350 revolutions. It will readily be seen that outside of the question of efficiency, the saving in wear and tear is considerable. The excellent qualities exhibited by these machines as dynamos will insure their being largely used in small isolated incandescent-light plants. When used for this purpose they are compound wound, and the regulation is said to be so perfect that all but one lamp may be turned off without moving rheostat or brushes, and without appreciable change in the brilliancy of the remaining lamp.—*Ex.*

IRON VS STEEL FOR AXLES.—On account of numerous and repeated failures of axles on the Rajputana-Malwa Railway, the Bombay, Baroda and Central India Railway Company, who work that line, have resolved to replace the steel axles in use by others of the best iron. Sir Alexander M. Rendel, the company's consulting engineer in England, had originally recommended the use of steel for axles, because he thought that steel was not only better than iron, but also because its price was not more than half that of the class of iron suited for axles. He was further moved to do so by the opinion that, while steel was improving in quality, and daily taking the place of the best classes of iron, the quality of those classes of iron must deteriorate, as the price obtainable for them must diminish. In respect to the relative price of iron and steel, Sir Alexander Rendel was quite right; but he himself now admits that in respect to their relative suitability for axles he was wrong, or, at any rate, premature. Commercial steel, when used in axles, seems subject to deterioration, which makes it very brittle after a few years' wear.—*Indian Engineering.*

TO PREVENT VIBRATION.—Many suggestions have been made for remedying the vibration and noise attendant on the working of the big engines which are employed to run dynamos. A plan which has given great satisfaction is to build hair felt into the foundations of the engine. An electric company has just had one of its 90-horse-power engines removed from its foundations, which were then taken up to the depth of four feet. A layer of felt five inches thick was then placed on the foundations and run up two feet on all sides, and on the top of this the brickwork was built up. The cost of the alterations was about $300.—*Safety Valve.*

SCIENTIFIC PROGRESS.

Electrical Progress

It is almost impossible to keep track of the wonderful strides that are being made in the application of electricity to the industrial arts. The mere figures connected with the enumeration are bewildering. We have already $500,000,000 invested in electrical appliances; and still, with all this investment of capital, we don't know what electricity is, or how it works. We only know that it performs work. We conduct it from point to point by means of a wire. How does it travel? We know it doesn't travel through the body of the metal as sound does. We don't know that it "travels" at all. We only know that it gets there. Many theories have been propounded, but none seems to meet all the conditions. Our

Views in this Regard are Constantly Changing

Dr. Louis Duncan has recently pointed out that, though the generally accepted views about an electric current have profoundly changed in the last two years, the new ideas have not spread very widely even yet. The old idea was that electricity flowed through a wire very much as water flows through a pipe; but the new idea is that the energy does not flow through the wire at all. The energy is actually transmitted by the ether outside the wire. In running a motor the energy used in running it does not pass through or on the wires at all, but passes from the dynamo at the electric-lighting station to the motor *through the ether* surrounding the wire. The wire acts simply as the core of a disturbance in the ether, making the transfer of energy possible, but not itself transferring it.

Electricity in Commercial Chemistry.

It would seem from recent developments that electricity is largely widening its range of usefulness, and gradually invading the whole domain of commercial chemistry. A factory for the manufacture of chlorate of potash by electricity has been erected in Switzerland; soda is being obtained by electrolysis of sea salt; the electric bleaching of paper pulp is now largely carried on in France, and now it is proposed in Germany to manufacture electric soap on a very extensive scale. The transformation of wood into paper pulp by the electrolysis of a salt solution into which sawdust or wood is immersed, has been proved to be practical, and steps are being taken for the establishment of the industry. The disintegration and the bleaching of the vegetable fiber take place at the same time by the action of the soda and the chlorine formed by the passage of the current. Some sugar works in Havana have recently availed themselves of electrical applications in the manufacture of sugar. The juice of the cane is poured into the middle compartment of a series of troughs, which are divided into porous partitions. The outside compartment contains water, in which are placed blocks of carbon connected to the negative pole of the dynamo. The positive pole of the machine is connected with carbon plates in the middle compartment. The sugar juices are purified from the salts they contain, which are taken up by the water. The addition of the current assists the osmotic transfer across the porous partitions. This method is said to effect a great saving in time and to produce superior sugar. We trust we are not going to have another "electric sugar" swindle!

Magnificent Possibilities.

Great as are the wonders which have been achieved by electricity thus far, there is good reason to believe that the possibilities of the future are still more magnificent. Some of the best engineers and electricians of the day think we may yet derive electricity directly from coal or heat. If that should be accomplished, the days of steam would be numbered. Another of the possibilities which has been suggested in connection with electricity is the

Production of Light Without Heat.

The result that would follow the production of light without heat by accomplishing a similar coincident vibration of etheric and magnetic waves by means of an electric current, would only be equaled by the dazzling rewards that await such a fortunate invention. Imagine, remarks the *Electrical, Mechanical and Milling News*, a luminous wire, carried the whole length of the street, giving out a soft and beautiful radiance, like the sun at noonday, instead of the isolated and alternating spots of light and darkness which are the results of the best systems of lighting in use today. Imagine it! No lamps to trim or intricate mechanism to get out of order, nothing but the cold and inminous wire shedding its radiant beams upon the darkened earth wherever it may be led. This and the production of electricity direct from fuel without the intervention of steam engine and dynamo, would be feats worthy of the brightest genius of this or any other age. The scientists at work on these problems may be a mile or two out of the highway to success just at present, but in the light of past discoveries it would be idle to say that it will not be accomplished.

Improving the Dynamo.

Great improvements are yet in store in improving the dynamo. It is a very remarkable fact, says the *Electrical World*, that in less than a score of years the dynamo should have reached so high a state of development that, so far as efficiency is concerned, there is little left to be done. The best dynamos, to-day, actually return as electrical energy more than 90 per cent of the power used in driving them. Much beyond this we cannot hope to go, for we have no material of infinite conductivity, no insulator against magnetism and no perfect lubricator. Even now, slight increase in efficiency is often gained at too high a cost in material and labor. But the dynamo is by no means perfect yet, and it behooves inventors not to sit down and wait for the much-rumored and never-seen methods of obtaining electricity direct from heat, but to sharpen their wits and go to work. And first of all, let them turn their efforts against that root of all electrical evil, the commutator. It has no virtues to speak of, and is a most fruitful source of trouble. We already have alternating dynamos quite free from its malign influence, and it is high time we had a continuous-current machine of a similar sort. The problem is difficult, it is true, but there is no reason to think it impossible, and we commend it to the attention of the inventors who now fritter away their talents devising crude and unusual forms of field magnets. The commutator must go.

THE FIXED STARS NOT "FIXED."—Science has proven, beyond a reasonable doubt, that there are movements among the fixed stars which will eventually break up and scatter the constellations as they are now mapped on our celestial charts. These constellations have been observed and mapped during a period of only about 4000 years. Careful measurements have been made during only one or two centuries; but enough has been learned in that short period to prove that the so-called fixed stars are not "fixed." One of the most notable instances of the constant and yet almost imperceptible changes taking place in the heavens is to be found in the motion of the seven bright stars collectively known as the Big Dipper. Huggins, the noted astronomer, is now engaged in proving that five of these stars are moving in the same direction, while the other two are moving in a direction directly opposite. Prof. Flammarion had reduced Huggins' calculations to a system, arranging them upon charts. These ingeniously constructed heavenly outlines show that 100,000 years ago the "Dipper" stars were arranged in the outline of a large and irregular-shaped cross; and that 100,000 years hence they will have assumed the form of an elongated diamond, stretching over three or four times the extent of sky now occupied.

NOT NEW.—It is an interesting fact that ice was artificially produced in India long before the invention of machines for the purpose. In the upper provinces water was made to freeze by exposing it during cold nights in porous vessels and bottles wrapped in a moistened cloth. In Bengal, shallow pits were dug and filled nearly full with dry straw, on which were set flat porous pans containing the water to be congealed. Exposed over night to a cool wind, the water evaporated at the expense of its own heat, and the consequent cooling took place with sufficient rapidity to overbalance the inflow of heat through the cooled air above, or the badly conducting straw below. Ice made in this way, however, was costly, and when, in 1833, natural ice was shipped from the United States to Calcutta, it was sold for half the price of the manufactured article. On the other hand, a machine shown at the Vienna Exhibition in 1870 made 30 cwt. of ice an hour, at a cost of 25 cents a cwt., and it is now asserted that ice can be manufactured on a large scale for less than $1 a ton.—*Ex.*

GAS AND ELECTRICITY.—We have already alluded to the fact that hydrocarbon vapor has been successfully burned in small electric arcs for the purpose of increasing the light at a less expense than would be required to increase the power of the electric current. The *Electrical Review* of London says that after a series of experiments this has finally been accomplished with excellent results and at a cost of not exceeding six per cent on the price of ordinary carbons, for about 1½ times the light furnished by the ordinary lamp. It is proposed to supply hollow carbons with the hydrocarbon attachment suitable for use in the lamps of any system, which certainly embraces a larger field than could be done with a lamp of special manufacture having this improvement.

ANCIENT HISTORY VIEWS FROM A CAR WINDOW.—A railroad in Asia Minor runs from Scutari to Ismidt, and will soon be finished 20 miles farther. This road is to be extended into India and will be the grand transdivisional line between Europe and Asia. It passes near the tomb of Hannibal. Nicomedia is a way-station, and from the car windows the ruined walls of Nicea are in view, where the first Christian council settled the creed. It crosses streams on repaired bridges that were built by Justinian, and altogether has a right of way through more ancient history than any other road on earth.

LEAF SODA.—At the Pechiney Works, at Salindres, France, caustic soda is now prepared for the market in leaves or flakes. This is effected by allowing the hot supersaturated liquor to flow from a funnel between hollow rollers, which latter are kept cool down to a low point by the circulation of cold water within them.

Shop Notes.

The Uncanny Mechanic. — Certain men who are trying to be mechanics are trying in vain. Now and then I see a man who botches everything he touches. Not long ago I was in a car-shop where one of these unmechanical mechanics was employed. My attention was attracted to his peculiar manner of doing things, and I soon saw that he was a man in the wrong place. He lacked the mechanical hand and eye. When he bored a hole through a stick, the hole was found to slant. When he sawed the end of a stick he left an end surface that slanted five or six different ways. When he tried to turn a handle, the "finished" articles coming from his hands were more like a corkscrew than a handle. When he tried to drive a nail, failure followed. It really seemed that he could split a heavy sill with a shingle nail, while the deft-handed man beside him could drive a railroad spike through a delicate veneer without cracking it. The unmechanical mechanic was destroying nearly everything he handled. All he seemed to be able to do was to sweep out, and even at that work he was likely to do some mischief. When a man of this sort has stuck to mechanical work long enough to prove his inability to do that kind of work well, he either ought to have sense enough to understand that he is at the wrong work, or those over him ought to suggest to him a change of occupation.—*Ex.*

A Fire and Heat Protection.—Asbestos is now being extensively employed for protection purposes in workshops, foundries and mills to guard against the danger of burning the hands and face and generally to make work in hot metals a safer and more comfortable occupation. Asbestos mittens to guard the hands are made for firemen, assayers, refiners, etc., and armed with a pair the artisan or workers can grasp hot irons, crucibles and the like without discomfort. Masks, too, for the face are made of asbestos, which are fireproof, and the heat from the hottest fire is said not to penetrate to the skin. Air is drawn beneath the mask for breathing, so that the flame and smoke-laden atmosphere is not inhaled. Aprons and insulator coverings for the entire body are also constructed, having like protective qualities, and for firemen complete suits of asbestos fireproof cloth are made. In a smaller way and for domestic use, sad-iron holders of asbestos may be had, and with these the grasp of the iron, however hot it may be, never causes pain or burning. Plumbers are likely to welcome asbestos cloth for joint wiping, and larger holders intended for use by smelters, molders, and workers in metal generally, are among the more recent uses of this mineral.

Oil in the Factory.—A cotemporary urges upon those in charge of machinery to use good oil and to use it carefully. It says: Using good oil and using it freely may be all well enough where every drop is filtered and used over again, but it is a shame to see even poor oil soaking into the floors and floor beams. What is to be done? Set each machine into oil trays and soak up the drip with a sponge? On machines where clock oil is used they never have trouble in this respect; and when a bearing shows signs of running down it is said to be oiled too much. Where a bearing is properly proportioned it is doubtful if the drip would be any more than could be gathered on the cleaner's waste; and yet every bearing that offers a good chance for an oil can must be kept on the drenching drip continually. A superintendent of a shop in showing up the beauties of the indicator, finds that its greatest value is in being able to tell the best kinds of oil to use on his line shafts. He has at least noticed a great difference between the good and bad running of his power-transmitting machinery. A loss in friction must be generating smoke somewhere.

Mechanics Who Read.—An employer once requested his foreman to go round among the men in the shop and advise them to make up a club to take several mechanical papers. The men did so, and when the papers came and had been read, the dinner talk of the men took a new turn. The articles in the several papers were discussed, and as a consequence a new zest was given to their work. They took more interest in it. They thought and talked about it, and studied it. Those men soon became better mechanics, and it is from such persons that foremen and shop-owners and successful men are graduated. A mechanic must be a constant reader and student if he would become a man of mark in his calling.

The Velocity of Shafting has been much increased within the past 20 years. Old mills and shops, as a general thing, are not, as a rule, so strongly put together as to withstand the vibrating motion consequent upon high speed. But when they are, great economy is found in this increased rate of speed, and new mills as a general thing are constructed with special reference to high speed. Shafts carrying 36-inch pulleys are now run as high as 350 revolutions without vibrations in any way injurious to the best working of the machinery or whatever kind of work may be carried on.

Color in an Engine-Room.—Paint the pulleys and moving parts vermilion, the body a dark green, and the hangers a brown, the brick walls being whitewashed. The effect of a line of bright pulleys in motion is very pleasing. We believe in the use of bright paint in an engine-room, and vermilion and green are very lasting colors.—*Boston Journal of Commerce.*

There are 445 complete rolling-mills and steel works in the United States, and 11 in course of construction.

Good Health.

The Injurious Effects of Railway Whistles Upon the Hearing.—An eminent Glasgow aural surgeon, Dr. Thomas Barr, has communicated to the British Medical Association some valuable data concerning the injurious effects of railway whistles upon the hearing. In railway whistles the arrangement for regulating the pressure of steam passing through from the boiler to the whistle is not usually sufficiently delicate. If the boiler should be under high pressure, the whistle is very much louder and shriller than when it is under low pressure; so that when a passenger train is leaving a station for a long run, and having therefore its boiler under high pressure, the whistle is unnecessarily loud and shrill, just when those qualities are least required. Dr. Barr urges upon the attention of the association the adoption of lower pitched whistles, with proper regulators, so as to lessen the present jarring of sensitive ears and nerves. The question of whether a whistle of lower pitch than that usually employed would be as efficient as an acoustic signal is said to have been solved by the introduction on a Scotch railway of a new form of whistle, very much resembling an organ pipe. The steam is forced on the lower edge of a brass tube closed at the upper end, and the sonorous impulses are taken up by the current of air in the tube and immensely reinforced, the pitch depending upon the length of the tube as well as upon the force of the blast. The sound resembles very much a steamboat whistle, being loud and much lower in pitch, and, therefore, less painful to the ear than the ordinary railway whistle.

Heat and the Growth of the Hair.—It is generally understood that the hair and nails grow faster in hot weather than in cold, but perhaps few are aware that any temperature can impart so great a stimulus to the growth as Colonel Prjevalsky, the Russian traveler, says the Central Asian heat did during his journey in those regions during the summer of 1889. In June the ground and the air became excessively hot, so great, indeed, as to render travel in the daytime impossible. Within a fortnight after this oppressive weather began it was noticed that the hair and beards of all the party were growing with astonishing rapidity, and, strangest of all, some youthful Cossacks, whose faces were perfectly smooth, developed respectable beards within the short period of 20 days.

A Wise Precaution.—A firm of chemists in Birmingham, Eng., placed upon all poisons sold by them directions as to the antidote which should be applied in case where the poisons are taken accidentally or intentionally by human beings. An English chemical journal gives an instance where this precaution was the means of saving life. A woman poisoned herself and then informed her husband that "she had done it." A medical man was at once sent for, but in all probability the woman would have been dead before he arrived but for the fact that her husband chanced to read on the label which accompanied the poison the instructions: "Give a mixture of chalk and water, milk and magnesia or carbonate of soda and water until medical aid can be procured." The result is that the would-be suicide is alive to-day.

Consumption.—At the recent International Medical Convention held in Berlin, Dr. Koch, the best authority on bacteriology, gave a very interesting address on that subject. The new points touched upon were some observations on tuberculosis as observed in the fowl, and on the possible curative treatment of consumption of the lungs by drugs. In a series of experiments which he lately conducted, he found that certain bodies, such as volatile oils, and certain metallic salts, such as nitrate of silver and preparations of gold, even in very small doses (1 to 1,000,000 and even less), destroy the tubercle bacilli in a very short time, and thus he believes that it is not impossible that in the course of time some drug may be found which will effectively destroy the lung bacillus without injuring the body.

High Heels and Nervous Prostration.—Physicians say that cases of nervous prostration are less frequent since low heels have come into fashion. They allow the whole weight of the body to rest on the feet, remove the tension to which the muscles are subjected by high heels and keep the calf of the leg in its normal condition.

Go to Bed at Night to Sleep, not to think over the troubles of to-day nor the anticipated trials of to-morrow. One woman said: "I plan my next day's work each night after retiring." Poor, little, nervous thing; she looked it.

The Latest Adulteration.—Cinnamon is said to be adulterated with old cigar-boxes ground up into dust.

Useful Information.

A Coal-Waste Commission.

The Pennsylvania Legislature has appointed a commission to look into, as far as possible, the waste of coal at the mines, and to devise the best practicable methods for utilizing the waste already piled up in the culm heaps. The commission is just now entering upon its work. We learn from a contemporary that investigations will be made as to the underground waste of mining, also the waste of preparation, including all processes in which the commercial size has been continually reduced, the amount of culm in sight at place of preparation, and the annual product of culm.

In regard to the utilization of coal-waste the commission will examine the briquette system, and secure recorded tests under responsible supervision, patent-office records, specimen forms and chemical analyses. The records will be thoroughly searched for information relative to all the practical mechanical appliances by which the waste is utilized without mechanical preparation, such as devices for furnaces, grates, blowers, etc., and an examination will be made of the gasifying processes by which coal-waste is utilized in the manufacture of fuel gas.

The work laid out by the commission is of great importance to the coal interests of not only this State, but the entire country. The waste entailed in our present methods of mining and handling coal is such as to engage the serious attention of those interested in the material wealth of our State, and the huge piles of culm which disfigure the face of nature in the anthracite regions show how great has been that waste.

Recently, means have been taken to utilize a considerable part of the waste, and the anthracite operators are realizing that wealth is stored in the culm banks which they have heretofore regarded as an entirely useless product. The commission asks those qualified to answer that all available information will be given, and that every means of making their investigation thorough and effective will be extended by those connected with the coal interest.

The Stick of Wood in the Barrel.—A correspondent of the *Practical Mechanic* writes that he has tried the experiment which has been written about in the press of late, of inserting a stick of wood in a barrel or hogshead of water to prevent its bursting when frozen, and has found it an effective remedy. He says he had no faith in the success of the experiment, but decided to risk one barrel, so inserted a stick about 4x3 inches and let the barrel freeze up solid, and much to his surprise the barrel was uninjured, the ice bulging up around the stick, but not a stave or section of the head started. This is a valuable thing for all to remember.

Test for Lead in Block Tin.—An optico-chemical method by which the presence of lead as an alloy of block tin may be speedily ascertained without injury to the siphon or other article constructed thereof, has been discovered by a German chemist. Ten milligrams of the suspected metal is scraped off, dissolved in nitric acid, and the solution made strongly alkaline with caustic potash. If this solution turns dark-brown on the addition of sulphureted hydrogen water, it contains lead. By making it exactly as above, diluting and comparing it with an accurately titrated solution of pure lead, one per cent of the alloy can be detected with certainty after a little practice.

Mosquitoes Hate Oil.—"Wherever you find petroleum you won't find mosquitoes," said an old oil-country man. "The insects can't stand the smell of the grease, and wherever oil wells are plenty there is no call for mosquitohars. Over and over again I've seen mosquitoes cleared out in a new oil-field as soon as a well flows. Whether petroleum, applied to the hands and face, will drive off mosquitoes I don't know, but one of the few compensations of the driller is that he is seldom troubled with mosquitoes."

Tool Handles from Compressed Paper.—A firm at Dresden is now successfully manufacturing tool handles and shafts from compressed paper chemically prepared. They are very hard and firm and have the additional advantage of being non-conductors of heat. Another German firm is making pulleys of pasteboards pressed by hydraulic power, having an iron core and strong casing. They are supposed to take up less room, generate less friction, and are waterproof.

Tough Paper.—Paper tough as wood is said now to be made by mixing chloride of zinc with the pulp in the course of manufacture. It has been found that the greater the degree of concentration of the zinc solution the greater will be the toughness of the paper. It can be used for making gas-pipes, boxes, combs, for roofing, and even, it is added, for making boats.

There are 32 compositions on the market to prevent submarine growths on iron ships, and none of them do the work.

A Device of questionable value has been suggested in Australia for the prevention of a certain class of railroad accidents. Glass tubes project before the train, and if they are broken by an obstacle an electric movement is applied to the brake, bringing the train immediately to a standstill.

Steam Boiler Notes

The Steam Loop.

A New and Valuable Invention.

The steam loop is a recent American invention, and a device which has been brought into use for the purpose of returning to the boiler the water of condensation. It is an invention of great practical value and of extreme simplicity. It is so simple, indeed, that the wonder is that no one has thought of it before. It was thought out by a practical mechanic and not by an engineer, from whom such a thing would naturally be expected to emanate.

The office of the steam loop is to cause condensed water from steam pipes or from an engine to flow back into the boiler, when the latter is at a higher level than the former, and it performs this office without the aid of any moving parts.

It is a fact well known to steam-heating engineers that when steam is flowing through a pipe it carries along with it the water of condensation, generally in the shape of a thin film on the surface of the pipe, or, when a greater amount is present, in the form of short slugs or pistons, which are pushed along by the flowing steam. The working of the steam loop is dependent upon this fact, and also upon the fact that in any closed system of pipes filled with steam the lowest pressure is found at dead ends toward which, therefore, a continual flow of steam is maintained.

In practice, heretofore, the water of condensation in steam pipes has been intercepted by "traps" and returned to the boiler by pumping. By means of the steam loop, however, a simple pipe only is necessary to do this work.

We copy the description of this device from *London Iron*, which paper gives due credit for the device to the American inventor, Mr. Barnham:

"The steam loop is formed by placing a separating chamber on the steam pipe near the engine. Into this chamber the water of condensation flows, and nothing but dry steam passes into the cylinder. From the separator the water is forced by the pressure of steam behind it up a vertical tube into a horizontal one, which again becomes vertical, returning downward. The bottom of this pipe is connected with the boiler, a valve opening inward being placed at the junction of the two. The condense water gradually accumulates in the 'drop-leg,' as it is called, and as soon as the weight of the column, plus the pressure of steam on the top of it, is sufficient to overcome the boiler pressure, an inrush of hot water into the boiler takes place. Directly the pressure in the steam loop is reduced below that in the boiler, the valve closes and the condense water goes on accumulating until it once more overcomes the boiler resistance, when another charge of water is delivered into the boiler. It will thus be seen that this constitutes a perfect circulating system, and advantage is taken of this for heating and drying purposes. The steam loop is said to be largely in use in America with excellent results, effecting great fuel economy. It is being introduced in this country by Mr. John Gillespie of Leadenhall street, London. We understand that a steam loop has been fitted up and is in successful operation at Messrs. John Penn & Sons' works at Greenwich, and is also being adopted at a number of other large works."

The *Engineering News* of New York, in commenting upon this invention, says: It is plain that the steam loop is a perfect substitute for the steam trap or steam pump as a means of returning condensed water, and vastly more economical from every point of view. It is in fact so simple, efficient and inexpensive a device that it will pay to apply it to thousands of steam-heating systems, steam jackets and engines, where now the condensed water is wasted.

It is a fact which cannot be too strongly impressed upon every steam-user and every mechanical engineer working with steam, that dry steam and the immediate return of condensed water to the boiler are of great importance as regards fuel economy. The large percentage of water contained in the steam taken from an ordinary boiler is not generally realized. Steam-separators have of late become common for attaching to an engine to insure dry steam; but if, as is often the case, the condensed water from them is wasted, the heat contained in it is a total loss. It must be a very small plant, using very inexpensive fuel, in which the economy secured by the use of a separator and steam loop will not pay their entire cost in a few years or often in a few months.

In the case of heating and drying pipes, too, the use of the steam loop makes every plant practically a gravity return system, whose economy and simplicity in operation over any other system are well known.

Patents for the steam loop have been secured for the United States and foreign countries. Messrs. Westinghouse, Church, Kerr & Co. of New York control the United States patents; and since they put the invention on the market, about two months ago, over 200 of them have been put in operation.

The Mechanics' Fair of 1890.

See Advertising Columns.

Passing Events.

The Mechanics' Institute Fair opened this week, and although exhibits have been somewhat delayed, it promises to be one of the most successful ever held here. The officers have arranged for as many novelties as possible.

There is no change in the situation of the local strike of iron-molders. A few of the men have returned to work, but the large body is still out. The shops, while somewhat inconvenienced, have men enough to do necessary work.

The Columbian World's Fair Association of California has been organized, and an executive committee appointed to attend to details of the organization. There is one member from each county of the State, so that it is probable California will make a very good showing.

The movement in Congress to arrange about mineral lands and railroads, and to permit the cutting of timber for mining purposes, is a good one, which will result in great benefit to the mining industry.

A PORTLAND mill company received an order recently from Hongkong for $20,000 worth of spars. The bark Coloma is now loading them. They average 100 feet long by 32 inches in diameter, and are suitable for the lower masts of big ships.

The Silver Situation.

In our last week's editorial on the workings of the new silver law, it was given the caption "Failure of the Silver Bill," that more decided attention would be drawn to the status of the market. So far as lifting prices for the metal from the low rut into which they had drifted, the bill has proven a success and has greatly benefited the mining industry; but so far as freeing it from speculative influences by bringing the price to par with gold, or keeping it from decided fluctuations, the bill is a failure. Miners, farmers, laborers, and fully three-quarters of the business men in this country are now favorably disposed to bimetallism and would hail with unmistakable pleasure the passage by Congress of a free-coinage bill—a bill placing gold and silver on the same footing.

The favorable effect of the present bill is witnessed in renewed activity in deep-mining districts. This is evidenced in the increased sale of mining machinery. Yet it is affirmed that the silver output will not show any marked increase. This opinion is grounded upon the well-established fact that in the large silver-producing district of Virginia City the ore is running more to gold, which causes many experienced miners to be outspoken in the belief that at an early day the percentage in gold will be from 75 to 90 per cent, which is quite a difference from what it formerly was, for up to a year or so ago the percentage was from 60 to 85 per cent silver. In mining districts where work in many old mines is resumed the ore is either low-grade or else the vein is narrow, so that the output will not be largely increased from this source.

The unfavorable effect of the bill is witnessed in the widely fluctuating prices of silver, which gives to speculators a firmer, better basis for speculating in that metal and all commodities and securities whose market values are hinged upon its price.

This country wants more money. With a population nearly as large as that of both England and France, yet our money circulation is far below the latter's. While France with her large moneyed wealth is free from financial panic, ours bid for them, for by a bold concerted movement of speculators a panic can be brought about at almost any time. This is clearly shown in the later panicky feeling at the East, which was only averted by the prompt action of the Treasury and the strong probability that the Tariff bill will not, if it becomes a law, go into effect previous to the beginning of 1891. Had we free coinage the price of silver would be at par and very large sums of money invested in silver would have been in circulation.

The Eastern stringency was produced by the scare that large sums of money would at an early day be required to withdraw foreign goods from bonds before the Tariff law went into effect. This expected demand for many millions of dollars coming on a large demand to move the crops of the country, particularly that of cotton, which is the largest in the history of the country, was enough to start a serious money panic when it is a well-established statistical fact that there is hardly enough money in circulation in this country to meet the current requirements of trade.

The Coming World's Fair.

Although there is still trouble about settling down upon a site for the World's Fair in Chicago, the people are assured that this local quarrel does not retard other arrangements which are going forward. However this may be, the Pacific Coast people are proceeding with preliminaries. The general convention in this city last week was quite fully attended, and after a day's discussion intrusted the subject to an Executive Committee, which has organized and begun work. The State has been divided into 13 districts outside of San Francisco. There will be eight members from San Francisco and one from each of the outside districts to form an Executive Committee of 21. This committee will have charge of the work of preparing the California exhibit for the World's Fair. It is the intention to ask an appropriation of $1,000,000 from the next Legislature of the State to enable the work to be carried on properly. There is a proposition on foot to make a combined exhibit of all the Pacific Coast States, instead of having the product of California separate. This proposition will be discussed, but the opponents of the measure are apparently largely in the majority.

His Golden Opportunity.

In another department is printed a communication from J. H. Tingman, vice-president of the Mining Stock Association, criticising the position of Virginia papers on the subject of the milling of Comstock ore. Mr. Tingman gives figures which challenge attention. If they are wrong, then the directors and superintendent of the Hale and Norcross mine owe it to themselves, if not to stockholders, to bring libel suits against the authors of the charges. If they are correct, then the sooner those who are guilty of the wrong acts are ousted from their places of trust and made to pay to stockholders all deficits or funds wrongfully appropriated, the better will it be for the mining industry on this coast, but more particularly in Nevada.

When charges against the Hale and Norcross management were first published, there were many who did not give credence to them; but under repeated charges, with the last stronger than the first, their faith is being shaken, and unless those against whom they are published take steps to prove themselves guiltless, the shaken confidence of the public will give way to a certainty of belief that the charges are founded upon fact.

With a lack of confidence in the manner in which the Comstock mines are worked, it will take much for its removal so as to bring in a desirable class of outside buyers of mining shares. There are many who expect to have this brought about by a change in the management of the mines, by action at law, or else by having the attention of the leading capitalists, who are supposed to have interests in Nevada mines, attracted to the situation, with the view of bringing about desired reforms.

There are those who look to Francis G. Newlands as being more likely than any one else to look into the workings of the particular mines he is supposed to control in the interest of the Sharon estate, and bring about needed reforms. In this opinion, they are strengthened from the well-known fact that he has identified himself with the undeveloped resources of Nevada, which promise to make, before many years, that State noted for agriculture as well as mining. The steps he has already taken to develop the latent industries of the State are a wide departure from those of other citizens of Nevada who have been made millionaires by its mines.

Mr. Newlands has already given evidence of a desire to right any wrongs to which outside stockholders in the mines controlled by the Sharon estate have been subjected. This is witnessed in his action regarding the mill contracts of the Yellow Jacket mine. He not only had the contracts stopped as soon as he discovered that they caused the mining shares to be assessed while the company was milling ore taken from the mine, but we are credibly informed he canceled the company's indebtedness—about $200,000—when he ascertained that the said indebtedness was incurred for milling and mining rock that would not pay. For this generous act he deserves the cordial thanks of all outside shareholders. Not only was the milling contract stopped, but he reduced milling charges to $6 a ton—another act in behalf of stockholders. His good work should not end here. Now that he has his irrigation schemes and other beneficial acts well under way and no silver legislation to engage his time, he should give attention to the mine assays, car-sample assays, as well as battery assays of each and all the mines under his control. This is what the law requires (Mr. Newlands, being a lawyer, knows this to be true) and which given will disarm criticism. Not only should he see that the above is done, but more than this, he should open out the body of ore lately found in Confidence 40 feet north of the Yellow Jacket line on the 800-foot level, of which he must surely be informed by this time.

Mr. Newlands is a new mining magnate on the Comstock. He is in no way responsible for the past acts of other people, and should he judged by the stockholding community only for his own acts. Now is his golden opportunity to right the wrongs of the stockholders and at the same time do justice to himself.

We are informed that a majority of the Mining Stock Association are stockholders in the Gold Hill mines, some owning several thousand shares, and are in reasonable hopes of the much-needed reform being inaugurated there. Mr. Newlands is certainly in position to carry out these ideas, and it is to be hoped that he will see the necessity of continuing the reform started by himself in the Yellow Jacket mine and let the adjustment of affairs extend to all the mines under his control.

Corn Palaces.

The Corn-Palace idea originated in Sioux City, Ia., and at that place all the palaces have been erected. A Corn Palace is covered and embellished, as with tapestry, outside and inside, with products of the field, corn predominating, ingeniously and fancifully arranged. In building the palace a large structure is first erected of lumber, of a shape that will carry and show to advantage the multiform decorations with which it is to be adorned. It is in form lofty, with broken lines, pinnacles, buttresses, bridges, gable, ornamental window, etc. Over every inch of this wooden surface are laid corn and kindred plants in architectural harmony, in a multiplicity of designs. The corn is employed in the stalk, the ear, the kernel, and even the husk has its decorative uses. All the grains and grasses of the field lend themselves to the beautifying of the palace. The walls are covered on the outside with ears of corn, cut lengthwise or crosswise, and nailed on in geometrical figures or other designs. The various colors of the cereal permit of a wide range of shading and coloring, while its artistic possibilities, developed from year to year in building the palace, admit of the production of effects that are as startling as pleasurable.

The Corn Palace of 1890 is to be 264 feet square, or more than twice as large as last year's Palace, which was 120x240. The central building will run up to the imposing hight of 172 feet, the upper 100 feet being a dome. This main building will be in the form of an octagon 166 feet across. In the center will be an open space 78 feet across, without a post or anything to interfere with a view of the whole interior decorations. This space will run up 66 feet with an artistically painted sky at the top, studded with stars of incandescent electric light. The gallery in the Palace will be clear around the interior of the rotunda, 44 feet high, and will be 25 feet wide. This gallery will give every one an opportunity to see all there is to be seen, and it will be adorned with various exhibits as well as overlooking all the rest of the palace.

East of the main building, opening into it by two gates, will be an auditorium to seat 1000 to 1300 people. The band-stand will be between this and the rotunda, so that the music may be heard by every one in the Palace.

At the north of the main building will be another lower structure running back 100 feet. This building will run around back of the main building to connect with the auditorium, and will be 100 feet deep clear around, roofed and concealed by a battlement. There will be grottoes, beautiful and original ideas worked out in corn and showing the wealth of the great agricultural Northwest as well as the ingenuity and artistic taste of her people. One of the wonders in preparation is a miniature Niagara Falls, located so that it will be the first thing to greet the eye of the spectator as he enters the building. Here he will look down to the farthest part of the great structure, 272 feet from the main entrance, with an uninterrupted view 48 feet wide and 44 feet high. The space of one side of the octagon, 48 feet, which is the entrance to the back part of the palace, will be crossed at the gallery floor by a rustic bridge, from which all parts of the palace may be seen.

The decorations this year, both interior and exterior, will be projected on a scale grander and more elaborate than ever before. The exhibition will open September 25th and continue until October 11th.

Academy of Sciences.

At the meeting of the California Academy of Sciences on Monday evening last, a donation was received of a specimen of wood, compressed from its former diameter of 14x14 inches to about three inches by the force of rocks in the Consolidated Virginia mine.

A paper by Mrs. Theodore H. Hittell was read by her husband. The paper called for the better preservation of the hieroglyphics on the rocks for the purpose of ethnological study. A number of examples were given of the pictures on the rocks.

Dr. Gustav Eisen, in speaking on the subject after the paper was read, said that there were several thousand such inscriptions in San Luis Obispo county in a cave, and others in Santa Barbara and Tulare counties. He moved that a committee be appointed for the purpose of preserving the remains of Inscriptions. The motion passed, and Messrs. Eisen, Hittell and Rixford were appointed.

Charles Keeler read a paper on the distribution of the English sparrow and its menace to the crops.

Horticultural Art iu California.

It is perfeotly natural for persons living at a dlstance from the Pacific Coast to imagins that the finer horticnltnral art is hnt orndeiy represented here. While this to an extent is trne, as is the oase in all new and doveloping oonntries, it is nevertheless a fact that we have many examples of landscape and arohiteotural effects that for originality and beanty of conception will rival those of any oonntry.

Of the many princely places around the San Francisco bay, none are more worthy of mention than the gronnds of Capt. J. C. Ainsworth, at Claremont, Alameda county, a few sketches from which have been combined in the engraving on onr first page. The snmmer-house in the foreground is unique and original and makes a delightful evening resort. The onter surface of the shell is of beaten copper plates; the interior was shaped with patent sheathing laths, which are covered with cement, finished in gold-bronze and sea-green; the floor is of polished black cement blocks. Capt. Ainsworth's conservatories, only one of which is figured, compare favorably in design and collection of plants with any in the oonntry. The fountain challenges the admiration of the most critical artist. The effect of the covered driveway approach, with its arrangement of vines and trees, is worthy of note.

Of the terraced rockery and caverns, it is impossible to give a comprehensive idea. The arrangement is a series of fern-lined caverns, with an interior fountain, the walls composed of many-colored stones, the exterior with evergreen foliage plants, brilliant mesembryanthemums, etc. Another pretty effect is found in a secluded nook of the captain's spacious grounds; surrounded by a group of weeping trees is an immense mass of *Agapanthus Umbellatum*, in which is imbedded a large stone-rimmed water basin. The effect when the Agapanthus is in bloom is something wonderfully beautiful. Mr. John McCullum, who has the grounds in charge, has in contemplation many attractions.

The fine residence of Captain Ainsworth, valued at some $80,000, was burned on Wednesday, with its fine pictures, statuary, bric-a-brac and elegant furniture; very little of the contents being saved. The conservatories, however, did not take fire, though the stables were burned.

Of other California horticultural masterpieces, it may be remarked that the conservatories, terraces, etc., at Golden Gate Park are in many respects unequaled in the United States. Many illustrations could be given of modern horticultural structures, both commercial and private, and of growing places, designed and planted by our California gardeners, of which our Eastern friends may with some excuse feel envious.

It is not conceit to anticipate for California a most remarkable development in ornamental horticulture. With an unparalleled soil and climate, an immense number of adaptable plants with which to work, and an enterprising people imbued with the spirit of ornamentation, there is no reason why our gardens should not be the envy of the world.

SCENES ON THE GROUNDS OF CAPT. J. C. AINSWORTH, CLAREMONT, ALAMEDA COUNTY, CAL.

The Late John Cribbins.

A well-known and very skillful miner was John Cribbins, who died at the Deadwood hospital near Oroville, Butte county, on Saturday. He has done much important mining work on this coast, especially in large tunnel operations. His first work was on the Hoosac tunnel as a day laborer, where he remained until its completion, when he came to California. He soon after went over to Nevada and began work on the Sutro tunnel, where he remained four years and was then offered the position of foreman of the Guadaloupe quicksilver mines. From there he went to the Sheep Ranch mine in Calaveras county. He was subsequently foreman of the Blue Tent and other mines near Forest Hill. The Richman Rock Drill Company afterward employed him to set up their machinery in different sections of the country. After finishing the big tunnel on the Oregon railroad he came here again as foreman on the Big Bend tunnel, Butte county, where he did excellent work.

About three years ago he was called to South America to work at El Callao mine. He was finally obliged to give up the place on account of the inroads made on his health by the climate. He never recovered from the effects of the trip. His physicians here told him he must leave the city if he hoped to prolong his days. As he had always enjoyed good health near the Big Bend tunnel, he went to that vicinity. He found positions with the Golden Gate mine and the Folsom dam.

In spite of his best endeavors his health failed rapidly, and at last he was obliged to go to the Deadwood hospital for treatment. Deceased was 45 years old and leaves a widow and four children—two girls and two boys.

Le Roy, Arizona.—The growing and important camp of Le Roy adjoins the Vekol mine and townsite. The townsite of Le Roy was laid out over two years ago, and a correspondent informs us that the product of the camp has been $2,000,000. He says that the camp is, outside of Silver King, the "banner" one of the Territory, which the record of shipments proves. It is growing rapidly in importance and is a good field for investment and capital.

Solomon Heydenfeldt, a lawyer who has made mining practice a specialty for many years in this State, died in this city on Monday. He was Judge of the Supreme Court from 1851 to 1857. Judge Heydenfeldt has been legal adviser for many mining companies for years, and has conducted a great number of important mining suits.

SOME CHOICE TECHNICAL TREATISES!

ANDES.—A Practical Treatise on the Fabrication of Volatile and Fat Varnishes, Lacquers, Siccatives, and Sealing Waxes. With additions on the application of Varnishes, Stains for Wood, Horn, Ivory, Bone, and Leather. Edited from the German by W. T. Brannt. 11 illustrations, 346 pages, 12mo. Price.....$2.50

BAUERMAN.—A Treatise on the Metallurgy of Iron and Steel. Sixth edition, revised and enlarged. Illustrated, 523 pages, 12mo. Price.....$2.00

BIRD.—The American Practical Dyer's Companion. Embracing in all over 800 receipts for Colors and Shades, accompanied by 170 dyed samples of raw materials and fabrics. 388 pages. Price.....$10.00

BRANNT.—A Practical Treatise on the Raw Materials and the Distillation and Rectification of Alcohol, and the Preparation of Alcoholic Liquors, Liqueurs, Cordials and Bitters. Edited from the German by W. T. Brannt. 31 engravings, 330 pages, 12mo. Price.....$2.50

BRANNT.—A Practical Treatise on Animal and Vegetable Fats and Oils; comprising both Fixed and Volatile Oils, their Physical and Chemical Properties and Uses; the manner of Extracting and Refining them, and Practical Rules for Testing them, as well as the Manufacture of Artificial Butter, Lubricants, including Mineral Lubricating Oils, etc., and on Ozokerite. Edited from the German and other sources by W. T. Brannt. 240 engravings, 730 pages, 8vo. Price.....$7.50

BRANNT.—A Practical Treatise on the Manufacture of Soap and Candles; comprising the Chemistry, the Raw Materials, the Machinery and Utensils, and Various Processes of Manufacture, including a great variety of formulæ. Edited chiefly from the German by W. T. Brannt. 163 engravings, 677 pages, 8vo. Price.....$7.50

BRANNT.—A Practical Treatise on the Manufacture of Vinegar and Acetates, Cider and Fruit Wines; Preservation of Fruits and Vegetables by Canning and Evaporation; Preparation of Fruit Butters, Jellies, Marmalades, Catchups, Pickles, Mustards, etc. By W. T. Brannt. 79 engravings, 479 pages, 8vo. Price.....$5.00

BRANNT.—The Metallic Alloys: A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with the Coloring of Alloys, etc. Translated and edited chiefly from the German by W. T. Brannt. 16 engravings, 428 pages, 12mo. Price.....$2.50

CREW.—A Practical Treatise on Petroleum: Comprising its Origin, Geology, Geographical Distribution, History, Chemistry, Mining, Technology, Uses and Transportation; together with a description of Gas Wells, the Application of Gas as Fuel, etc. By Benj. J. Crew. With an Appendix on the Oil Regions and the Geology of Natural Gas in Pennsylvania and New York. By Charles A. Ashburner. 70 engravings and two plates, 508 pages, 8vo. Price.....$5.00

CRISTIANI.—A Technical Treatise on Soap and Candles. By R. S. Cristiani. 176 engravings, 581 pages, 8vo. Price.....$7.50

CRISTIANI.—Perfumery and Kindred Arts: A Comprehensive Treatise on Perfumery. By R. S. Cristiani. 398 pages, 8vo. Price.....$5.00

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 18, 1890.

The past week bas exbibited continued activity in general trade. The demand is for full assortments, chiefly for winter stocks.

The money market is easy under liberal remittances and general confidence is felt in the future. The call for crop purposes begins to slack off.

MEXICAN DOLLARS—The market has held steady at from 91@92 cts., with a stronger tone at tbe close. The general belief in higher prices for silver causes the strong tone for Mexicans.

SILVER—The market bas held to firmer figures, with a slight advance toward the close. The unsettled money market at the East was taken advantage of by speculators, and under a scare the price of silver was sent down far below its value when is taken into consideration the large quantity that the Treasury has to purcbase, with no material increase in the output of the mines. The Mint's counter rate in this city has ruled at $1.15¾, but at the close a bigher figure is expected to obtain. The Department at Washington bought as follows: On Sept. 12th, 321,000 ounces at $1.156@1.157½. The offerings aggregated 431,000 ounces. On Sept. 17th the offerings were 519 000 ounces, and purchases 326,000 ounces at from $1.16¾@1.16¾.

QUICKSILVER—Receipts tbe past week aggregated 446 flasks, and exports by sea 14 flasks to Panama. Tbe market is reported easy. The coast demand is said to be fairly good.

ANTIMONY—The market is weaker. Buyers are more disposed to obtain concessions before anticipating their wants.

LIME—Receipts the past week aggregate 6613 bbls., and exports by sea 300 bbls. to Hono'ulu. A slightly better demand is reported. The Hawaiian demand will soon set in more actively.

BORAX—Receipts tbe past week aggregate 715 centals. The overland shipments in last month aggregate 3325 ctls. The market is barely steady, notwithstanding the free shipments to the East.

LEAD—Tbe market is quoted at another advance, with a strong tone at the close. Witb another advance in the European markets, American markets are below the English parity. The demand is said to be slow, yet the market goes up under strong boldings.

TIN—The market for pig has gained another point, under stronger markets abroad. Tin plate is firm, but quotations are unchanged. It is reported that more is doing in future delivery. Cablegrams to the *Iron Age* report as follows:

Block tin prices bave steadily advanced and reached £98 15s. under the influence of large demand for prompt and near delivery. Recent arrivals have fallen behind the consumptive requirements, and the decrease last month of 600 tons in the visible supply has been further enlarged.

COPPER—The market has held to strong prices, but with no advance established. It looks as if American copper-mining companies will not attempt to squeeze up prices, being content to let well enough alone. The European markets are firmly maintained. New York mail advices to September 12th report as follows: Several small outside lots of Lake Superior ingot, probably 100,000 lbs., all told, have been picked up the past week at 16¾@16¾c. These purchases, it is believed, have absorbed about all the weak outside holdings. The mining companies are firm at 17c for either prompt or near future deliveries. Arizona ingot remains at 15¾@15½c, and common casting brands are quoted at 14½@14¾c, with the market showing rather better tone.

IRON—The market is steady at quotations. The quantity going into consumption is larger than at this time in 1889. The East reports a firm market, while English advices report an easier tone.

COAL—Imports the past week aggregate as follows: Comox, 2350 tons; Seattle, 5241; Coos Bay, 1150; Departure Bay, 700; Nanaimo, 3695; Tacoma, 1000; total, 14,136 tons. The market is very strong for steam in all positions. The absence of supplies from the Wellington mines and only moderate imports expected from Australia are the strong factors in favor of sellers. Puget Sound collieries are increasing their output. Large dealers are looking for higher prices when the cold weather sets in. The tonnage on the way from and loading at Australian ports is as follows: Newcastle, N. S. W., 52,571, register, and Sydney, 6681 tons' register; total, 59,272 tons' register.

Mining Share Market.

The mining share market bas been dull in the leading Comstocks, but fairly active in the smaller stocks witb Andes quite active—jumping around like a fish out of water. While the leading Comstocks were dull, there was a strong tone with unmistakable evidences of an up market. The slight but steady advances witb setbacks in the higher-priced stocks, while the "cats" move more quickly, are accepted as favorable signs. Money will soon be very easy and besides there will before long be many hundred laborers in the city, returned with money from their summer work. They will have money and will, of course, try to beat inside manipulators by speculatiug in stocks. Their buying ought to cause better prices, if nothing else will.

In outside mining sbares, trading has been more lively in the Quijotoas and Tuscaroras. Tbe Bodies have dragged, owing to a pending assessment on Mono and reports that Bodie must come lower before going up.

From the Comstock mines there are confirmed reports of rich ore to the west in Con. Virginia on the 800-foot level. Tbis probably accounts for the activity in Andes. In Savage, connection on the 1300-foot level bas been made witb Hale and Norcross. This gives good ventilation and admits of more active prospecting work on tbat and lower levels, besides which the company can hoist tbeir own ore from the lower levels. The battery assays ought to be higher. In Hale and Norcross, active work is going on—report says that they are filling up the drifts leading to the rich ore. In Ophir, active and important work will soon be inaugurated. Good results ought to he forthcoming at an early day from the work going on in Best and Belcher. The north drift running from Potosi winze toward Chollar should begin to attract attention, for it is quite certain tbat good ore will be struck. The official letter from Crown Point, received yesterday, holds out bopes for an improvement in the mine as work goes west. In Belcher the one-foot streak of rich ore has widened to very nearly two feet. Other work in the mine is of an important character, as is that in Seg. Belcher. In the Alta group the work is becoming more interesting. Another new and rich streak was run into this week in Lady Washington drift running toward Benton. Old miners are hopeful of good results in these mines at an early day.

Advices from the Tuscarora mines are very encouraging. It is claimed tbat dividends will be in order, provided the new milling company does not make milling a losing game for the mines. From the Bodies our advices report that the Standard has plenty of paying ore to run the mill for a long time. In Mono there is one miner at work. As the work progresses toward the 800-foot level in Bodie, experienced miners speak more encouragingly.

Assessment Notices.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, tbat at a meeting of the Board of Directors, held on the 25th day of August, 1890, an assessment, No. 19, of six (6) cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which tbis assessment shall remain unpaid on the 29th day of September, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of October, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office, Room 11, No. 303 California Street, San Francisco, California.

THE TWENTY-FIFTH
INDUSTRIAL EXPOSITION
— OF THE —
MECHANICS' INSTITUTE, 1890,
Opens Sept. 18th, Closes Oct. 25th,

With a grand display of Inventions, Manufactures and Art. The Latest Novelties and Improvements in Electricity will be made a special feature, including the celebrated Edison "Tower of Light." The Music will consist of a band of 42 talented musicians, supplemented by the best Vocal Talent obtainable. Miss Mathilde Lennon, a noted Contralto Singer from London, and late from Boston, has been engaged, as also Miss Pearl Noble, the accomplished young Californian Cornetist. The Art Gallery, 200 feet long and 50 feet wide, will be filled with rare and beautiful works by local and foreign artists, in oil and water colors. Photography will be shown in the most attractive form by Professionals and Amateurs. Machinery of all kinds will be in operation, and many novelties exhibited for the first time.

Admission:

Double Season Tickets, $5.00 | Single Adult Admission, 50c
Single Season Tickets, 3 00 | Children, 25c
Season Tickets to Members of the Institute, Half-Rates.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. Willis E. Everette, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

DEEP WELL PUMPS

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

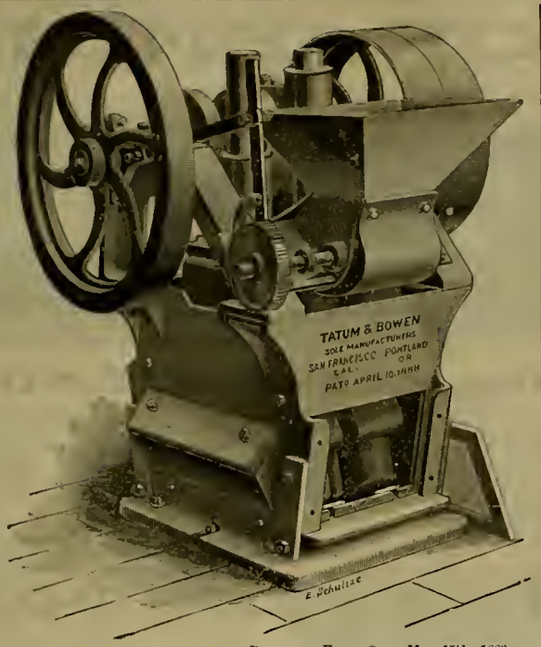
—THE—

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective

Automatic Ore Feeder.



RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

The Mills as we make them now are Far Superior to the one at the New York Mine.

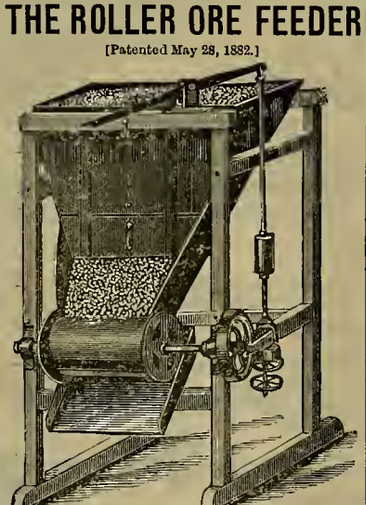
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battern as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

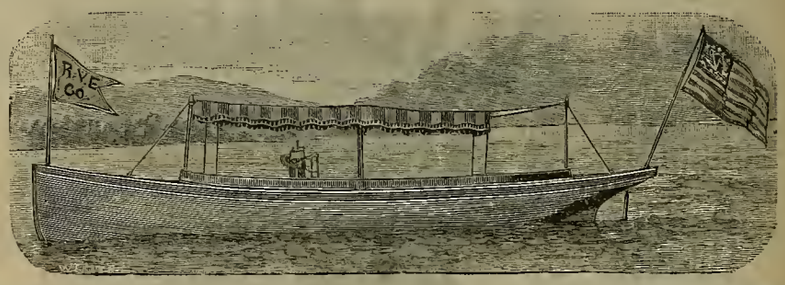
GEORGE HAAS, 824 Market St., Phelan Building, } SAN FRANCISCO, Feb. 21, 1890.

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do s my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per m nth so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am sa isfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.
Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

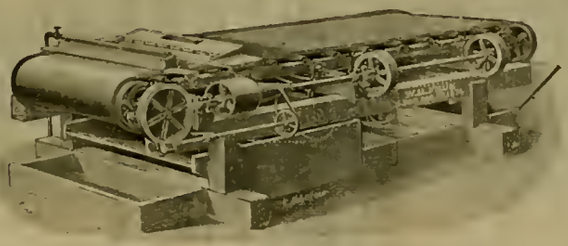
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having do hle the Capacity and doing its work as olose as the plain Belt machine, while Its concentrations aro clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improvod Belt Frues are taking the Pulp from 120 Stamps, orushing 350 tons per day, and is giving ontire satisfaotion as against 48 plain Belt Machines, taking tho Pulp from the other 120 Stamps.

Price ol Improved Belt Frue Vanner, $825, f. o. b.
Price ol Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlots, Testimonials and furthor information apply at ollico.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

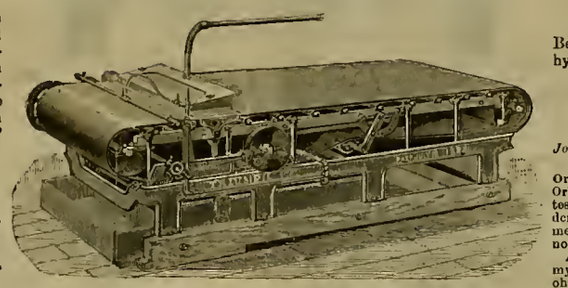
"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

Tho oompetitive trials which have heon held between the "Trimph" Ore Concentrators, the "Frue" Vanners and othor forms of oonoentrating devices, do not warrant the assertion that tho "Frue" Vanner is the best ore ooncentrator in tho market. The faot that the "Froes" have improved (corrngated) belts does not militate against the superiority of tho "Trimphs;" for, when desired, they (the "Trimphs") can he mounted with a superior helt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.

Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Trimph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestahle letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

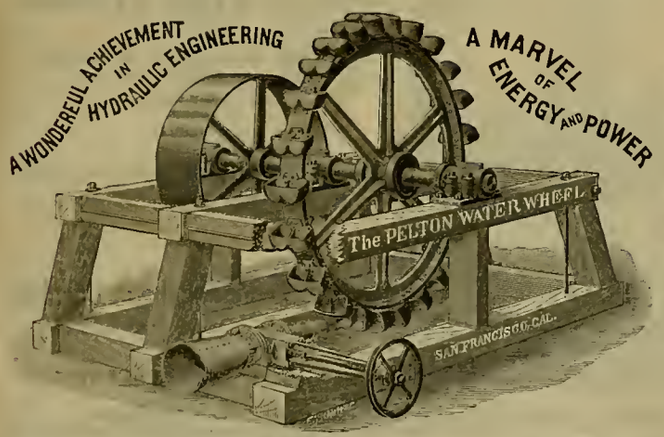
GENTLEMEN—I am pleased to state, in reference to the "Trimph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am coovinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.



A WONDERFUL ACHIEVEMENT IN HYDRAULIC ENGINEERING
A MARVEL OF ENERGY AND POWER
The PELTON WATER WHEEL
SAN FRANCISCO, CAL.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

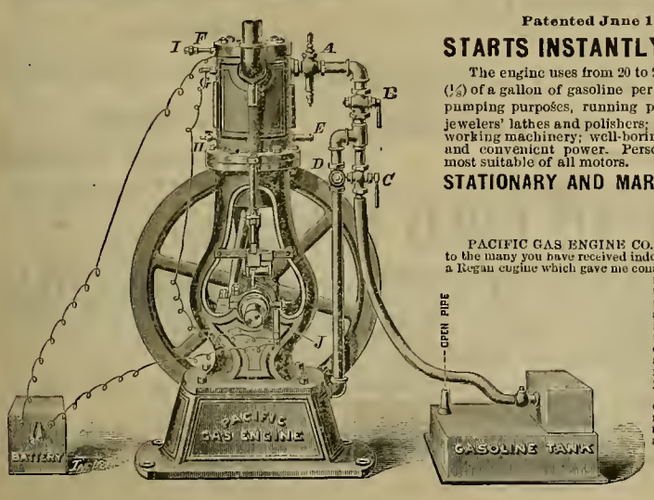
PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

THE PACIFIC GAS OR GASOLINE ENGINE.

Patented June 17, 1890—Nos. 430,504, 430,505, 430,506. Also in Great Britain and other foreign countries.

STARTS INSTANTLY WITHOUT THE NECESSITY OF BOILER, FIRE OR EXPERIENCED ENGINEER.



The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth (⅛) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED, and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY AND MARINE ENGINES FROM 3-4 TO 15-HORSE POWER. OVER 100 IN ACTUAL OPERATION.

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890.

PACIFIC GAS ENGINE CO.—GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, mine was a Regan engine which gave me considerable trouble. I had to remove the head and raise the tappet valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliances, head, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head from any cause since you made the change (over two months). It gives me no trouble; my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective and cheap

Respectfully yours, B. S. HILL.

Cor. Encinal Ave. and Morton St.

U. S. MARINE HOSPITAL SERVICE, DISTRICT OF THE PACIFIC.
SURGEON'S OFFICE, PORT OF SAN FRANCISCO, Feb. 1st, 1890.

TO THE PACIFIC GAS ENGINE CO.—GENTLEMEN: In answer to your letter of inquiry, of the 23d ultimo, relative to the working of the two-horse power vapor gas engine, recently set up by you at the U. S. Marine Hospital, Mounta n Lake, near the City of San Francisco, Cal., I have to say that, up to date, the engine has given entire satisfaction, developing the power required in the specifications: of "raising 20,000 to 30,000 gallons of water 100 feet high through 600 feet of two-inch iron pipe, to tanks on the hill, in 24 hours." It is more economical than steam, requires less attention, and can be set in operation at a moment's notice.

If it continues to do its work as satisfactory as it has done since December 22d, 1889, when placed in operation, it may be pronounced a perfect success.

Very respectfully, PRESTON H. BAILHACHE,
Surgeon U. S. Marine Hospital Service, Custodian.

HOFMANN'S ANNULAR KILN FOR CEMENTS.

The Late Governor Stevenson.

Charles C. Stevenson, Governor of Nevada, died at Carson City, on Sunday morning, of typhoid fever. Besides his political prominence, he was widely known on this coast as a mining man. He was brought up in Ontario county, N. Y., as a farmer, and moved to Nevada, from Michigan, in 1859, crossing the plains with a train that started for Pike's Peak, but changed their original plan when they found that the hubble had burst. They changed their plan again when they found that mines had been discovered at Gold Hill, and instead of coming over to California, went up the mountain and took to mining on the Michigan claim, now one of the Imperial group.

Mr. Stevenson was elected State Senator in 1865 and again in 1877, and in 1874 he was elected president pro tem. In the Senate he showed sterling qualities. He did more to revive mining in Gold Hill and set the stamps at work than any other man. He kept at work on the Kentuck for years during the dull times and was taking out low-grade ore and working it when no other mine on the lead was paying a dividend or ever expected to. When he proved the practicability of working the low-grade ore of the Kentuck ground, it set the owners of Belcher and Crown Point to work also. Previous to that he had worked ore from the old Empire for many years, and gave steady employment to a great number of men. In 1861 he purchased a half-interest in the first quartz-mill erected in Nevada, known as the Coover & Stevenson mill, and has ever since been engaged in mining and milling. He was a man of affairs, energetic and enterprising, and was always an employer of men, instead of himself being employed by others.

Cement Kilns.

The State of California possesses within its boundaries all the ingredients necessary to produce both natural and artificial cement, and yet we continue to neglect the advantages that would accrue to the State from home production, and import thousands of dollars worth of cement annually. What is required is a stone in which the lime and clays are in such proportions that when burned they will chemically react on each other, forming silicates and aluminates of lime. Such a natural combination is seldom found, but those approaching it are of common occurrence, and particularly in this State. Such material can be burned to the verge of vitrification, and the resulting powder is dense and attains increased tensile strength by such burning.

In making hydraulic cements, the kilns principally used in England are "Dome kilns," which are similar in construction, though slightly differing in shape to the "American Natural-Cement kiln." The mode of burning in this kiln is simple. Wood is placed on the grate-bars two feet high, then a layer of coal, on which alternate layers of coke or hard coal and dried lumps are arranged. The proportion of coke to material decreases from bottom upward. About ten per cent of the weight of the raw material of coke or anthracite coal is requisite to burn such a kiln.

A ring kiln is a circular or oval flue (burning chamber) surrounding a smoke chamber, within which circle is a central stack. The burning flue is so arranged that at certain distances it can be separated into sections by dampers which are let in from the top. These sections are connected by smoke flues (having valvular dampers) with the smoke chamber. Each of the burning sections has a doorway through the outer wall five feet high by four feet wide, through which the kiln is loaded and unloaded. The tops of burning sections are pierced with holes for admission of fuel. These holes are three to four feet apart, in three rows, there being from 15 to 21 in each section.

To explain the method of burning in this kiln: Assume the sections of the burning chamber to be numbered 1 to 14. The dampers between Sections 1 to 14 closed (down), and the valvular damper of 14 connecting it with the smoke chamber opened (all the other valves in the smoke flue being closed).

(*Concluded on page 210*)

THE LATE GOVERNOR STEVENSON OF NEVADA.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Silver and Values.

EDITORS PRESS:—Now that silver is rapidly regaining the position in financial affairs which it lost through its demonetization and consequent degradation, it will not be out of place to approximate the loss caused to a part of the producers of the United States during the period of its depression in price.

The British merchant all through this time of depression in silver has sold his gold for silver, and taking the silver, has purchased with it wheat and cotton in India, which he has taken to the British and European markets and sold for gold; thus making a double profit on the transaction—one on the silver and one on the merchandise.

We find on investigation that the average price of wheat, cotton and silver for the ten years from 1869 to 1879 was as follows:

	Wheat, per bu. $1.046	Cotton, per lb. $0.15 17 100	Silver, per oz. $1 2632
Ten years, 1879-1889....	.870	0.10 86-100	1.07
Decline....	.17 6 10	.07 21-100	.1932

As the prices of these commodities are governed by the price for the surplus marketed in competition with goods purchased in a country where silver is freely received at par with gold for similar commodities, it can be readily seen that the shrinkage affects the whole production. With this before us, we can figure what the wheat, cotton and silver producers of the United States have lost in the last decade.

The gross yield of wheat for this period of time, as given by the Treasury Department, was 4 445,150,218 bushels, which, multiplied by 17 6 10 cts. per bushel, amounts to $784,106,418.37.

The gross output of cotton was 28,893 980,064 lbs.; at 7 21 100 cts. per lb. amounts to $2,083,255 962 61.

The output of silver, as per Mint reports, was 371 250,000 oz.; at 19 32-100 cents per oz. is $71,725,530, making a total of $2,939,087,880 98 lost in ten years' time to the producers of these three articles alone. It is true that this immense sum did not all go as profit to our British cousins, but the shrinkage in price made this difference to the people of the United States and was a shrinkage in exchange or barter value that seriously affected them, as is evidenced by the existence of our three billions of mortgages on the farms of the West and Northwest. The statistics on cotton showed that over 67 per cent of the product was exported; on wheat the per cent exported is not given.

It seems, in the face of these figures, that the amount of silver, or its price as to itself, is insignificant when compared with the leverage it gives other commercial nations to reduce the prices of the immense volume of agricultural productions of this country.

The producers of the articles mentioned have been competing against a double profit. The merchant of Great Britain made sufficient profit on silver to enable him to sell wheat and cotton at cost, and as it was to his interest to cheapen silver, he constantly did so by belittling it. It would look as if the Government of the United States could afford to absorb every dollar of silver in existence and issue certificates for it. It certainly would be a profitable transaction for the American producers, for it would take away from their competitors the weapon used to slaughter them. The figures herein given only touch the subject.

Cheap wheat and cheap cotton cheapen numerous other lines. A computation of the losses on them would stagger an ordinary mind.

What I have given here is sufficient to explain why British capitalists have a surplus of funds to invest in the industries of America and to sink in Brazil and elsewhere. We have presented them, through a stupid financial policy, with millions, and now they return it to be invested so that we may work for them and pay them interest on our own money. It is to be hoped that our financiers may continue in their new departure, and when silver gets to par that it will meet a law already enacted giving the silver producer the right of free coinage and the option of standard dollars or certificates redeemable in that very respectable and hard to be got "dollar of our daddies."

J. H TINGMAN.

San Francisco Sept. 18th

Calico Mining District.

EDITORS PRESS:—The Bismarck mine (T. Finnegan) has taken out ten tons of very good ore within the past few weeks.

Preston & O'Day have the Backfoot mine leased for one year. Considerable ore is being developed on this property, which has been a good producer for the past seven years.

On the Silver Quartz mine, John McCall, S. Thomas and John Goodwin are chloriding.

C. Wallace is screening the old dumps of the Cuba mine.

At the Champion mine 150 tons of ore are on the dump, ready for shipment. MINER.

Calico, San Bernardino Co.

Open Letter on Timber-Cutting, Etc.

EDITORS PRESS:—The letter below is of public interest and is fairly typical of many similar inquiries received by this board. We publish it as explanatory of our rejoinder.—WM. S. LYON, for the Board.

SHASTA CO., CAL., Sept. 20, 1890.

To State Board of Forestry—GENTLEMEN: I have read that it is against the law to cut any timber on Government land. Now I would like to have some shakes and have got no timber for the purpose nor money. Can I go up the mountain and cut a sugar pine down and split it up into shakes for my own use? If you please, kindly answer this question for me. Inclosed you will find a two-cent stamp." Respectfully yours, A SETTLER.

Reply.

A SETTLER, ESQ.: Yes, dear sir, your interpretation or reading of the law is entirely correct, and the cutting of that sugar pine upon which you have cast covetous eyes will surely consign you to limbo and the reproaches of all God-fearing citizens. You should know that the deadly machinery of the law is oiled and full-cocked for just such premeditators of evil as yourself. Further, to side-track temporarily the moral featnres of the case, you must not overlook the fact that the tree in question, according to the price the Government sells its timber lands for, represents a national asset of from 15 to 50 cents, this value varying in accordance with its size and remoteness from or accessibility to a market; and that it will only cost the nation from $500 to $1000 to follow, drag you up to the bar of justice and vindicate upon your person or pocket, or both, the majesty of the offended law. The more remote and less valuable the tree, the more certainty there is of your speedy attainder.

Remoteness hath a charm for the Deputy U. S. Marshal; it stimulates the sleuth-like proclivities; it means increased per diems, increased mileage and increased traveling expenses. It gratifies his love for solitary communion with Nature as he finds her in a mountain resort and enables him to shake dice all day under the heading of "incidentals," while gleaning from your dearest enemy the damning chain of evidence that stamps you as a malefactor and felon.

Again there are the very shakes themselves to confront you with; they "split" on you so to speak, and if these he made from a good cut, leave you no knot-hole of escape from the myrmidon who seeks only evidence that convicts, for thereby hangs all of his glory and much of his plunder.

If in the face of this warning you still incline to shelter your head from Shasta's summer solstice or winter's snowy storms, we suggest that you go a step further and add the trifle of arson to your contemplated misdeeds and cover up your tracks with fire.

If a likely, active fellow, and you select the dry season and a windy day, you can start a fire that will quickly wipe out the evidence against you and perhaps a quarter million dollars of public property; the shakes will haunt you, follow you up like an avenging and remorseless Nemesis—the fire, never. They must catch you *in flagrante delictu*, which means that the Government agents must be afield and alert at all times, which would cruelly handicap their social diversions in the mountain saloons, and if you are any way discreet the chances of obtaining direct evidence against you are so slim that you need hardly fear close investigation; the result of impeaching you could only be in the interest of the public good—not the financial gain of the zealous conservator of the public timber who only moves on "dead things."

If you rive out more shakes than you require, by all means try to sell some to your neighbor; incidentally this will clinch the evidence against you but furnish the wherewithal to secure such cold comfort and relief as an occasional stamp invested in the direction of the General Land Office (the proper authorities) may afford.

A correspondent whose moral perceptions are so blunted that he is capable of confessing to both poverty and the attributes of good breeding indicated by the inclosed stamp, is such an anomaly in this generation that we are prompted to look upon your request with some suspicion, and if you would earn aught but the contempt of the public, you must at any rate promptly redeem yourself from the stigma of impecuniousness; buy a flock of sheep and steal pasture for them from the public domain.

If industrious, your flocks can trample out and destroy the forest prospects of Shasta county for generations to come; and if the work of annihilation proceeds not quickly enough, a touch of the torch will accelerate matters and assure you of a grass crop the next season.

Meantime your prestige and standing in the community as a wholesale plundering robber of the public timber lands will entitle you to a consideration at the hands of the General Government that they will never accord to the petit larcenist of a few shakes.

The efforts of this Board to whom your appeal is made have been for some years directed to convincing the Congressmen from your State and district, and who are directly responsible for the present condition of affairs, that a little surveillance of you after you have bloomed out a fire-fiend, pasture brigand and all-around outlaw is a more important matter than a too close scrutiny into how you came by your woodpile or bunch of shakes. So far, they have seen fit to differ from us, and continue to strain at gnats and swallow camels, and the chances are that if you cut that sugar pine, they will strain you so fine through the meshes of the U. S. District Court for the Northern District of California that you will be indistinguishable from a Shasta county gnat. Our advice is that you don't.

STATE BOARD OF FORESTRY,
By W. S. LYON, Forester.

Los Angeles, Cal.

The De Lamar Mine, Idaho.

From the letter of a Boise City, Idaho, correspondent of the Salt Lake *Tribune* we take the following:

Wagontown is down the gulch several miles below Silver City. Its chief property the past few years was the Wilson mine, worked to a small extent. Captain J. R. De Lamar went there four years ago and purchased the Wilson mine, which was then nothing but a mere prospect. He has since then displayed remarkable energy and pluck and succeeded in developing one of the best mines in Idaho, if not of the entire West. He ran a tunnel 1200 feet long to crossent the veins and reach a depth of 400 feet. This tunnel drifts on one of the veins 350 feet in ore. Four levels have been cut, and now he is running another tunnel 200 feet lower than the main one. The tunnel cuts first a vein 15 feet wide, second 19 feet, third 26 feet and fourth 77 feet, while there are several veins from five to six feet each between these. Ore taken from these large veins and milled averages about 13 ounces silver and $20 in gold, and there is enough in sight to keep a hundred stamps running for years. Then there are large deposits of rich silver which is shipped direct to smelters with remarkable returns.

It is not an easy task to convey to the reader an idea of the great value of this property. The formation is in andisitic porphyry, with hanging-wall of iron and clay. And here is one of the remarkable features of the mine: This clay is full of pyrites of iron, and so rich in silver that to place a lump of it in a fire drives out many nodules of silver. In places this clay contact, in a thickness of five feet, yields silver at the rate of $1000 per ton.

There are places in this clay with black nodules of silver looking like small shot imbedded in almost pure clay, while nuggets of silver in value from 25 cents up into dollars are picked out. While this clay predominates in silver, there are streaks of talc which run from $200 to $300 in gold. Mr. De Lamar thinks of converting this clay into brick by burning in a kiln, and then run through the mill to extract the silver. While the main body of the veins produces good milling ore, there are deposits of very rich rock. In operating the 20-stamp mill the past few months, it has produced an average of $50,000 per month in bullion, while there has been shipped ore to the value of $25,000 per month. This rich ore has been taken out of stopes. One of these stopes, 100 feet long, 20 feet wide, and an average of two feet thick, has turned out $350 000 in sacking ore. Think of sending out a carload of ore every few days which nets the lowest about $4000, while the highest runs up to over $18 000 per carload, and this at a small cost of extracting, shipping and working charges. The group covers a space one-half mile wide and one mile long, or did three days ago, but since then a large lot of claims, aggregating about 120 acres, known as the Sommercamp group, has been added by purchase at a cost of $50,000. This gives Mr. De Lamar in all about 450 acres, embracing almost the entire hill, and so situated that his workings can extend entirely through it, with waste dump one side and milling facilities the other. He very wisely secured a large number of mill-sites on the creek, and thus controls its waters by owning a strip of land 300 feet wide and one mile long. On one of these sites is the 20-stamp mill. It is a model in construction and operation. It is 700 feet below the mouth of the working tunnel from which ore is sent down by a tramway 2350 feet long. The actual cost of mining ore is about $1 per ton, and for milling, $3 50 or $4.50 per ton from the mine to the bars of bullion.

At present the property is producing $75,000 per month at a cost of less than $30,000, including all costs of operating and developing. The owner intends to add next spring 100 more stamps and run up the output to $300,000 per month.

A LIBRARY FOR EMPLOYES.—At the general offices of Wells, Fargo & Co.'s Express a room is being fitted up for a library. The library is a recent institution, but has proved a great success. The use of the library is confined to employes of the Express Company. The fee for membership is 25 cents a month. The library is open in the morning before working hours, at noon for an hour and after working hours at night. It contains the leading publications of Europe and America.

THE 12-stamp mill at the Caips mine will soon be completed, says the Sierra *Tribune*, and will be run by water-power from the Yuba river. No. 2 tunnel is in a distance of 350 feet and the ledge crosscutted on the 250 level north and south. No. 3 tunnel, 450 feet lower down the mountain, has been run 400 feet. About 450 feet farther and the vein will be reached.

Railroads Must Not Discriminate.

A result of much importance to shippers by rail has been attained in the Superior Court of Santa Cruz county by which the South Pacific Coast Railway Company has been inflicted with a verdict to pay $8000 because of discrimination and refusal to furnish cars to S. H. Chase & Co. for shipment of lumber from their mill near Boulder creek. It appeared in the evidence that Mr. Fillmore, then manager of the road, had given orders to refuse Chase & Co. cars, and as a reason stated that Chase & Co. were underselling the San Jose Lumber Association, and that by so reducing the price, freight rates would eventually have to be reduced, and therefore he refused to let Chase & Co. have cars. Mr. Fillmore also said that Mr. Chase refused to join the San Jose lumber combination, and told him that if he would join it he would be furnished all the cars he wanted. This Mr. Chase and his partner refused to do.

The case occupied the attention of the Superior Court for over a week, and during the course of the trial Chase & Co. abandoned some of their minor claims for damages, such as for expenses of keeping oxen when the refusal of cars stopped their work, the loss on sub contracts to furnish lumber, etc., and confined their claims to actual damages caused by the loss of business and for punitive damages.

Judge McCann delivered a lengthy charge. The jury retired, and in two hours returned with a verdict for $8000 in favor of the plaintiff. The jury stood nine to three. Chase & Co. claimed $9706 actual damages and over $40,000 as punitive damages.

Though the verdict hardly covered the actual loss to Chase & Co., and though the company will probably fight the issue further, it is some satisfaction at least to have a verdict declaring that discrimination and the attempt of a transportation company to rule production and commerce instead of serve them are illegal. The country has suffered considerably by such discrimination and almost conspiracy between favored shippers and the railways against the business of other producers and shippers. The issue should be pushed in the public interest until common carriers are taught that they must treat all shippers fairly and impartially.

Mount Conness.

Prof. George Davidson and party have just returned from a scientific expedition to Mount Conness, where they had been [illegible] for a month in giving a maximum trigonometrical strength to the west end of the great arc of the parallel stretching from the Pacific to the Atlantic, on the 39th degree of latitude.

The work was one of great difficulty, for the trails leading to the summit had not been used for three years and had been nearly obliterated in places by the severity of the winter storms. Two whole months were occupied in clearing the way, and even then considerable difficulty was experienced in transporting the apparatus to its destination.

Though called a mountain, Mount Conness is nothing more than an immense shaft of granite rising perpendicularly 1300 feet from the tablelands. The sides of this gigantic pillar are weather-worn, split, cracked and fractured in every conceivable manner. Great masses are ready to topple by the addition of another pound on the outer edge; slabs of 100 feet in hight seem ready to fall off by the leverage of a crowbar, and on the crest-line trail to the summit the advance were afraid to use a blast, so torn and broken and toppling did it seem. Nevertheless a trail was cut and a house for the instruments was erected on the very pinnacle, where there was but eight feet of standing-room. A considerable part of the trail is but 18 inches wide over a perpendicular abyss of from 800 to 1200 feet, along which the heliotrope and other cumbersome instruments were carried without injury.

After the road was opened many visitors made the journey to the summit, among them being two ladies, one of whom hails from this city.

The River Mills.

The Carson *Appeal* gives the work now being done by river mills. It says:

The following figures will show what is being done, and the present condition of things indicates that it will continue to be done for some time to come:

Eureka mill—Con. Cal. and Va. ore; 260 tons per day.

Douglass—Tailings; 200 tons per day.

Brunswick — Yellow Jacket and Overman ore; 200 tons per day.

Mexican—Savage and Crown Point ore; 125 tons per day.

Morgan—Tailings; 100 tons per day.

Rock Point—Savage ore; 60 tons per day.

Vivian—Belcher ore; 40 tons per day.

These figures are likely to increase in a few days, and will in all probability double if silver continues to rise as rapidly as it has of late.

Each mill has on a heavy force of men, and laborers who have heretofore been idle are now holding lucrative positions.

LEASING continues to be on the increase throughout the camp of Butte, and at the present rate there will soon be but few of the old mines idle.

[Copyright, 1890, by Dewey & Co.]

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XII.

[Written for the Press by James H. Crossman.]

Ord Mining District.

This district, on Ord mountain, comprises within its boundary lines an area of 342 square miles of mineral territory, the larger portion of which is unprospected. The district, as well as the mountain in which it is situated, derives its name from General Ord, U. S. A., who in 1866 commanded a military post (during a period of Indian hostility) at Camp Cady, a station on the Mojave river. The tribe of Indians that roamed over and inhabited this desert region were the Pintes, who were at that time numerous and on the warpath.

A detachment of scouts detailed by General Ord to investigate the mountain where Indian signal fires were frequently seen, on their return reported the mountain to be an Indian stronghold, also that it contained numerous springs of running water, and that while traversing the northerly end of the range they noticed a long line of croppings of a strong vein whose comb could be traced for several miles. On examination the rock showed particles of gold and also copper stain. A subsequent examination of the locality determined its location to be on the westerly extremity of the mountain range in Tp. 7 N., R. 1 E., at an elevation of 4500 feet above the level of the sea, and at a distance of 7½ miles in an air-line southerly from Daggett on the Mojave river, now a station on the Atlantic & Pacific railroad. This mineral discovery of the scouts soon became known. Miners and prospectors flocked in. The Indians left for some other locality. A mineral district was soon after formed which was given the name of the commander of the post (Ord). Locations were made, but the mines, though abundantly rich in copper and gold, were too far from a base of supplies to prove remunerative.

The locators being men of limited means, their capital soon became exhausted, and but little was accomplished toward actual development. At a later date J. B. Osborne, the well-known mining operator of the desert regions, formed an association with H. L. Drew, a capitalist of San Bernardino, as a partner, and commenced purchasing the locations. They succeeded in absorbing all of the most prominent mines of the district, and patented a number of them.

They commenced a systematic work of development and at date have expended a figure in excess of $70,000 in opening the mines, building roads, etc. A graded road to Daggett measures on the contour line 14 miles, over which the ores of the mine can be transported for a figure less than $1.50 per ton.

The purchases and locations of Messrs. Drew & Osborne are as follows: The Brilliant, Tehachipi, Modesto, Josephine, Last Chance, Coupon, Central, Rio Vista, Painsville, Empress, Cliff, Bluff, Sweetwater, Posy, Sonflower, Aztec, Coldwater, Bluebell, Keystone, Climax, Point Conception, Atlantic, Souset and Wide West. They have numerous springs of water and territory suitable for townsites and reduction works—in fact these gentlemen are virtually possessors of a principality of mineral wealth. Of the 24 enumerated mining locations, nine have been patented and all have more or (yellow and peacock), metallic copper in scales and powder—all carrying more or less gold in combination. The average yield of the metallic copper which is found at a depth of 250 feet in the Rio Vista mine is significant, when we take into consideration that the stamp work of the celebrated Calumet & Hecla mine of Lake Superior yields only from 4 to 5 per cent of this metallic product.

Of the group, the Coupon is the most important copper mine, showing a width of vein stuff between its incasing walls of 100 feet, with concentrated ore in bands and streaks of varying widths from 8 to 30 feet, with stringers and spurs occurring forming feeders which fall into the vein at its greatest point of expansion. Average samples taken from several openings on the mine of varying widths from 8 to 20 feet, gave the following returns, as assayed by Thomas Price & Son, San Francisco:

	Silver and gold values.	Copper.
1—Coupon	$5 97	11.1-10
2— "	4 83	9.2-10
3— "	—	10 51
4—Rio Vista	7 34 metallic copper	11.85

The gangue of the Conpon mine is of a character that admits of concentration to a high percentage before going to the smelter. These ores carry their own flux, iron and silica, with an abundance of lime, in the form of spar, which forms the west wall of the Conpon vein. It reaches its greatest expansion at a point where the Tehachipi intersects the main ore channel. (See plan.)

Development.

All of the principal mines have been sufficiently developed by shafts, crosscuts, levels, fissure. The ores of this mammoth vein contain copious development, exposing immense quantities of copper and gold bearing ores.

Gold.

The principal and most developed are the Atlantic, Sunset, Point Conception, Rio Vista and Painsville mines, which carry an average grade of ore sufficiently high in the precious metal to warrant their transportation, if necessary, to the Mojave river for reduction.

Samples were taken as average from the above-named mines and assayed at Messrs. Thos. Price & Son's assay office in San Francisco, with the following results:

Name of mine.	Silver.	Gold.	Total.
Sunset	$1 70	$22 74	$24 44
Rio Vista	10	14 47	14 57
Point Conception	5 50	10 34	15 84
Painsville	20	22 74	22 94

Copper returns not given, though the ores contained an appreciable quantity of that metal.

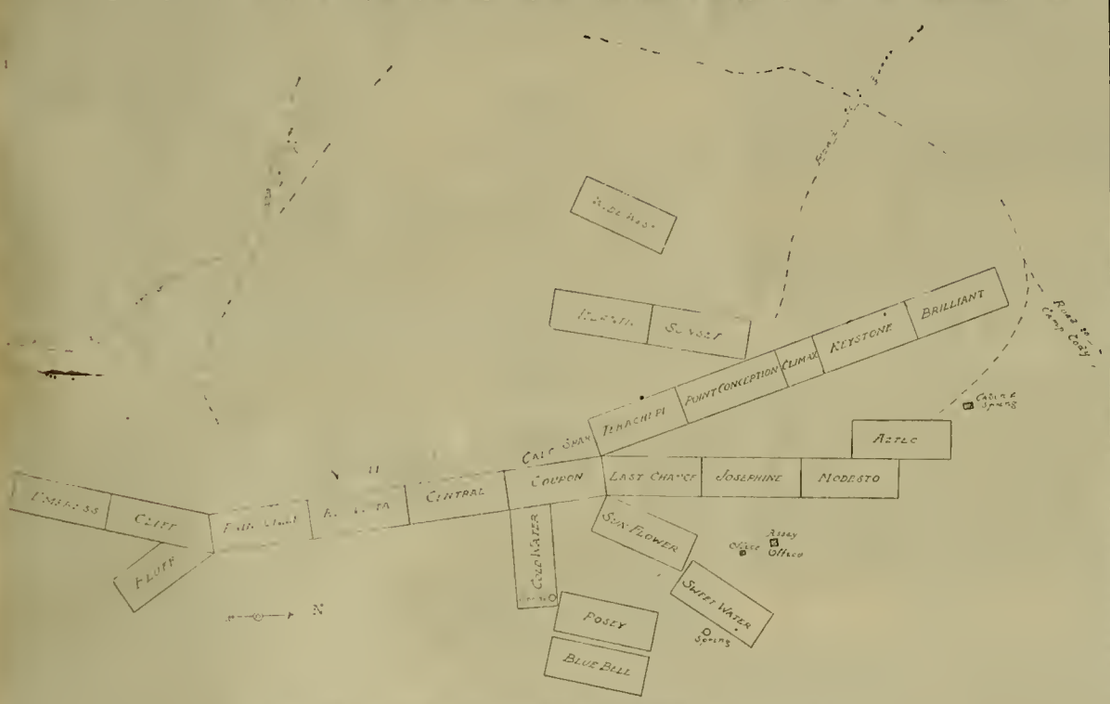
Copper.

While the enumerated mining locations all carry the ores of copper and gold, the mines in the main arterial lode comprising the Modesto, Josephine, Last Chance, Conpon and Central, with their lateral branches and spurs, have greater values for their copper product than for the precious metal. They are essentially copper mines, though as a rule of medium grade. Their lineal extent, great width and immense reserves warrant the erection of an extensive reduction, concentration and smelting plant. These ores consist of oxides (black, red and gray), carbonates (blue and green), sulphides per, gold and silver. The chimneys of ore are the black, ponderous metallic product in chunks, and angular fragments strewn over the surface. We reach a vein of massive mineral that measures from wall to wall 30 feet. This location is known as Dick Turpin No. 1. We follow its course on a descending grade in a westerly direction, and the vein expands and increases in size until at the boundary line between Turpin Nos. 1 and 2 it has reached a width of 80 feet, gradually expanding until at the northerly extremity of No. 2 claim it attains a width of 400 feet. Two locations have also been made on a twin vein known as Tip Top No. 1 and No. 2. The ores are of a similar character, highly magnetic and remarkably free from sulphur or phosphorus; here the needle is inoperative—the polar star has no longer any attraction. In places on the Tip Top the ore changes to a soft gray iron ore known as "nut ore."

The iron vein outs the mountain slope diagonally, disappears, and is covered by the debris of the desert plains. Another location in the vicinity is known as the Bessemer, showing a strong body of ore.

Four miles southeasterly from this point and on the same line of strike an extensive body of a similar character of ore occurs; it is from 20 to 100 feet in width. All that is required to make this immense body of iron available is railroad transportation, fuel and water. It lies on the borders of Rabbit Spring valley with a smooth and level road to Victor, a station on the line of the California Southern R. R., 36 miles distant in an air-line and about 42 in its contour. The gold and copper of the Ord group and the iron of Iron mountain will at no distant day warrant the construction of a railroad to these important properties.

(To be Continued.)



THE MINES OF ORD DISTRICT, SAN BERNARDINO COUNTY, CAL.

drifts and quarries to denote their character as true fissure veins of unusual width, persistence in depth and longitudinal extent. The values of the ores have been repeatedly proved and tested by chemical analysis and working tests.

The main arterial lode coursing longitudinally with that portion of the range in which it occurs, has been bisected and eroded by a ravine to a depth of 800 feet below the outcrop of the southerly location. This affords facilities for extending an adit southerly from the northerly exposure of the vein in the Point Conception mine on and in the vein to the full extent of the claim in that direction, passing longitudinally through the rich chutes of ore found in the Point Conception, Tehachipi, Coupon, Rio Vista, and at a distance of 8500 feet from its mouth give a vertical hight of 700 feet in the center of the Painsville mine, allowing four inches of grade to the rod.

Another important site for an adit would be at a point on the east slope of the divide opposite the Josephine mine, where a crosscut through the country would intersect the vein at a distance of 150 feet; thence southerly on the line of the main ore channel. In either of these adits the ores could be moved by gravity from mine to reduction works, the adit serving as a conduit for the passage of the water of the mine to the work.

Geological Features.

Ord mountain, at its greatest elevation, reaches a hight of 6300 feet. Its strike is northwest and southeast, its axis granitic, its make-up a heterogeneous mass of a great variety of rock, with but little apparent order or system. On its northeasterly flank an extinct crater of considerable dimensions occurs that at no remote period poured forth immense quantities of molten lava, covering the face of the country for many miles in a northerly direction. Its northwesterly borders have been traversed longitudinally and transversely by a mammoth of considerable longitudinal extent and of great width. The strike of the lode is N. 5 W. and S. 5 E. The greatest expansion takes place where the Tehachipi mine intersects the Coupon at an acute angle. The vein is traceable by croppings and float for the entire distance from the Empress on the south to the northerly boundaries of the Point Conception and the Josephine mines, where it dips and is covered by the alluvions of a deep ravine or wash, to reappear again on the opposite bank in the Modesto and Brilliant locations. The lineal extent of the main arterial lode is 19,600 feet; northwest branch, 6000 feet; parallel lode, 3000 feet; adjacent and auxiliary location, 10,500 feet, or 39,200 feet in all.

The numerous springs that break out from the mountain-side indicate an abundant supply of water for all practical purposes.

Iron

That the mineral wealth of Ord mountain is not confined exclusively to the cupriferous, auriferous and argentiferous veins is demonstrated by the recent discovery of immense veins carrying the most valuable of all of the ores of iron (magnetites and hematites).

At a point on the westerly slope of the Ord mountain range, known as Iron mountain, 14 miles in a southeasterly direction from the Ord group of copper and gold-bearing mines previously described, and 18 miles southeasterly from Newberry station on the Atlantic & Pacific railroad over a road of easy grade, this important development occurs.

Eight miles distant from the mines in question the rocks show every evidence of the powerful effects of volcanic disturbance. Crossing the divide eight miles westerly from its summit, all evidence of subterranean heat and metamorphic action has disappeared, the axis of the range is granitic and the granite is in place and unchanged; at an elevation of 3350 feet (aneroid readings) we note the first evidence of

Eureka District, Nevada.

The Eureka *Sentinel* says: From the year 1864 up to the present time about 4500 mining locations were recorded in Eureka county, nearly 4000 of that number having been recorded in Eureka district. A large number of the latter were located during the most prosperous period of the camp, for speculative purposes only, that were never touched with a pick or shovel, but were abandoned. A large number of abandoned claims were several times relocated, and many bona fida claims were partly developed and consolidated or merged into companies. At no time were there ever more than 400 producing claims in the county, and at the close of last year less than 70 mines were producing ore. There are several reasons for this decline, principal among which were the low price of silver that was caused by its demonetization in 1873, high prices of fuel for the reduction of ore, high rates of transportation, discrimination of the Southern Pacific R. R. Company against us, and exorbitant charges and discounts made at our local reduction works which were the outcome of the other causes. There are a large number of claims in this district that formerly produced ore in abundance which have lain idle for years past. They did not pay to work under the circumstances above related; but all of the detersive causes have been removed, and there remains no good reason why they should not now be reopened and become productive and profitable to their owners as well as beneficial to the camp.

THE LOW ADJUSTABLE CAR.—Some time ago an account was published in the MINING AND SCIENTIFIC PRESS of the trial trip of the first one of these cars built, and the car was then pronounced a success. That car has been in regular service ever since on the Omnibus cable road in this city, giving great satisfaction, and the almost instantaneous transformation of this car from a beautiful open summer car to a perfectly closed or winter car may be seen daily when in use on the road. Two roads in Portland, one in Washington and one in Southern California are being stocked with the Low adjustable patent cars. Carter Bros. of Newark and the Stockton Car and Agricultural Works are prominent builders. Mr. Low states that the company has no agents except himself. No manufacturers have exclusive rights. Owners of roads paying royalty get the cars manufactured where they please at present.

THE Union Mill Company of Tuscarora district, Nevada, has organized with the following directors: Thos. Bell, P. C. Hyman, Geo. W. Grayson, E Scott and F. A. Berlin. Thomas Bell has been appointed president, P. C. Hyman vice-president, R. R. Grayson secretary and H. W. Coffin superintendent of the mill. The Union mill is owned by the Commonwealth, North Belle Isle and Nevada Queen Mining Companies, each of which holds in its treasury one-third of the 100,000 shares of the capital stock of the mill company. On October 1st the mill, which is now being run by the Commonwealth Company for the owners, will be turned over to the new company, together with all supplies, etc. The rate for working ore has been established at $25 per ton.

WELL DONE.—In the U. S. Senate on Tuesday of this week, the House Anti Lottery bill was taken from the calendar and passed without a word of discussion.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD.—*Ledger*, Sept. 20: Company have received the following cablegram from James E. Dye, agent at the mine: "Mill has run 60 days to August 1st; 45 stamps running day and night; 6750 tons of ore have been treated. Net profit to Amador gold mine (limited) $30,000." The above is a remarkable showing, if true. The managers never calculated upon ore exceeding an average of $4 per ton, yet according to the above report the profits of the first two months amount to over $4.50 per ton. We hope the dividend of sixpence per share just declared is the result of actual mining. Stockholders in England have written us in regard to the genuineness of this action of the company, and we regret that we are not in a position to set doubts on this proposition at rest.

SUTTER CREEK.—Cor. *Ledger*, Sept. 20: Grading for the additional ten stamps at the Wildman mill was finished to-day. The carpenters are busy framing the timbers. Knight & Co. have contracted to have the mill in running order by the first of November. The completion of the ore bin has been somewhat delayed on account of being short of one or two large timbers. Superintendent Tregloan informs your correspondent that he is confident of having everything in operation before the winter rains set in. Drifting at the North Star has commenced in earnest. Two drifts in almost opposite directions have been started, with three eight-hour shifts, and work is to be pushed with all possible speed.

FROM VOLCANO.—Mining in this district has been somewhat at a standstill for some time, but there will be a great change this coming winter, as they have been hauling logs and blocks all this summer for the Tunnel Co. I hear that they intend to employ about 25 more men.

DRYTOWN.—Mining in this district is nearly at a standstill. The only claims being worked in the immediate vicinity are the Gover and Tip Top, a new company composed of M. C. Randolph, Fred Bockers, Henry and Milton Dickerman, who are doing some prospecting near the Black Hills. They have fitted up the Seaton mill and will begin crushing rock some time this week. They expect to take out some tip top rock, hence the name.

Calaveras.

MILL RUNNING.—Calaveras *Chronicle*, Sept. 20: The 10-stamp mill of the Sandy Bar Mining Co., which has recently been completed, commenced to drop stamps steadily this week.

Inyo.

SYLVANIA DISTRICT.—Cor. Inyo *Register*, Sept. 18: Several changes have been made in the management of the Sylvania Co.'s affairs here. Work has been resumed on the Climax mine, and the tunnel is being extended toward the ledge as fast as three eight-hour shifts can push it. A day shift is also sinking a shaft on the ledge and taking out ore. The shaft on the Liberal mine has been straightened to a perpendicular and substantially timbered. Friday, the 12th, was a day that should be recorded as an important one in the history of Sylvania mining district. During the forenoon Engineer Jas. Knapp got up steam, and shortly before noon quite a crowd of Sylvanians gathered at the Liberal shaft. At 11:40 Mrs. George Futler, one of Sylvania's handsome ladies, placed her hand upon the throttle valve and had the honor of being the first one who ever caused an engine to turn a wheel in Sylvania district. At 12 o'clock all the ladies in the camp took hold of the whistle cord, and with a "strong pull, a long pull and a pull altogether," they made the hills ring with reverberations from the first steam whistle that ever sounded in Sylvania district.

BEVERIDGE DISTRICT.—Some rich ore is being taken out in Beveridge district. Recently J. Stansbury sent down several tons that netted 367 ounces silver per ton. A miner named Jolhurque sent out a lot that paid him 373 ounces per ton. This ore comes from a short distance east of the Keynot mine.

Mariposa.

ANOTHER QUARTZ-MILL.—*Gazette*, Sept. 20: The new mill at the Malone mine started up last Wednesday and the prospects are good for a successful run. They have good rock, and it is said, enough of it to pay the owner handsomely. The Malone mine gives employment to about 20 men, which is quite an item these dull times.

Modoc.

CEDARVILLE.—Cor. Aden *Argus*, Sept. 20: A gentleman has begun work on what is known as "Forty-nine" ledge, in "Forty-nine" canyon, directly east of Cedarville. Twenty-four years ago, while on a prospecting tour through this region, he found the ledge and sunk a shaft 50 feet deep on it. He then abandoned operations and left the country; and now the whirligig of time brings him back again to renew the labor of 24 years ago. He is very sanguine and has men at work running a tunnel into the shaft to drain it of the water. He says the ore he took out of the shaft assayed over $40 per ton, and he looks for it to grow richer as he goes down on it.

Nevada.

SPECIMENS FROM THE SEVEN-THIRTY.—*Tidings*, Sept. 20: Wm. Hammill, who, with John Rawling, James McLachlan and others, is opening the old Seven-Thirty mine on Deadman's flat, under lease, brought to town to-day a quantity of very rich rock. The ore came from a 10-inch ledge at a depth of 140 feet and is "lousy" with coarse gold. In character the quartz is dark and water-stained, and, filled with gold as it is, it reminds our old citizens of the early days of the Seven-Thirty, when a fortune was taken out from the superficial workings. For three or four months Messrs. Rawling & Co. have been doing deadwork, and now they are prepared to go right ahead with operations on the ledge.

YOU BET NOTES.—We learn from Jerry Goodwin that about 40 men are working in the You Bet drift mines, and all making good livings. Mr. Feely employs 18 men, having cut his force down from 30, the necessity heretofore existing for doing considerable deadwork having been overcome. The mine is paying. Mr. Goodwin is opening his old mine and as soon as the necessary preliminary work is accomplished will give employment to quite a number of men.

HARTERY MINE.—Grass Valley *Union*, Sept. 20: The Larimer mill, leased by the Hartery Co., began the work of crushing ore from the mine this morning. There is considerable ore on the dump at the mine, probably about 50 tons, and it will be put through as rapidly as possible. The Hartery is clear of water and it takes but a very slow movement of the pump to keep it so. Ore is now being taken out of the north and south drifts of the 600 level, where stoping is going on. The ore now being hauled to the mill is not up to the average ore in the mine by any means, and is only expected to pay a little more than expenses.

Plumas.

PIPE TO LITTLE JAMISON.—Greenville *Bulletin*, Sept. 20: Last week G. P. Cornell went to Big Meadows and purchased 2000 feet of 22-inch pipe belonging to the Dutch Hill mine. Teams have been engaged to haul it to the Little Jamison mine, where it will be used in supplying water-power to that property. Mr. Cornell is pushing work on the Little Jamison as fast as possible. About 75 men are now at work. The company is building hoisting works and sinking a shaft.

THE LITTLE JAMISON.—This mine is situated on Little Jamison creek on the opposite side of Jamison creek from the Eureka, of which it is supposed to be an extension. It was discovered many years ago and worked as a gravel mine. A few years ago, while so working it, a large ore vein was discovered in the bed of the creek. This ledge is supposed to have been the feeder of the rich gravel deposits below. The property became involved in litigation, and not until a few months since was it extricated. G. P. Cornell succeeded in harmonizing the factions and consolidating the interests, and now the work of developing the mine is progressing very favorably. A chain of four small lakes, already connected by Nature, will furnish ample water for all purposes. A force of men is now cutting a ditch from the lowest of the series of lakes, round to a point on top of a hill, near the mine. This will give 500 feet pressure and furnish, without exception, says the engineer, the finest water-power in the county. The object of the large flume is to take up the waters of Little Jamison creek, above the mine, so as to drain the property. The flume will be about 1000 feet long. About 50 men are now employed doing preliminary work. Mr. Cornell is the head of the company; Thos. Jenkins, secretary; T. B. Inch, treasurer; and Mr. Stanley, the local superintendent.

San Diego.

AT JULIAN.—*Sentinel*, Sept. 19: J. J. Minear, who purchased a group of mines between Julian and Banner, will arrive this week with a complete outfit for working the property, including a quartz-mill. He also brings his own wagons and teams. The outfit is in charge of six men. Such additions to our already lively camp are always welcome.

Shasta.

IGO.—Cor. Shasta *Courier*, Sept. 20: Robinson & Co. are still crosscutting from the bottom of their shaft and intersecting numerous seams of clay carrying some mineral. P. Gibney has all his claims surveyed, and will apply for patents in the immediate future. Shirland's arastra is running on Creighton ore. E. L. Ballou's arastra is running on ore from his Manzanita ledge. Litten & Moody are building an arastra between the old Continental and Chico mills to run on ore from the Continental, and surface ore from several other claims adjacent thereto. The Euhanks boys are building an arastra on Andrews creek, above their house, to run on Live Oak ore. Doc Dunham has bought out Whit George at Muletown, and is shipping sulphuret ore. Whit George, Hopping & Co. are drifting on their ledge with good results.

Sierra.

EXTENSION TUNNEL. — *Mountain Messenger*, Sept. 20: Thirty feet were made, last week, in the Bald Mt. Ex. tunnel. A hard spur of rock, 16 feet wide, was passed when soft quartzite rock, sparkling with sulphurets, was encountered and water increased. The tunnel is in about 4631 feet, crossing the ridge, headed west, and is probably near to or in the rim of the channel. The track is planked and mules haul out the trains. A two-foot quartz ledge was lately struck. Supt. Meikle has returned from Nova Scotia and resumed charge of the mine. Under his careful and energetic management the Ex. Co. is slowly but surely pressing on to glorious victory that none will begrudge the tireless and ever-persevering stockholders, who have never failed to pay off their men at the close of every month, settle all other indebtedness on or before it was due, nor employed a Chinaman in more than 17 years of extensive drift mining—a record of which they may well be proud—one of the most honest and deserving home companies ever incorporated in Sierra county. During the absence of Supt. Meikle, work has progressed satisfactorily under the able supervision of J. A. McDougall.

THISTLE SHAFT, a mile and a half below Gibsonville, is down about 400 feet, through pipeclay to gravel, with 13 more feet of pipeclay below, after which all will be gravel. Just now 150 gallons of water a minute is being pumped out of the mine, temporarily retarding work. The recent cleanup at the Wm. Tell quartz mine, probably an extension of the Sierra Buttes ledge, Sierra City, for the past three months was $1400, with a small working force. W. M. James is reported as having returned to Sierra City from Shasta county to remove his family to that part of the State, where he is superintendent of the Uncle Sam quartz mine, near Redding, owned by the Sierra Buttes Co.

Siskiyou.

ORO FINO.—Siskiyou *Telegram*, Sept. 20: The Allen Bros. mine has yielded an average of $43 to the ton all this season. They have about 600 feet of the same kind of ore to stope out. They reduce the ores in two arastras. Wright & Fletcher will soon begin to fix up for next season's work. Eastlick Bros. will also soon be at the same work. R. H. Campbell started in last week to open up the Hull Gulch mine in Quartz valley. He will drift the Luke Shaw mine and hydraulic the Hull gulch. He ordered 60,000 feet of lumber from Morrison's mill for flume purposes, and it will take at least three months to get the same in order for mining. The Luke Shaw mine prospects better than ever at present. Theodore Demming will soon commence operations at the Gardner mine in the Pinery.

QUARTZ AND RIVER MINERS.—Yreka *Journal*, Sept. 19: Fagundus & Co., who own a quartz ledge in the Salmon river section, near the old Klamath ledge, have been taking out very rich quartz lately. The Schroeder & Werner ledges on Deadwood still continue to pay handsomely, a large force of men being employed day and night, with the steam mill running constantly. The river miners on the Klamath are all down to bedrock in the old channel, and we may soon anticipate a great amount of gold dust from that section. The Spencer mine at Humbug Creek still continues to yield rich pay from quartz taken out. Over 50 tons have been crushed lately in McCook's mill at Forks of Humbug, 24 of which were bedrock and porphyry, the latter paying about $50 a ton, while the quartz paid over $80 a ton. The ledge is from 3 to 4 feet wide, and appears to be gradually improving as the work of going down deeper progresses. It is the best paying quartz mine in the county at present, and this fall a large new quartz-mill is to be erected, and a larger force employed to work the mine. The Boyle & Co. quartz mine at the head of Humbug is also paying handsomely, their mill being kept in constant operation day and night.

Tuolumne.

POCKET.—Tuolumne *Independent*, Sept. 20: A $2000 pocket was taken out of the old Fuchs mine at Sawmill Flat recently. This mine is now the property of Dave Oliver of Sonora.

THE ALAMEDA.—Mr. M. B. Harriman has become sole owner of the Alameda mine, on the mother lode near Jamestown. The mine contains a large body of high-grade ore, and is undoubtedly a valuable property. Mr. Harriman intends to develop this mine as soon as his lease on the Bonanza mine expires.

GOLDEN GATE.—Messrs. Hayward & Hobart, well-known mining men, were in town this week negotiating for the purchase of the Golden Gate mine. Whether they succeed or not is not definitely known. It is rumored that they have offered $350,000 for the property, if after sinking 300 feet deeper, the mine suits them as well then as it does now.

NEVADA.

Waehoe District.

ALTA.—Virginia *Enterprise*, Sept. 20: Drifting northwest from the winze on the 1000 level. Stopes yielding 318 tons of ore weekly of the usual value, all of which is being crushed.

LADY WASHINGTON.—Crosscutting on the 825 level of the New York shaft, and cutting quartz stringers assaying from $1.50 to $11 a ton. It is believed that by following the strongest of these stringers in their depth, a strong body of ore will be found.

CROWN POINT.—The 300 east and west stopes look about the same as last week. The rock is still low grade, but hope in a few days to reach a point in the west stope on the sixth floor, below which the ore is of much better quality, and which we expect to find extending upward. Shipped to the mill during the week 398 tons and 1480 pounds of ore, the average battery assay of which was $12.40.

BELCHER.—Shipped to the Vivian mill during the week 274 tons 900 pounds of ore, the average battery of which was $31.68. This battery does not represent the value of the ore in the stopes, but is due to the shipment of the ore that has been stored on the 1300 level since the latter part of 1887, and which was extracted from the rich streak in the 1300 raise at that time. This is the first opportunity we have had to mill it.

ANDES.—During the past week on the 420 level the north drift from No. 1 crosscut was extended 6 feet; formation, porphyry and quartz. A south drift is started from No. 1 west crosscut, and is out 10 feet; formation quartz, giving low assays.

CON. IMPERIAL.—The raise from west crosscut No. 2, 750 level, is up 13 feet, having been commenced during the week; the top shows quartz of no value. East crosscut No. 1 and west crosscut No. 1, 1000 level, are being repaired.

CHALLENGE CON.—The joint Yellow Jacket and Challenge west crosscut No. 1, on the 1000 level, is out 92 feet, having been advanced 28 feet during the week, the face showing quartz of no value.

YELLOW JACKET.—Shipping 80 tons of ore daily to the Brunswick mill, and doing very extensive work throughout the mine. Are employing 180 men in the Jacket, Challenge, Confidence and Imperial.

OVERMAN.—Extracted 240 tons of ore; car samples average $18 per ton. Shipped to the Brunswick mill 317 tons and 1760 pounds of ore. Battery assays, $17 per ton. On the 1100 level the incline upraise from the south drift has been extended 8 feet; total, 48 feet, with 2¼ feet of good ore showing in the face of the upraise.

JUSTICE.—Shipped to the mill during the week 196 tons and 1225 pounds of ore. Average battery assay, $25.29 per ton.

SAVAGE.—On the 1300 level the southeast drift from the Savage shaft was advanced 293 feet and connected last Saturday with the north drift from the Hale & Norcross side. This connection has greatly improved the ventilation on this level. In about a week we will have this drift timbered and prepared so that we can commence extracting ore through our own shaft from the new find on this level. During the week we have hoisted from the 500, 600, 750 and 1300 levels 902 cars of ore; shipped to the Rock Point mill 385 tons and to the Mexican mill 388¼ tons. The Rock Point milled 295 tons and the Mexican 388 tons; total, 683 tons. Average battery assay, $18.63. We have bullion on hand and at the mill amounting to $19 300.

HALE & NORCROSS.—On the 900-foot level the west drift was advanced 35 feet. The face is in vein material. We have resumed work in the face on the north drift on this level, and advanced the same 38 feet. On the 1100-foot level the west drift was advanced 35 feet. This drift has passed through 25 feet of quartz giving low assays. On the 1350 level the west prospecting drift 60 feet north from the station was advanced 25 feet. The face is in porphyry. The east crosscut opposite the shaft on this level was advanced 25 feet. The face is in porphyry and stringers of quartz. Ore shipments were discontinued on the 8th inst. During the week we have hoisted 16 cars of ore; shipped to the Nevada mill 105 tons and milled 170 tons. Average battery assay, $10.47 per ton. We have bullion on hand amounting to about $7200.

UTAH.—The main south drift has been extended 49 feet, total, 58; continuing in porphyry showing clay slips.

OCCIDENTAL.—The stopes on the 400 level, and particularly on the 4th floor, are yielding ore of good quality. At a point in the north drift on the 400 level, about 200 feet from the north line in, a winze has been started in high-grade ore. On the 400 level good ore is being extracted from the 6th and 8th floors. We are now getting the mill in order, and expect to start crushing ore on or before October 1st.

BEST & BELCHER.—At a point in raise No. 1, 45 feet above the 1200 level, west crosscut No. 1 was started and advanced 20 feet; formation, clay and porphyry.

CHOLLAR.—The pay stopes are yielding the usual amount of ore giving the average assays. Sent to the mill 470 tons of ore, the average battery assay of which was $18.98 per ton.

POTOSI.—Have completed timbering 1130 winze station, and started lateral drifts north and south from the west of the pay. They are in 12 feet; face in porphyry with seams of quartz through it. Have resumed sinking the winze, which is down 397 feet. The bottom is in porphyry, clay and quartz.

ALPHA.—Southwest crosscut, 600 level, is out 209 feet; face in hard porphyry. No. 3 northeast crosscut, 600 level, is out 12 feet; face in quartz and porphyry.

WARD COMBINATION SHAFT.—East drift on the 1800 level is out 556 feet; face in porphyry.

Columbue District.

LOOKING WELL.—Inyo *Independent*, Sept. 20: Holmes and Mount Diablo mines at Candelaria are reported to be looking first rate. There are large ore bodies in sight in both mines and ore can be taken out faster than the mills at Belleville and Candelaria can work it. Candelaria is reported to be very lively, with fine prospects for the future.

Eureka District.

STARTED UP.—Eureka *Sentinel*, Sept. 20: The Eureka Con. Co. will start up their smelting works to-day. The works have been closed down some two weeks for the purpose of making needed repairs. They have a four months' supply of ore on hand at the present time, and will probably make a continuous run up to next spring.

Pioche District.

CONSOLIDATED.—Pioche *Record*, Sept. 13: The incorporation of the Pioche Consolidated Mining and Reduction Co. is completed, and hereafter the management of all the company's extensive properties will be under one distinct head. The new incorporation is organized under the laws of Utah Territory, and its mines and works are at and near Pioche, Nevada, and include all the various mines and works acquired and constructed by the Pioche Consolidated Mining Co. and the Yuba Mining and Reduction Co., since those two companies began operations here several years ago. The new incorporation consists of 2,000,000 shares, and under the distribution of new stock, each holder of old P. C. stock will receive an equal number of the new shares, while the holders of the Yuba stock will receive for each of the old shares three of the new. This consolidation was effected to secure a more uniform and thorough working of the various properties of the two companies, which are closely dependent upon each other. Among the first steps of the new incorporation will be the reopening and working of the old Meadow Valley No. 5 shaft. This shaft is at about the middle of the old Meadow Valley claim. The No. 5 is a double-compartment shaft and was sunk to the 1200 or water level, but was never used, the company ceasing active operations before the hoisting works and engines were fairly ready for use. The double-acting hoisting engine then placed was considered at the time one of the finest on the coast. It was tested for a few hours only, and stands now ready for use, completely new. At this shaft also, the 14-inch Cornish pump was to be placed to work in conjunction with the present pump at the Raymond shaft. The excavation for the foundation stands ready, and tons upon tons of the necessary pump castings were freighted in and now lie about the works. This was 14 years ago, and now under a new management, the old place is to resume active life. No. 5 will be the shaft through to work the Yuha, Mazeppa and other mines on that ledge; also the Meadow Valley and part of the old Raymond & Ely. A crosscut of 150 feet only will connect the shaft with the Yuha or Mazeppa ledge, along which the company will run until the workings of the Yuba are reached.

Tuecarora District.

NAVAJO.—*Times-Review*, Sept. 19: Stopes on the 150-foot level are looking well and are yielding some very good ore. Stopes on the 250-foot level are without material change. The water is now down to the 450 station.

NEVADA QUEEN.—North drift from North Belle Isle line on 500-foot level, is in 23 feet. The ore has increased in width, showing high grade the entire distance.

DEL MONTE.—First level—North drift has been advanced 10 feet through hard porphyry, water not so strong. Intermediate drift from top of No. 1 joint raise has been started on the line, showing three feet good ore.

NORTH BELLE ISLE.—Stopes on the 150-foot level continue to produce the usual amout of ore. Concentrator was shut down 37 hours for repairs, but is running all right again now.

BELLE ISLE.—No. 1 east crosscut from north drift, 250-foot level, extended 15 feet, face is in low-grade quartz. No. 1 upraise same level extended 7 feet, and a crosscut west from the top of the same extended 9 feet, face in low-grade quartz. West crosscut near same upraise extended two feet; the ground looks favorable.

COMMONWEALTH.—All the stopes look as well as at any time heretofore and yielding full quantity of ore. Hoisted 364 tons during the week. Worked at Union mill, 105 tons Commonwealth ore, battery assay $177.95 per ton. Sent to the concentrator 173 tons. Bullion shipped, $27,934.29; crude bullion on hand, $11,000.

NORTH COMMONWEALTH.—Hoisted 757 cars of ore. Worked at Union mill 61 tons, sent to concentrator 600 cars, worked 433 tons, made 68,000 pounds concentrates. Mill is running on company's ore, doing good work.

Wild Rose District.

CONCENTRATES.—*Silver State*, Sept. 20: The Paradise Valley's Co.'s team arrived yesterday from the mill with 22,000 pounds of concentrates. The

ore which produced the concentrates was mined by men who have leased the Paradise Valley Co.'s mines.

ARIZONA.

AT WORK.—Prescott *Courier*, Sept. 19: Intending purchasers of the Jennings group are busily at work prospecting the principal veins. That they will purchase is said to be almost certain. Frank Carlisle, of the Black Horse mine, returned home recently from the East. Talk is that he will at once start the mine. Prospectors, on Saturday last, exhibited to us encouraging assays of a new find. Assays were made by Mr. Hetherington. There was at the Bank of Arizona, Saturday last, a bar of silver said to have been worth $1500. It was brought to Prescott from the Tuscumbia mill, which is being run by S. G. Mott. Silver was taken out of Prince and Black Warrior ores.

COPPER AT JEROME.—Cor. Prescott *Courier*, Sept. 20: Jerome is a very prosperous mining camp, having enough copper ore in sight to last 50 years. It has a new and improved smelter and employs about 150 men. The camp affords a good market to farmers of the Verde for the sale of their produce. They want a railroad to this camp from Flagstaff, thence by the way of the Black Canyon, touching the Bradshaw mountains, to Phœnix. From Mr. Head, the merchant at Camp Verde, I learn that about ten tons of freight is received at this camp daily, and about the same amount shipped. On the whole, the outlook for the above-named section is very promising.

COLORADO.

MINE LEASING.—Elk Mountain *Pilot*, Sept. 20: Mine leasing seems to be the only solution for the development of the mines in this locality. It is the means by which the mines in the older districts in the northern part of the State were developed. Those who have been in Colorado since the early days will tell you that there was a time when Georgetown, Central, Black Hawk and other camps in Gilpin and Clear Creek counties were almost depopulated. Those who did remain almost gave up hope of ever seeing any mines developed. Miners began to take leases wherever they could, and foot by foot, as it were, the country began to be developed. So it will be in this country. Of the dozen or more mines in this locality that have fallen into the hands of capitalists not more than two or three are being worked, while leasers are getting in on leases wherever they can. The difference between the mine leaser and the mine capitalist is that the leaser is generally poor and has to make at least wages out of the lease, while the capitalist usually has a surplus that is placed at the disposal of some inexperienced person to make extravagant experimental developments. After all this is expended then the owners are ready to quit and pronounce the mine a failure. The owners, being able to live without the benefit of the mine, shut it down and [illegible] for years, a drawback to the country.

DAKOTA.

THE CALEDONIA MINE.—Deadwood *Pioneer*, Sept. 19: Supt. Skinner has put into practice a theory of his own, and aided by Nature, has been successful. The main workings are really comprised in a stope 600 feet from roof to floor without a single timber, the only support being pillars of ore. Were it not for the extreme hardness and tenacity of the ore this could not have been accomplished with safety to the miners; but in the Caledonia, Nature has provided for their safety, and no uneasiness is felt by any as to the caving of the roof 600 feet above them. At the present time the miners, under Foreman Blatchford, are drilling holes for an immense blast to be shot off when the present supply of ore from a blast exploded three weeks since is exhausted. At that time 200 pounds of giant powder was used, but in the one now being prepared 1000 pounds will be used. There are 30 holes of an average depth of 14 feet already drilled. These will be charged, and the shot fired with a battery. Mr. Blatchford estimates that ore sufficient to run the mills for months will be displaced, and past experience tells him that no disastrous results will follow. To stand on the 500-foot level and see that immense stope lighted up with torches at each level, as we did, is indeed a grand sight, one never to be forgotten. Taking the face measurement of all the veins at present being worked, the average width is 125 feet, the average yield about $4, and the average depth so far as has been developed at present about 660 feet. Below the 500-foot level, though, only prospect work has been performed by means of a winze sunk from that level, and crosscuts at the bottom. It is thought to be the only mine in the world to-day where such extensive workings have been performed without timbering.

IDAHO.

THE HIDDEN TREASURE.—Wood River *Times*, Sept. 20: Charles Sherry sent a load of supplies and two men out to the Hidden Treasure mine, in Smoky, to-day, to resume work there. The Hidden Treasure has had considerable work done upon it, and shows a great deal of ore. In the shaft, at a depth of 138 feet, the ore vein is three feet thick; in a tunnel driven 130 feet west of the shaft, there is a thickness of two feet of ore. The chute is therefore at least 160 feet long by 150 feet in depth. The first work to be done will be to connect the tunnel with the shaft for air. Then men will be put to work to stope to the surface. In this way a few men can extract fully 1000 tons of ore by next spring. This ore is low grade, carrying about 70 per cent lead and 30 ounces of silver per ton. Heretofore this ore, after paying all expenses, only left a profit of $15 to $20. But under ruling prices for lead and silver it pays about $30 per ton, and by next spring it may pay as high as $75 per ton.

THE GALORE-STORMY GROUP OF MINES.—The increasing value of lead and silver is causing a resumption of operations on many good properties which have heretofore lain idle. The Galore-Stormy group, in Smoky, is one of these. Frank Massey and John Newkirk left for that property last Monday with supplies, and will immediately lay in enough to last four men all winter. They have taken a contract to connect the lower tunnel (which is already in over 450 feet) with the vein, to then raise to the upper tunnel for air, and to continue the drift in the vein from 250 to 400 feet, according to the character and condition of the vein. The Galore-Stormy has yielded about $60,000, much of this being ore that sold for over $500 per ton, in carload lots.

THE SEVEN DEVILS.—Cor. Salt Lake *Tribune*, Sept. 20: Messrs. N. Treweek and W. H. Remington have just returned from a trip to the Seven Devils country. The country is reached by train to Weiser, thence 105 miles up the Payette, Indian creek, etc., over the divide to the mining region. On the last ten miles of the road the Montana Co. owns the Peacock, and under charge of its agent is improving it to a good stage; so the way to get into the country is plain. Messrs. Treweek and Remington find a primitive community there, who have been long waiting to have an outlet for their ores, although they have not done much work on the ledges. The veins are contact and very wide, the Peacock being the center of an upheaval system extending outward and embracing mines in every direction. The claims are all 600 by 1500 feet in size, and the ore is such as to give validity to the claim of value underground. Every indication proves the great value of the camp. The party from Salt Lake City made a little original exploration, but they found the center of the deposits and bonded (for 30 days at favorable terms) five claims, the North Peacock, Confidence, Steamboat, Walker Placer and Black Garnet, each 600 by 1500 feet. The ore in each, and especially in the Confidence and North Peacock, is of a very lively character, showing high assays. The camp is a copper proposition, the ore going an average of 25 per cent copper, besides the silver and gold. Mr. Kleinschmidt of Helena, Montana, went in there four years ago and took the Peacock claim for the central ledge. He has been shipping rich ore from there ever since. The North Peacock, Confidence, Steamboat, Walker Placer and Black Garnet were bonded for 30 days by the Salt Lakers, and the samples of ore shown are very favorable. Mr. Treweek says he will put a shaft down 200 feet on the Confidence, and will push development as needed without shipping any ore. A Boston company with plenty of capital has the South Peacock and other claims that show well. It is altogether a fine showing.

LOWER CALIFORNIA.

CEDROS ISLAND.—*Lower Californian*, Sept. 20: The Pacheco arrived yesterday from Cedros with 123 tons of ore from the mines. It is reported that 62 men are now employed at the two camps. The buildings owned by the Mining Company, including a neat office at the lower camp near the steamer landing, have been nicely painted and the camp presents a better appearance than ever before. The men at work in the tunnel have struck the vein at 349 feet, and the ore is said to be fully as good as that nearer the surface.

MONTANA.

CARDWELL DISTRICT.—Boulder *Age*, Sept. 19: A. H. Hadley recently shipped from some of his mines in the Cardwell district to Butte, 8 tons of ore, and these returned him $2100. He has some very promising prospects in the district. J. C. Sloss was in town Saturday and reports preparatory work going on for the development of the properties in the Cardwell district recently bonded by him. He has also shipped a couple of cars of ore to Butte, but the returns from them have not yet been received. Uncle Ben Mason has sold to John G. Howard and brother the Latrobe mine, over the Montana Central tunnel, for $3000, and has bonded the Virginia Belle and its extensions to the same gentlemen for $14,500, the bond to run 16 months. The Howard brothers will immediately proceed to the full development of these very promising properties.

THE ALICE.—*Inter-Mountain*, Sept. 20: The Alice mill and the mines of that company are being run to their full capacity. This gives employment to a large number of men and they in turn give life and vigor to the town of Walkerville. The Alice mine continues to be developed on the 1100, 1200 and 1300 foot levels and reports from all of these are of a very favorable character. The Blue Wing is taking out its regular quantity of ore and the Magna Charta continues to be the stand-by of the company, ore being taken from all its levels to the 600.

THE MOULTON.—The mill of the Moulton Co. has been temporarily shut down pending the rebuilding of its stack, which was demolished by the runaway engine on the Montana Union last Sunday night. The mine is working its regular force and doing all the necessary work making ready to push the abstraction of ore as soon as the stack is completed, which will take at least 20 days. This is the only mill of any importance in the whole camp that is in a state of idleness at the present time.

BUTTE & BOSTON.—The depth of 700 feet has been reached in the West Gray Rock and sinking continues below the 600 in the east shaft. The East Silver Bow is down 500 and the whole of the mining property of the Butte & Boston is in excellent shape, with bright prospects for the future. The huge machinery for the new concentrator is fast arriving and being placed in position. When this plant is completed it will be the largest in the county.

THE BLUE BIRD.—This company is adding miners from day to day and it is expected that the machinery of the big mill will commence Monday on ore. Every preparation is being made and it is thought they may be completed by that time. The change will not be without its effect upon Butte as well, for it will mean employment for nearly 500 men and a monthly output of bullion that will be far more valuable now than ever, owing to the advance in the price of the white metal.

NEW MEXICO.

LAKE VALLEY MILL.—Silver City *Enterprise*, Sept. 20: John M. Wright and C. H. Wilkie returned this week from Lake Valley, having inspected and purchased the Lake Valley mill. The plant will be removed immediately to the Last Chance mine in the Mogollons. The crushers will give way to 20 stamps and the mill otherwise adapted to the treatment of the Mogollon ores. The Good Luck mine at Lone Mountain continues to grow richer and the ore body more extensive with development. Last Friday another car of very rich ore was shipped to Denver.

BIG PROFIT IN LEAD ORE.—Last week H. J. Hutchinson of Central returned from Socorro, where he had taken a carload of 19¼ tons of lead ore. The ore averaged 55 per cent and 8¾ ounces silver per ton. Gross returns, $744.95; freight, $56.42; net returns, $688.53. This shows what may be done with our lead mines even though low in silver.

PYRAMID.—The Humboldt Co. of Shakespeare are now figuring on a new process for working their ore, and if it is demonstrated that it can be made a success, they propose to revolutionize the mining industry in that thriving hamlet.

HACHITA.—Hachita camp is quite lively. There are about 25 men at work in and about this camp. The American mine is working about 14 men and could work as many more if they had teams to take the ore out of the way; the dumps are full of good ore. The Hornet is working every day with good results.

OREGON.

CINNABAR.—Jacksonville *Times*, Sept. 20: The work of reopening the cinnabar mines on Wagner creek goes on gradually but surely. Philip Mullen, who is prospecting a promising ledge on the Siskiyou side of the mountains, is making a favorable showing. Root & Boswell, who bonded Dr. Braden's mines near Gold Hill, have a large force of men at work and are realizing five ounces and upward a day. From the Mountain Lion mine in Josephine county a good quality of ore has been taken for some time past, and a quartz-mill will soon prove its richness. Lack of water has compelled Henry & Messenger on Horse creek to suspend their arastra for a time, and they are now at work on their shaft and tunnels. Logg, McDonell & Atterberry of Forest Creek have finished a ditch that covers some excellent mining ground, and will furnish them a liberal supply of water. Ennis & Cameron are building a large reservoir at their Galice creek mines and making general preparations for the winter. They will be able to commence piping as soon as the reservoir is finished. The Waldo copper mines in Josephine county have been bonded by a party of San Francisco capitalists. The assays on this mine from four different samples average 40½ per cent. Some work has already been done, consisting of one tunnel 70 feet in length and a shaft of 50 feet, which shows a large amount of rich-looking ore.

THE CINNABAR MINES. — Ashland *Tidings*, Sept. 13: Large bodies of rich cinnabar ore in the Siskiyou mountains southwest of Ashland and Wagner buttes attracted the attention of prospectors years ago, and considerable quicksilver has been taken out of mines there. Messrs. Henry Klippel and M. Caton, of Jacksonville, operated the Emmeline cinnabar mine there some years ago, and took out some ten tons, but having no facilities for working the ore to good advantage, they suspended operations. Recently Mr. McGee went out to examine the property of the Emmeline Cinnabar Mining Co., and was so much pleased with the character of the ore and the good prospects generally that he and Francis Fitch, of Medford, have bonded the mines for a year, and are now employing a number of men in running tunnels, sinking a shaft, ground-sluicing and other prospect work. The prospects are reported to be satisfactory, and it is believed that the work of obtaining the quicksilver from the ore will be commenced before winter with such means as may be possible for temporary operations. The operations of these mines upon a large scale would be of vast benefit to Jackson.

UTAH.

A NEW SMELTER.—Salt Lake *Tribune*, Sept. 19: There are strong rumors that a still stronger combination is preparing to build a new smelter near Salt Lake that will secure ore producers better prices for their ores; prices corresponding to the recent reduction in ore rates made by the Union Pacific to Salt Lake City. The principal complaint at present seems to be that while freight reductions from the north are nearly 100 per cent under former charges there are no indications that the cost of smelting will be reduced. A lower scale of charges must be reached to make this point what it should be in case the smelters refuse to make any reduction. It is possible that a combination of the ore producers and local capitalists will unite with Eastern capitalists in erecting a great smelter, capable of handling the ores of Utah, Nevada, Idaho and Southern Montana. The need of a great smelter is further evidenced by the fact that at least three railroad lines are preparing to start for salt water within twelve months, from Salt Lake City, and just as soon as they reach Nevada the ores will begin to pour into Salt Lake.

BULLION RECEIPTS.—The receipts of the minerals in this city for the week ending the 17th instant, inclusive, were to the total value of $218,423, of which $123,628 was in ore and $94,825 was in bullion. For the previous week the receipts were valued at $327,921, of which $248,420 was in ore and $79,501 was in bullion. The product of the Ontario for the week was of bullion, 22,152.54 silver ounces; in ore sales (three lots, 12th, 15th, 16th), $23,780.20, an approximate total of $45,932.74. The Daly yield for the week was in sulphides sold, 75,087.37 ounces silver; 59,508 ounces gold; realized $84,954.54. The Horn Silver election was held on Tuesday last, and resulted in the continuation of the management that has controlled the past year. Bullion receipts in this city for the week were valued at $32,200; gold dust, $800; gold bar, $900; silver bars, $14,000; selected lead, $1175. The Hanauer smelter produced during the week bullion valued at $45,750. Ore receipts in this city for the week were to the value of $55,206 by Wells, Fargo & Co.; $60,217 by McCornick & Co.; and $8205 by T. R. Jones & Co.

WASHINGTON.

THE SMELTER.—Tacoma *Ledger*, Sept. 16: Fire was started yesterday morning in the crucibles of the first stack to be at the works of the Tacoma Smelting and Refining Co. Forty-eight hours will be required to get the crucible in shape for the ore, and then the blowing-in process will be complete. The fire thus started will be kept burning for an indefinite length of time. Once started the fires must be kept up, with shut-downs for repairs only, or to secure an additional supply of ore; but the Tacoma smelter has ore enough on hand already to keep several stacks going for a long time. Additional consignments are coming in daily from all parts of the country. In the course of a month or six weeks another stack will be started. Each stack will smelt 50 tons of ore daily. The capacity of the smelter will be increased as occasion demands. The roasting furnaces were started a couple of weeks ago and have been running steadily ever since. Fifty men are employed at present in the works.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 16, 1890.

436,623.—APPARATUS FOR MAKING EXTRACTS—Geo. S. Andres, S. F.

436,624.—APPARATUS FOR MAKING EXTRACTS—Geo. S. Andres, S. F.

436,556.—HARNESS LOOP—A. W. Bennett, Portland, Ogn.

436,594.—WAGON JACK—A. T. & A. W. Brann, Dayton, Nev.

436,699.—ROTARY VALVE—P. N. Dellinger, Whatcom, Wash.

436,653.—SUSPENDER CATCH—J. O. Folsom, Canyon City, Ogn.

436,629.—FRUIT PITTER—J. T. Ish, S. F.

436,481.—KITCHEN CABINET—B. H. James, No. Yakima, Wash.

436,459.—LATHE CHUCK—F. McClure, Stockton, Cal.

436,610.—RUNNING GEAR—S. McGarvin, San Jose, Cal.

436,741.—HAY RICKER—D. F. Oliver, S. F.

436,634.—FENCE POST—H. A. Peabody, Ukiah, Cal.

436,642.—DESK—C. B. Towle, Vallejo, Cal.

436,643.—ANIMAL TRAP—White & Murphy, Pomona, Cal.

The following brief list by telegraph, for Sept. 23, will appear more complete on receipt of mail advices:

California—Daniel Best, Sao Leandro, traction engine; Daniel Best, San Leandro, injector; Daniel Best, Sao Leandro, boiler; John Dihrberg, Visalia, water-closet indicator; John W. Eisenhuth, assignor to Electric Vapor Engine Company, San Francisco, explosive engine; Silas Harris, San Francisco, axle machine; John F. Kirby, San Francisco, governor; Nicholas Kramer, Sacramento, car-coupling; John A. Rueger, Sao Francisco, block puzzle; Thomas Scheen, St. Helena, lawn-sprinkler; Andrew T. Sherwood, San Francisco, uterine supporter; Wm. Shipley, San Luis Obispo, door check; Matthew S. Tarkington, Tulare, wire fence stay; Auguste Wagoiere, Los Angeles, electric arc lamp; John H. Watson, Selma, hame hook; Hugh Wilson, Duncan's Mills, lifting-jack. Oregon—John B. Kelly, Pleasant Home, pneumatic railway; William A. Miller, Wapinitala, circular saw; Zatique Penard, Portland, sash-fastener. Washington—Jasper Howe, Tacoma, shipping-receipt books; William W. Shearer, Port Angeles, wire-drawing drum.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR MAKING EXTRACTS.—George S. Andres, S. F. No. 436,623. Dated Sept. 16, 1890. This is an apparatus for extracting from animal and vegetable fibers the fatty acids, oils and other soluble matter which may be contained in said fiber, all of which constituents are soluble in water or more volatile solvents, such as some of the hydrocarbons, bisulphide of carbon, alcohol, ether, etc. The object of this invention is to provide an apparatus of simple construction by means of which extracts may be obtained from animal or vegetable fiber, either in a continuous or intermittent manner, and which may be also employed for more perfectly removing dirt and other soluble matter from the fiber.

APPARATUS FOR MAKING EXTRACTS.—George S. Andres, S. F. No. 436,624. Dated Sept. 16, 1890. The object of this invention is to provide an apparatus of simple construction, by means of which extracts may be obtained either in a continuous or intermittent manner and which may also be employed for more perfectly removing the solvent from the extract either with or without pressure.

SCHOOL DESK.—Charles B. Towle, Vallejo, Solano Co. No. 436,642. Dated Sept. 16, 1890. This is one of that class of school desks which are provided with a sliding or adjustable top, a vertically adjustable seat and a vertically adjustable foot-rest. The invention consists in the novel arrangement relating to these several parts.

ANIMAL TRAP.—Frank White and Frank J. Murphy, Pomona, assignor of two-thirds to said White and one-third to said Murphy. No. 436,643. Dated Sept. 16, 1890. This is one of that class of animal traps designed for catching moles, gophers, etc., and in which opposing spring-controlled jaws are held separated by a suitable trigger which, upon being tripped, allows the jaws to close. The object of this invention is to provide a simple and effective trap of this class having jaws at both ends by which it is adapted to catch the animal coming from either direction.

FRUIT-PITTING MACHINE.—James T. Ish, S. F. No. 436,629. Dated Sept. 16, 1890. The fruit is placed in suitable cups, and as each cup of the series moves forward, the holders are opened and projected toward it, passing on each side. Then they come together on the front and carry it backwardly into position between knives which at this time have separated. Then the knives come together so that their cutting edges divide the fruit, while the points engage the pit of the fruit. When the knives have closed down on the fruit and cut its flesh from the pit, they then separate laterally, so that the points give the pit a kind of twist, while the knives themselves separate the flesh from the pit, and as the knives open again and the holders separate, the fruit is released and falls into a suitable receptacle below.

MECHANICAL PROGRESS

THE WASTE OF EXHAUST STEAM. — The amount of heat that is wasted in the steam that passes out of the exhaust pipe is very much greater than is commonly believed; for every pound of steam allowed to escape into the atmosphere carries with it at least 934 heat units that have been taken from the fuel. The amount lost in this way is a very large per cent of the total heat units abstracted from the fuel and is many times greater than the amount used in doing useful work. By utilizing the exhaust steam for heating purposes the gain will be found to be much greater than the loss from the back pressure necessary to force the steam through the heating coils. When the exhaust is used for heating the feedwater, considerable of this heat is utilized, but as all of it cannot be employed for this purpose there is still considerable of a loss, for every cubic foot of the steam that escapes carries with it 31.75 heat units that might be utilized before the steam would be condensed into water at a temperature of 212°. In multiple-expansion engines considerable more heat is utilized than if the same amount of steam had been used in a simple engine, as the only way in which the heat of the exhaust steam can be utilized is by a transfer of the heat to some body colder than itself. When these facts are fully understood and appreciated, considerable economy may be obtained from the heat of the exhaust steam, permitting only water to escape.—*Stationary Engineer.*

ANOTHER FORM OF COMPOUND LOCOMOTIVE. Mr. Mallett of Paris has recently patented a new arrangement of cylinders for compound locomotives. There is one high and one low-pressure cylinder placed tandem in the center of the engine under the smoke-box. The forward of the two is the high-pressure cylinder. The low-pressure cylinder connects by the usual piston cross-head and main-rod to the rear axle, which has an inside crank. The high-pressure cylinder has its piston extending forward to a cross-head, or more properly, a cross-bar, which connects with crank-pins upon the outside of the forward pair of wheels by means of outside rods. This arrangement makes a cross-head under the front bumper which receives the piston-rod at the middle of its length, and has bearings outside of the frames for the rods. The cross-heads would, therefore, probably be somewhere about 70 inches from center to center of the main-rod bearings. The two parts of driving-wheels are connected by parallel rods, and the relative positions of the two sets of main-rod pins are thus kept 90 degrees from each other. The parallel rods are not placed opposite either main-pin, but half-way between, so that the parallel rod-pins make an angle of 45 degrees with each main-pin.

ADVANCE IN AMERICAN STEEL-MAKING.—The *Iron Age* states that, since the policy was adopted of using none but domestic steel in all the new ships in the American navy, there has been a great advance in the art of making and working steel in the United States. When that policy was first adopted, on an average less than 70 per cent of the output of the various mills was able to pass the naval inspection. With increased experience has come the ability to do much better work, and Commodore Sicard, president of the Naval Board of Steel Inspection, states that more than 90 per cent of the steel will now pass the most rigid inspection. The capacity of the steel-mills of the country has greatly increased in the mean time, and a still further increase is to be made by the Bethlehem Iron Works, where the erection of the most complete plate rolling-mill in the United States is under way. This mill is to be capable of turning out all kinds of sections and angles, as well as plates of all thicknesses up to six inches. The armor-plate plant erected by the Bethlehem Company is about ready to begin operations. A few experimental plates have been forged already, but none intended for use in the construction of a vessel.

IMPROVEMENT IN SAND-MOLDING PROCESSES. A company is being started in Glasgow, Scotland, for the purpose of manufacturing improved sand-molding machines, as patented and already introduced, on a limited scale, by Mr. Leeder, foreman molder of the Singer Manufacturing Co.'s works at Kilbowie. By the employment of Mr. Leeder's invention a great saving is effected through dispensing with the use of molding-boxes, the maintenance of which is a considerable item in the working expenses of a large foundry. Over 40 of the patented machines are at present in operation in the foundry of the Singer Manufacturing Co., and it has been found on the average that by their means the cost of producing molds for the castings has been reduced to about one-fourth of what had been formerly incurred, and that in an establishment where every appliance of value has been available for the ordinary process of molding.

THE HIRSH ALUMINUM PROCESS, to which this and other technical journals have given wide circulation, seems more latterly to have proven a first-class fraud. It will be remembered that the professor claimed that he could make aluminum from Chicago clay at a cost of 15 cents a pound. The project is now thought to be simply a scheme to secretly purchase the aluminum and make it up for sale in manufactured articles, thus keeping up enough semblance of a genuine business to draw in a host of confiding investors. The popular interest in aluminum is so great at the present time that the field for the perpetration of such a fraud is very inviting.

IN COMPETITION.—There are now two American-built locomotives running on the Tokio-Kioto railroad in Japan in competition with two similar English locomotives, all doing the same class of work on a mountain grade of 132 feet per mile for ten miles of the distance. The American machines are of the Baldwin make; the English from the shops of Naemyth, Wilson & Co. They are running in competition to prove their respective merits. The result of the trial will determine whether England or the United States is to furnish Japan with locomotives in the future, that is, if Japan doesn't construct them for herself. Even in that case, it will be interesting to learn which type will win in the choice of that Oriental people.

BEST MATERIAL FOR LOCOMOTIVE CRANK-PINS.—The *Northwestern Railroader* recently sent out a circular asking for expressions of opinion as to the best material for locomotive crank-pins. Answers were received from 120 members of the Master Mechanics' and Master Car Builders' Associations—being a larger expression of opinion than is ever obtainable at the annual convention of either association. Among those who replied were a majority of the best known heads of mechanical departments in the country. On the subject of locomotive crank-pins, opinion was fairly equally divided between iron and steel, with an advantage in favor of the latter of 44 votes to 34.

BASIC LINING FOR BESSEMER CONVERTERS. The Pottstown Iron Company of Pottstown, Pa., has acquired the patent for the United States for the basic lining for Bessemer converters, invented by Ernest Bertrand of Kladno, Bohemia. The method is somewhat similar to what has been done with acid lining, viz., to grind the material, dolomite or limestone, mix it with water, with or without an adhesive substance, like molasses, and form it into bricks. The latter are burned at a white heat for about 48 hours in a kiln. These burned bricks are again ground and mixed with 10 to 12 per cent of tar, the product being used to ram up in the converter.

LINING CYLINDERS.—Mr. Foster of the Fall Brook Coal Company, has a method of lining cylinders that practically makes a new cylinder for $25. When the cylinder is bored out for the last time, instead of working it in that condition, a cast-iron lining ¾ inch thick is slipped in. The lining strikes the edge of the bore at the back port and thus forms a counterbore. The front end is held by the front head and has the port cut out of it, so that no fastening is required. This makes the diameter of the cylinder 1½ inches smaller than the last boring, and about ¾-inch smaller than the original size.—*National Locomotive Builder.*

ALLOY OF ALUMINUM AND TIN.—M. Bourbouze has compounded a very useful alloy of aluminum and tin, by fusing together 100 parts of the former with 10 parts of the latter. This alloy is paler than aluminum, and has a specific gravity of 2.85, that is, it is a little heavier than the pure metal, but not too heavy to be formed into parts of instruments intended to be very light. The alloy is not as easily attacked by the several reagents as aluminum is, and it can also be worked more readily. Another great advantage is that it can be soldered as easily as bronze, without further preliminary preparations.

CRUSHED STEEL is said to be coming into use for cutting stone. It appears to be made by quenching very high carbon steel in cold water from an excessively high temperature, such as would overheat steel for most purposes. This renders it not only hard but rather brittle, so that it is possible to pulverize it; it is brushed in a stamp-mill and sifted closely to size. It is said to be not only cheaper but much more effective than emery, giving a better polish and quicker, and lasting much longer.

CARE OF BOILERS.—There are many little places about a boiler that escape thorough inspection, even though the more exposed places are well looked after. These will give trouble some day. Boilers, where the top is covered over and the gases return over the top of the boiler, are apt to be neglected here, and in a short while will become well covered with soot. In this way any benefit that may have been derived by the return of the gases is practically lost.

EXPERIMENTS made in Sweden by M. Sandberg on the strength of iron rails during winter have shown that steel rails containing over 4 per cent of carbon are apt to break in cold weather. In fact, the result of his investigations points to the use of rails having less carbon than this—say 3 per cent—in countries as cold in winter as Norway and Sweden.

LONG-DISTANCE POWER.—One of the features of an electrical exhibition at Frankfort, Germany, is to be the transmission of power (500 horse) a distance of 140 miles. It is not pretended that this can be done economically, but the mere doing of it will be one of the wonders of the exhibition.

SCIENTIFIC PROGRESS.

The Philosophy of Quicksands.

Nearly every engineer has, at some period in his working, been puzzled to determine the best way of dealing with quicksands; hence the subject-matter of a paper on such sands, presented by Mr. Wilfrid Airy to the British Institution of Civil Engineers, will likely prove of interest. The author explained that articles great and small, which would be perfectly well able to float in water, are unable to do so in a quicksand, although the sand is of greater specific gravity than water, and are gradually drawn down. Vessels which have been stranded on quicksands by a falling tide have been unable to float off when the tide has again risen, and after being swamped have settled down deeply into the sand; and in the descriptive accounts of such accidents it is often stated that there appeared to be something mysterious in the way the vessels disappeared.

When a vessel or other body floats in water, it floats by virtue of the vertical components of the water pressures around it. If, for instance, the body be a rectangular box floating with its sides vertical, then the box floats solely by reason of the water pressure on its bottom, and if its bottom were protected in any way from the action of the water, the box would not float. This is precisely what happens in the case of a quicksand. The mingled mass of water, silt and sand which constitutes a quicksand forms a semi fluid which is not capable of transmitting the full hydraulic pressure of the water. When, therefore, a vessel comes upon such a quicksand, her bottom is partially protected from the action of the water, and she is unable for a time to float up, even after the water has risen considerably higher than the ordinary flotation level of the vessel. Sooner or later she will float up if she be not swamped.

A quicksand may be defined as a mass consisting chiefly of sand, but partially also of silt or argillaceous matter so intimately mixed with water that it forms a semi-fluid, having all the properties of a fluid, but in a minor degree. The most familiar instance of a quicksand is that of the sand on a beach, where it is kept alive and mixed up with water, soil and organic matter by the action of land springs rising from below it. This often forms a very dangerous quicksand. But the admixture with water may be due to other causes. In general, the tendency of silty sand is to sink together and form a firm, compact body, having apparently none of the properties of a quicksand; but this very sand, when its surface is disturbed by mechanical violence, such as the force of the waves, will, to a certain depth, become a quicksand. The grains of sand become so intimately mixed up with the water that the mingled mass of sand, silt and water becomes a semi-fluid covering the solid body of the sand to a certain depth.

It will be readily seen that the extent to which a mass of sand is capable of becoming a quicksand will depend upon the fineness of the sand and the extent to which it is mixed with silt or argillaceous matter. If the sand be sharp and clean, no matter whether it be coarse or fine, it has very little of the nature of a quicksand; but if it be in a fine state of division and be mixed with silt, etc., the particles will be readily held in suspension by the water, and it may form a deep quicksand. If a vessel be left upon such a quicksand by the falling tide, it will sink considerably into it and the sand will form a very complete and sufficient seal around the bottom; and on the subsequent rise of the tide the vessel will not float when the water has reached the ordinary flotation level, but a considerable time will elapse before the water can communicate sufficient of its pressure through the seal of sand to float the vessel, and in the mean time the water will have risen considerably higher than the ordinary flotation level of the vessel.

In order to verify the conclusions, and to obtain some reliable measurement of the effect of such quicksands, Mr. Airy made many experiments with different kinds of sand, both fine and coarse, with the general result that clean and sharp sands had few of the properties of quicksand. But the case was different with sands which, although apparently clean, contained an admixture of clayey matter. The experiments all show that there exists in fine sand, with a slight admixture of clayey matter, a capacity for becoming "quick" and holding vessels to a degree which, in combination with other causes, may act powerfully in bringing about some of the terrible and unexplained shipwrecks that so frequently occur on sand-banks. If in any case it should be thought advisable to make provision for freeing ships from sand-banks which they might be liable to run upon, the plan to be pursued is tolerably clear. All that is wanted is to assist the external water in breaking through the seal of the sand round the bottom, and re-establishing the full hydraulic pressure. This could be done by forcing water with pumps through holes in the ship's bottom, and would probably soon have the desired effect.

THE ENGLISH LANGUAGE FAST BECOMING UNIVERSAL.—*Kuhlow's German Trade Review*, a leading German periodical, but which is largely read by business and literary men throughout the world, and which is published at Berlin, the capital of the German Empire, is printed in English. A late number of that journal, after referring to the great number of persons who speak various languages in Europe, sums up by saying: "The English language is now used by nearly twice as many people as any of the others, and this relative growth is almost sure to continue. This is the reason of *Kuhlow's* appearing in the language of the trans-Atlantic world—English." Forty or fifty years ago we heard it prophesied that the universal language of the world would eventually be the Anglo-Saxon, and we now believe it more firmly than ever.

Loss of Heat in Chimneys.

There are many common errors as to the chimney temperature, one of which is that a high temperature therein argues a considerable loss of heat from the furnaces, but this does not by any means necessarily follow, for if the combustion of the fires is imperfect a large proportion of the gases pass away unconsumed, with the effect of lowering the funnel temperature; but on the other hand, when the gases become thoroughly consumed, a much larger amount of heat is generated, and though the chimney temperature may be higher, yet a very much larger relative proportion of heat gets into the boiler to perform useful work. The temperature in a furnace in which incomplete combustion is taking place—that is, in which a proportion of the gases passes away in the form of carbonic oxide—may be, say 2000° F., and the chimney temperature 500°. If the combustion is then completed, and the carbonic oxide instead of escaping becomes converted into carbonic acid, the furnace temperature may rise to 3000° F., and that of the chimney to 800° F.

Chimney Gases.

The Research Committee on marine engine trials have recently issued tables giving an analysis of chimney gases, which show them to consist (approximately) of

Carbonic acid	10
Oxygen	10
Nitrogen	80
Total	100

While their temperature varied from 500° F. to 800° F.; and as the whole of this heat passed away through the chimney, it was entirely lost. An American writer has remarked: "The time is approaching when tall chimneys will serve no more useful purpose than that of monumeots to the folly of their builders."—*Chicago Journal of Com.*

FLAMELESS COMBUSTION.—In [illegible] on "Flameless Combustion," Mr. T. Fletcher said: The appearance of flame is misleading, and the greater the flame the smaller the work done, other things being equal. I have been asked by a well-known engineer if I could explain why certain boilers gave such exceedingly small duty for the fuel consumed, when the flues were, as he said, "filled from end to end with magnificent flame." The fact was that his so-called magnificent flame was a delusion, hollow and cold inside, and not coming in contact with his boiler at all. When the same fuel was burned with a very small flame, hardly visible over the bridge, the duty increased some 30 per cent.

HEATING AND COOLING BY THE SAME FURNACE.—"The time is coming, and it is near at hand," says the Commissioner of Patents, "when our homes will be made cool by the very same furnaces which warm us in winter. As a matter of fact, there are plans and specifications already in this office which scientists have been engaged upon for some time past and have nearly perfected, that make it possible for every one who can afford to own a furnace to make, if he chooses, his house as cool as an ice vault. When this invention is thoroughly perfect, heated terms will have no terrors for those who have the means to use it."

THE REASON WHY the electric light is not as efficient in piercing fog as the yellow gas or oil light is that fog is blue, by reason of which the electric light intensifies rather than pierces it. To remedy this, experiments which promise the fullest success are now being made to introduce hydrocarbon vapor into the arc, which changes the white color of the arc to one of more or less deep yellow, according to the quantity of hydrocarbon consumed.

MAGNETIC QUALITY OF THE ELECTRIC LIGHT. An attempt has lately been made in the United States Navy to light the binnacles of ships by electricity instead of oil; but it was found that by bringing an incandescent lamp close to the compass a deflection of the needles could be produced.

TWO NEW ASTEROIDS.—Director Holden of the Lick Observatory informs the San Jose *Herald* of the discovery at the observatories at Nice, by Astronomer Charlois, of two asteroids on the 9th inst. They are respectively of the 12th and 13th magnitudes.

A PRETTY EXPERIMENT —If you have a chain made of alternate links of platinum and silver, and pass a strong electric current through it, the platinum links become red hot while the silver remains comparatively cool.

THE APPLICATION OF ELECTRICITY to all sorts of extensive enterprises reveals its readiness of operation, as well as its capability for usefulness in a superlative degree in almost every department of industry.

Useful Information.

Railway Employes in the United States and in England.

There have been many and varying estimates as to the number of persons employed in the railway service in the United States, and some of them have been very wide of the mark; Poor's Manual, for instance, in 1889 estimating the number at more than 936,000, or an average of six persons per mile. The census of 1880 made the average 4 8 men to the mile, and from an examination of the various State railroad reports and numerous company reports the *Railway Age* some years later came to the conclusion that the railway employes in this country average in number about five to the mile, an estimate which is pretty well supported by a table by the statistician of the Interstate Commerce Commission, just published, showing the number of employes by classes. From this it appears that the average at the date of report, June 30, 1889, was 4.59 per mile of road, and that the number of workers aggregated 704,743. To this estimate it is added that "the railway industry of the United States provides a living for 3,000,000 persons, or about one in 22 of the total population of the country," this of course not including railway stockholders, who in many cases obtain their support largely from the earnings of the roads.

The document quoted from proceeds to compare the number of employes on American and on English railways, showing a very much greater number of men to the mile on English roads than on ours; a fact which seems to furnish some presumptive evidence of the superior efficiency of American railway men, although the vastly greater traffic to the mile on English roads than on our own must be considered in making a just estimate. English railways in 1888 employed 346,426 men on 19,820 miles of railway, or 1748 men per 100 miles of lines; that is, nearly four times as many to the mile as on our roads. The fact that while with eight times as many miles of main line our railways employ only 2½ times as many engine-drivers as those of Great Britain is of itself an indication that the traffic of English lines is so much greater per mile than that of ours as to prevent satisfactory comparison from the data here given. The very rapid construction of railways in thinly settled portions of this country has reduced the average number of men employed per mile, but the tendency is constantly toward an increase of the average working force as a result of the increase of traffic on new and old lines also, so that at the present time five men per mile of road is probably not far from a correct basis for estimate; and as the railway mileage of the United States is fully 164,000 miles, we may say that in round numbers the railway employes of the United States now aggregate about 800,000 persons.

Cutting Glass Bottles.—A correspondent of the *Scientific American* gives the following as the method by which glass bottles may be cut off smooth and square: "Fasten the bottom of the bottle to a chuck on a wood lathe with melted resin, and then revolve the lathe at a high rate of speed. It can be cut as true as a straight edge by holding a piece of thin, soft iron wire on the spot where it is desired to cut it off, keeping it there till the wire gets red hot, then project a little water on the hottest part of the wire, when the neck will fly off. This is the best way it can be done, and is the way French ware is cut off in glass factories, only the chuck is hollow. If the bottle to be cut is thicker in one place than another, the cut may not be quite as true." Another correspondent gives a method which might be used when a lathe is not at hand. "Cut carefully clear around with an ordinary glass cutter, then place the bottle on a microscope turntable, or on any apparatus that would allow it to turn steadily and smoothly (suspending by a cord from ceiling might do), then revolving it at a speed of from 50 to 75 revolutions per minute, and directing the flame of a blowpipe on the mark made by the glass cutter; in a half to two minutes the bottle will crack the greater part of the way round, when the blowpipe can be removed, and by gentle traction upon the two parts, they will separate very readily; if not, a wet string laid on the mark will usually complete the operation. The main thing is to heat the glass evenly clear round."

The Big Lens.—A dispatch from Cambridge, Mass., dated Sept. 18th, says: Yesterday the glass for the University of Southern California telescope was unpacked by Alvin G. Clark. Among those present were Judge R. M. Widney, president of the University Bank of Los Angeles and a trustee of the University of Southern California, George Clark and Robert Widney. When the lid of the big box was removed, Clark tenderly lifted away the excelsior fiber which covered the precious lens. The glass measures about 10 feet in circumference, or 4 feet 4 inches in diameter. Although it is 2½ inches thick at the center and 1½ inches at the edge, it was as transparent as a bit of thin plate glass. Clark's hands fondled it as he would a baby while he murmured: "What a beauty it is. No one ever saw its like before." It is nearly five inches wider in diameter than the Lick telescope glass. Clark says that its curve on one side is almost perfect, as he ascertained by the aid of a spheroid, but that the other will stand a great deal of cutting down. He has not yet decided whether he will have the work done at his manufactory in Cambridgeport or put up a new plant to complete it near the scene of its future home in California.

A Smoke-Consuming Apparatus has been adopted by the corporation of Leeds, in connection with two boilers for the public refuse destructors. The chief feature of this new apparatus is that the furnace is so constructed as to burn in a downward direction. Ordinary fire-bars are not used. By a descending draught the smoke, thoroughly saturated with oxygen, is passed through the mass of incandescent flame, the hydrocarbon gas being thereby burnt and destroyed, and the flame converted into carbonic acid gas before it enters the flue.

Good Health.

Health of the State.

By the report of the State Board of Health for August it appears that reports were received from 96 localities with an estimated population of 808,360, among which were 1065 deaths, an annual average of 15 84 per thousand, somewhat less than the report for the preceding month.

Among the principal causes of death, the greatest number, 157, were from consumption, an increase from last report.

Cholera Infantum is reported to have been the cause of 76 deaths; this large percentage has been due to the average high temperature during the month.

Heart disease appears to be increasing; 63 deaths are attributed to this cause.

Pneumonia has claimed 41 deaths; a decrease of 10 since last month.

Bronchitis is credited with 29 deaths, 20 of which were in this city, over two-thirds of the whole number, although its population is but a small fraction short of one-third of the whole population reported upon.

A Fatal Neglect.

Under the head of diphtheria, a circumstance is recorded to which general attention should be called as a warning against similar neglect in the future, and as an evidence of the manner in which that dreadful scourge (diphtheria) is sometimes induced. We copy as follows from the report: From the latter city (Alameda) Dr. J. T. McLean reports 18 cases of diphtheria, nearly all of whom were attending one of the public schools. He says: "An old cement sewer laid 12 years ago in the block on which this public school is situated, wore out and caved in, thus stopping the flow of sewage from the residences and school in this block. The old sewer was taken up and replaced by a new ironstone one. The process of change from the old to the new sewer occupied a fortnight. During this time, sewer gas and disease germs escaped and contaminated the atmosphere in the neighborhood. The school children were more or less exposed, especially those whose curiosity drew them frequently and for a length of time to the vicinity of the sewer. The disease developed in these children, and it is believed this broken sewer, with its escaping gas and disease germs, was the exciting cause of this sickness. In one family, where three children had diphtheria, one of them dying, the plumbing and sewage were defective, the filth that should go into the sewer escaping into the cellar and contaminating the atmosphere of the house, from which the sickness and death in this family resulted. Other cases of the disease are of a mild type."

Milk Instead of Medicine.—Leading physicians are becoming holder. Many have courage now to prescribe a certain diet instead of drugs. Is not the food an important factor in determining the character of our future lives? The infant whose mother drinks alcoholic stimulants while nursing it, will, three chances out of five, be addicted to the use of such stimulants when grown. A weary business man comes home from his office at night nervous and out of temper. A glass of milk heated to about 90 degrees, sipped a little at a time, and no food taken with it, or at most only a little bread and butter, will do more toward restoring him to a happy mind and good physical condition than all the tempting viands that can be placed before him. A lady in Platte county, Mo., was pronounced incurable. A well-known physician in Kansas City advised her to give up all medicine, and, in order to prolong her life, prescribed three ounces a day of a mixture of sweet cream and sponge cake. Inside of four months she was well.—*Ex.*

Remedy for Cholera.—It is said that a remedy for cholera has been discovered by a Frenchman from Cette. People either attacked by or in fear of the disease must sit for some hours in a garment soaked in paraffine, which irritates the skin, producing a healthy reaction, and kills the cholera microbe. How can such a remedy act upon the cholera microbe securely ensconced within the most interior portion of the human system?

Deafness.—We find the following in one of our exchanges: Just now the medical world is engaged in discussing the new device for deafness called sound disc. No invention of late has attracted so much interest among the medical profession. Its perfection, which is now an established fact, has resulted in the overthrow of many pet theories of there being no relief for a vast number of cases of deafness. This ingenious discovery was made by H. A. Wales of Bridgeport, Conn., and coming as it does with the approval of some of the leading aurists of the world, it can hardly fail to prove of great value to the profession and the afflicted.

Engineering Notes.

Flooding the Sahara.

From time to time hints have been given out as to the feasibility of flooding the great Desert of Sahara, which some maintain is considerably below the level of the Mediterranean sea. If this is a fact, it appears at the first glance to be comparatively easy. In the thousands of miles of sea-bound coast, one would think a spot of low level could be found to admit the water on a large scale, which in time might overcome evaporation, and rising above and covering the sandy desolation, change the desert aspect to a clime of health and beauty on the higher lands. There are many considerations which should be taken into account before such a great engineering feat is undertaken. First, what amount of evaporation would be carried on over such a vast area of the earth's surface? What would be the result of such a great weight brought to bear on a fresh locality? Would it have any appreciable effects on the earth's rotation? Would the cooling which might be occasioned lead to any serious agitation in the air? Are the lower levels of the desert inhabited to any great extent? What are the respective levels of the Red and the Mediterranean seas and the Atlantic ocean?

The area of the desert is about 2000 miles in longitude by 1000 in latitude. The proposed connecting canal or route of inflow from the Mediterranean is about half-way of the distance of the desert in its longitudinal direction.

Another Scheme.

Somewhat in conflict with the above scheme is another for opening up for commercial enterprise the borders of this arid region by a continental railroad some 2000 miles in length. Recent information says that a Commission of Inquiry investigating the trans-Saharian railway schemes has approved the route from Constantine and Biskara in Algeria across the desert to Lake Tchad. This route is by way of Tlemsen and Amesoltah and traverses the Tuarick country. The length is 2000 miles. This project is backed by the Banque de Russe et Francaise.

Stanley on the Sahara.

In connection with the above, the opinion of Mr. Stanley in regard to the character of this desert may be found interesting. An interview with this noted traveler is given as follows:

Mr. Stanley thinks Lord Salisbury underrates the light land in Sahara. I asked whether an engineer would not be roasted to death in driving an engine through that desert.

"No," replied Stanley, "not if he were used to the climate."

Mr. Stanley thinks the Sahara valuable just on account of the sand.

"It is awful business," he remarked, "to lay down rails in any tropical country where vegetation is rank. Every sleeper in the Aspinwall & Panama railway cost a navvy's life. The fever caused by the exhalations of the rotting vegetation under the hot sun is mortal, but in the Sahara there is nothing of that."

Canal Projects in France.—The project for making Paris into a port is now completed, and nothing remains but the sanction of the Government to put the work into the hands of the contractors. Hitherto the Government has kept aloof from the proposals until its promoters were in a position to carry out the undertaking to a successful issue, a caution engendered by the recent failures of French engineering undertakings. The promoters have now raised the necessary capital, amounting to £5,400,000, and it is probable that the sanction of the Government will be given to the project, and the work of canalizing the Seine with a view to allowing the passage of sea-going vessels from Havre to Paris will be proceeded with, and extensive docks will be constructed at Pantin, on the northeast of the city. Another proposal is for the construction of a canal to connect the Mediterranean with the Bay of Biscay, with the intention of intercepting a great part of the shipping which at present passes through the Straits of Gibralter. If these two projects be carried out, they will have an immense effect on the trade of France.

Recent Advices all indicate that work on the Nicaragua canal is to be prosecuted from now on with great activity. The construction company has just purchased a large outfit at Colon, consisting of seven dredges, 15 lighters, and a quantity of tools, machinery and supplies. The surveys of the western section of the canal are nearly all finished, and our Government, which is in sympathy with this great enterprise, has sent the Kearsarge to Colon to afford any protection that may be needed, and present appearances are all favorable for the uninterrupted continuance of the work. The completion of this canal will have a very decided effect upon the lumber trade of the Pacific Slope.

Electricity.

Electricity in War.—The possibilities of the use of electricity in warfare at present are only limited by the amount of machinery that can be handled. Those who are continually urging the Government to build vessels of war with a view of destroying life and wasting the public money, should be trotted out into some wilderness and given an opportunity to practice on each other with lightning as their weapon, for the benefit of those who know that it is time that war should cease altogether, and those who are picnicking on Government vessels at great expense in the Mediterranean should be called home and instructed in the art of earning their own living. Why should we fight when national boundaries are becoming less defined and all peoples are drawing together as one people? Why should we kill each other? A late invention is the attachment of an electric motor to a Gatling gun, increasing its capacity from 500 to 1000 shots per minute. This, says a contemporary, is looked upon as a wonderful increase in destructive power, but it must not be lost sight of that electricity is lightning and that in handling it we are in our infancy. Fortunately it is a law of nature that those who are given the knowledge of its occult forces are at the same time disarmed of the desire to use them, and the desire for money-making decreases in the same ratio.

The Generation of Electricity by the Flow of the Tide.—A French engineer, M. Decœur, has elaborated a project by which he proposes to supply electric-power to Paris. He would generate the required electricity by utilizing the flow of the ebb and flood on the coast and transmitting it to the French capital. For this purpose he intends to construct, near Havre, two large basins joined to each other, into one of which the sea at flood-tide flows over a dam, while during ebb it flows out of the other into the sea again. At the inlet and outlet M. Decœur proposes to erect a number of powerful turbines, for tranamitting the energy of the water. The mechanical energy thus produced M. Decœur estimates, with a tide of 18 feet, which is the average at Havre, a 6 horse power per hectare of basin area. He intends parting off, by means of a dam 16½ miles long, an area of 7000 hectares between Havre and Tancarville from the sea and the Seine respectively, and thus creating 42,000-horse power, which power he transforms into electrical energy and transmits to Paris. M. Decœur's scheme is looked upon with favor, and although the estimated net profit of eight and one-half million francs is too high, there are indications that it will ultimately be carried out.

Improved Means of Electrical Transmission.—An electrician has just patented a device whereby it is claimed that large quantities of power can be transmitted long distances by means of alternating currents. By the use of this, water-power can be utilized at long distances. The potential of the current is made very high in the wires, thereby reducing the cost of wire to minimum. He has also patented a sort of electrical tow-horse for street railways. It is often necessary at curves or on grades to exert large quantities of power for a moment in starting or moving cars. When a car is quite a distance from a station or on a grade, it takes a tremendous current to move it. This momentarily creates a great drop in potential. To meet this emergency the professor places storage batteries at different points along the line. These batteries are made to be capable of quick discharging and are of rather limited capacity, the object being merely to supply a large volume of current for a few moments in the starting of the car. After using, they are immediately recharged again by the current.

Spectacular Electricity.—The New York *Sun* tells of an electrician of that city who has made a specialty of spectacular electricity, who says that the day is not far off when electrical fireworks will supersede those now used. He declares that for a comparatively moderate outlay he could arrange an electrical display for the city which would last for many years, and could be repeated as often as desired. It would comprise rockets, Roman candles, wheels, Niagara Falls, and all the modern pyrotechnic effects.

Copper.—"Never was the copper outlook better than at the present time," said one of the largest dealers in the country to a Butte *Inter Mountain* scribe. "The price remains stable, and that at figures that cannot but be satisfactory to the producer. I see that copper is quoted at 16 40 this morning, but I also notice that all who buy are obliged to pay 17 flat, and the holders are not anxious to sell at that. Large as is the supply, the demand is still greater and has become established as such. This makes the market certain within all reasonable bounds and fixes the price for the future. Of course there will be fluctuations, as everything is uncertain, but it would be difficult to construct any combinations of circumstances that would be more favorable to the red metal. Of course there may be breakers ahead—one can't always tell; but so far as can be seen now there is nothing before us but clear sailing."

The shipments of quicksilver from Calistoga in August amounted to 540 flasks.

Passing Events.

The starting up of the works of the Tacoma Smelting and Refining Co. last week is quite a notable event for the mining interests of the Northwest. There is still room for many more enterprises of a similar character on this coast.

In the death of Governor Stevenson, Nevada loses one of her most prominent men, and one who has been identified with the mining and milling interests of the State for many years.

The resumption of pumping the water ont of the Gold Hill mines last week means the reclamation of territory for prospecting purposes fully as extensive as that now possessed by the mines. Mr. Dow of this city, whose system has been adopted, is sanguine of success.

It is announced that a new coal-field in Mendocino county is to be opened by capitalists. The beds are not very far from the coast at Fort Bragg, and shafts are being sunk to test the deposits thoroughly.

THE DODGE PULVERIZER.—Among other places, the Dodge pulverizer has been put in operation on gold ore at Juneau, Alaska. Archibald Campbell of that place writes to Mr. Dodge as follows: "I am having no trouble with your pulverizer. It is the best machine I know of for free-milling rock."

SOME portions of the State were visited by rains on Wednesday of this week.

Professional Dummy-Directors.

The publicity given to the mismanagement of the Hale and Norcross mine has brought to the front a discussion of the proxy system of voting stock so as to carry mining-share elections. It is this, as now carried on, that allows the more unscrupulous, if so disposed, to elect dummy-directors who in their turn will do the bidding of those to whom they are indebted for their positions of trust. Stock-brokers, mining secretaries and others in whose name stock stands as trustees for real owners give their proxies for the shares, knowing that the act is, to call it mildly, illegal.

In the full knowlege of the recent undenied public charges against the management of the Hale and Norcross mine, there can be no doubt but the genius of the Comstock lode displayed his master hand when he brought forth the dummy-director.

He is not a myth. His large salary drawn by assessments from stockholders renders him conspicuous, if not relatively dear. No matter what disguise he may assume, the professional dummy-director, held in position by the hidden hands of those whom public opinion charges with looting the mines, always shines through it, and the poor stockholder foots the bills for the masquerade.

M. W. Fox, chairman of the Executive Committee of the Mining Stock Association, related his experience to a representative of the MINING AND SCIENTIFIC PRESS, which will serve as an object-lesson to our readers.

Said Mr. Fox: "Last July, when the report reached us that ore had been struck in the Potosi winze below the 930 foot level, I being a large stockholder, applied at the company's office in this city for a permit to examine the mine. The company's president informed me that a permit was not necessary; that he would write the acting superintendent, Mr. Pendergast, and that I would be admitted to the mine upon my arrival in Virginia City. Believing this statement to be sufficient, I left for the Comstock that afternoon. The day following my arrival at Virginia City, I presented myself at the mine, inquired for Mr. Pendergast, and upon his appearing I made known to him the object of my visit—to examine the mine. Mr. Pendergast informed me that he could not permit any one to enter the mine without a written order from one of the Joneses, Mr. Hayward, Mr. Hobart or Mr. Hamilton, the superintendent. I then asked him if the president of the mine had not written to him giving direction or orders to have me admitted to the mine. In reply, Mr. Pendergast said that the president had not yet written to him, and added that even had he done so it would do no good, because he had no authority to give such an order.

"Now what do you think of the position occupied by this president? The bona-fide stockholders pay this man more than $1000 a month to hold a position of trust for them in various mines of the Comstock.

"This president, acting as a trustee for me, and representing my stock as well as the stock of thousands of other stockholders, let me go to Virginia City at a loss of time and money to myself when a word from him would have been sufficient to show me that he had not the power to admit me to the mine and that my application should have been made elsewhere."

THE PATENT OFFICE.—The report of Commissioner Mitchell of the Bureau of Patents for the fiscal year ended June 30th, shows that 46,140 applications and caveats were received, as against 42,047 for the previous year. The receipts of the office for the year were $1,547,203; expenditures, $1,081,175; surplus, $266,030, as against a surplus of $186,359 for last year. The balance in the Treasury on account of the patent fund is $3,790,556. During the last year the office disposed of 4596 cases in excess of the number disposed of during the previous year.

FISH DISCOVERIES.—During her late cruises the Albatross discovered 27 new species of fishes on the coast of California. All of them are from a greater depth than 100 fathoms, and most of them are small, so that no additions to the food fishes have been made. These, with the 26 new species discovered by Dr. and Mrs. Eigermann in California shallow waters, and the one described by Dr. Brown, considerably increase the number of species from this State.

Modern Marine Boilers.

Pacific Mail Steamship Co.'s Steamer "City of Sydney."

In these days of keen competition among producers of marine machinery, it is absolutely necessary to be in possession of the most modern appliances, not only for reducing to the lowest point the cost of production, but also to insure work of the highest class. Even here the manufacturer must not rest; he has to exercise his talents in order to get ahead or at least to keep pace with the rapid strides made during the present year in marine engines and boilers. With regard to the former, we admit that the progress made in its development is more marked than in the latter.

Since the introduction of triple and quadruple expansion engines, with pressures of 150 to 180 pounds per square inch, a complete revolution in the matter of boiler construction has taken place. The thick plates now in use, consequent from the increased pressures, have necessitated the employment of machinery in constructing a modern marine boiler to a much larger extent than has been the case hitherto. We find that it is absolutely a necessity that hydraulic riveting should be adopted wherever practicable, that all holes should be drilled instead of punched, and again the flanging of plates done by machine, instead of by hand, and the use of steel plates throughout in place of iron. This, then, is the actual outcome of modern marine engine improvements, and, although many steamship owners have not yet adopted the modern system of triple engines when boiler renewals are required, still they naturally expect to have their boilers constructed even for the lower pressures on the most approved plan, insuring to them workmanship of the very best description.

Such is the case with the Pacific Mail Steamship Co. when placing the order for the renewal of the boilers of their steamer, City of Sydney, together with a complete overhaul of the ship and machinery, in the hands of the Risdon Iron and Locomotive Works of this city. The ability of this firm to cope with work of this description is too well known on the Pacific Coast to need any comment from us. The accompanying illustration furnishes our readers with a fair idea of the magnitude of the work, which now stands completed in the shop of the Risdon Iron Works, ready for shipment on board as soon as the repairs to the hull are complete.

It will be seen that the boilers are six in number, placed three on each side of the vessel, and fired athwartship; with the exception of tubes and braces, they are constructed throughout of mild steel. Each boiler is 13 feet mean diameter and 10 feet 6 inches long, and is fitted with 3 corrugated furnaces 36½ inches minimum external diameter, 7′ 6″ long, having separate fire-box to each furnace. The number of tubes in each boiler is 204, and are 3¼ diameter; 32 of these are fitted as stay tubes. The furnace fronts are flanged outward to receive the furnaces, this system affording the ability of hydraulic riveting. The back head is also flanged ontward for attachment to shell plates for the same reason; all the rivet-holes throughout have been drilled in place; the circular and longitudinal seams are double riveted, the latter fitted with butt straps inside and out, all of which are riveted up with hydraulic pressure. The collective heating surface of the six boilers amounts to 9612 square feet, and a total grate area of 324 square feet.

Considerable attention has been given in designing the boilers to provide ample means for cleaning and the thorough internal examination, a point which is too often overlooked. They have been constructed to conform with United States laws for a working pressure of 80 pounds, and have been tested by hydrostatic pressure to 120 pounds, and found to be perfectly stanch and water-tight. Each boiler is fitted with a main stop, spring loaded safety, separate main and donkey feed, scum and blow-off valves. The main feed is delivered into the boilers through Matthews' patent feed-heating apparatus, a system which has proven highly successful not only in prolonging the life of the boiler but also in the economy of fuel. The steam generated in the boilers passes into a superheater 12 feet diameter and 15 feet long, having an internal flue 7 feet 4 inches diameter. The superheater is also fitted with stop and safety valves, so that connection from all the boilers with main engines may be severed by the closing of the one stop valve. The work throughout during construction, and also the repairs to hull and machinery, have been conducted under the supervision of Mr. J. Matthews, the Pacific Mail Co.'s marine superintendent. The progress the Risdon Iron Works have made with the work justifies us in saying that they will be enabled to place the steamer again on her station early in November.

Timber and Mines.

Senator Sanders, during the consideration of the House bill to repeal the timber-culture laws, offered an amendment providing that in the gold and silver mining regions of the State of Nevada and those States and Territories in which there are public lands containing timber, and where there is no United States law authorizing the sale of such timber lands, residents of such States or Territories, if prosecuted for cutting timber, may plead that it was cut for agricultural or mining purposes. After some modification this was agreed to.

It is to be hoped that some such step as this will be taken and become the law. The miners need the timber to carry on their work, for, with them, it is absolutely indispensable. A year or two ago, a lot of men were arrested for cutting timber on public lands, when they were using said timber in developing the mineral resources of the region, and the timber was of no use for anything else.

There are plenty of persons deserving prosecution for wasteful cutting of timber without going after those miners who only cut the timber they need in their business. Quartz mines cannot be developed without the use of timber, and plenty of it, and the law should be plain in permitting its use for that purpose.

Congress and Railroad Lands.

Senator Plumb has reported favorably from the Public Lands Committee the bill declaring that railroad land grants shall not be held to include land containing valuable deposits of gold, silver, lead, iron or other metal, unless the same is specified in the grant.

Some definite action like this by Congress, if taken a long time since, would have saved much trouble and litigation and been of the greatest advantage to the mining interests of the Rocky mountain and Pacific Coast sections. The cloud thrown on the title of many mining properties by the claims of the railroad companies has kept down the valuation of said properties and prevented the owners from selling or working advantageously. The recent rulings and decisions, however, have pretty well cleared away these clouds on titles. Still, an official expression by Congress on the subject will be of great advantage and set the question finally at rest. It was never the intention of Congress to let the railroad companies have the mineral, and only technical grounds were used to base the claims of the companies.

Reopening Old Mines.

The last monthly cleanup of the Wildman, in Amador county, was one of the best ever made at that prosperous mine. Rumor has it that the yield amounted to over $20,000, or $1000 to the stamp.

And yet this mine has been lying abandoned for 20 years until a short time since when it was reopened and reworked. Now it shows a yield of $20,000 in gold for one month's work.

There are a good many more of these abandoned mines in this State, which would pay equally well in proportion, should money be put into them for development and machinery. The trouble is that the owners of such claims have not the coin to pump them out and start up. The conditions under which we mined 20 years ago were materially different from what they now are. Transportation, supplies, etc., are cheaper, we know how to mine and mill better, labor costs less, and mines that would not pay then can be made profitable now. Under such circumstances it is a wonder that no more of the old mines are reopened.

H. A. TRUE of the smelting works of El Paso, Texas, is in Colton with a view of establishing reduction works if a sufficient quantity of smelting ore can be found in the mines near there.

of smelting ore can be found in the mines near there.

The Gold Belt of California.

Ancient River Channels and Gravel Deposits.

NUMBER II.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON of Kernville, Cal.]

While the flora of these old deposits speak unmistakably of the climate, we must look to the fauna for the true index to their age. I have known of no mammal fossils of present species coming from these ancient gravel deposits except the "Mioosns Skull," to which Prof. Whitney has aided to draw attention. And I may here observe that there is no more reason for believing that that relic of our ancestors was any more of the species of the man of to-day than there is for believing that the fossil, three-toed horse was of the same species of the pure Arabian of to-day. I have seen an incisor tooth—evidently from a ruminant—from these ancient gravel deposits, which was nearly three inches across its face. I have also seen a conch shell five inches in diameter, and highly petrified. As to the mastodon, I believe his advent was altogether subsequent. The firm of Smith & Rider, once engaged in the lumber business at Columbia, had several femurs, and I think three under jaws of these fossil animals, and other bones in proportion. A hotel-keeper at Kinoaid's Flat, in Tuolumne county, had a portion of a tusk, some seven inches in diameter and four or five feet long, holding its size throughout, and many other bones found about the same time, prior to 1858. The bones held by Smith & Rider were found at Gold Springs, on the bluff of the Stanislaus river, where the cutting down of this channel has formed a drainage of the mountain limestone which forms the bedrock beneath the ancient gravel deposit at Columbia. The springs are therefore very much more modern than the ancient gravel; and yet these bones were very much more modern than the springs, notwithstanding that these springs, at their present rate of depositing calcareous matter, must have been, at my estimate, 22,000 years in depositing the calcareous tufa with which the bones (and the whole mountain-side) were covered. At this point the Stanislaus has cut down 1300 feet below the bed of the ancient channel, and by examining almost any of these old channels, we shall find where the miner has unearthed an abundance of evidence of the gradual decadence of the stream. All streams carry their curves farther down as they deepen, by the simple act of impinging upon and undermining the outer bank. Hence the miner has found that he may look for a series of river bars on the point projecting into the inside of the curve.

We find these bars at all altitudes from the top of the bluff to the present bed of the stream. Of course they do not all occur on one point. There will be a series of bars of the same altitude, or rather on the same grade, ranging from point to point. At another place there will be another series at a different altitude and on a corresponding grade. In studying these evidences of gradual change, the first impulse is for the mind to become bewildered at the vastness of time necessary to enable a river to make such havoc with hard granite. Then again we console ourselves with the question, if the earth was not always here, where did it come from? I have seen (in the Tuolumne grove) Sequoia trees six or seven thousand years old standing on the cement which caps one of these old channels, and yet there was absolutely no evidence of cutting down of the bed of the gulch since these trees took root. On the South Fork of the American river is a good place to study this gradual subsiding of the stream; and yet, take gold from any of these bars within the canyon, and the banker will tell you at once that it is South Fork gold, though it only requires an amateur to tell the gold of different streams. The gulches putting into the South Fork from the south all have gold of the same type, for the reason that they all draw their gold from the Emigrant ridge, jutting down toward Placerville, and which the old Carson road followed for many miles. The amount of hidden wealth beneath this ridge is for future generations to determine.

I had no intention of implying, however, that the character of gold does not change at long intervals up or down the stream. I have hoped some day to see a correct diagram of assays, and expected to deduce from it some proof as to the point from which the gold originally came. If we draw a line across all the channels, starting, say, from White Rock in El Dorado county, and running to the east of south through Smith Flat and Indian Diggings in the same county, thence through Volcano in Amador county, Murphys in Calaveras county, and thence to Columbia and Sonora in Tuolumne county, we shall be able to discover two important facts, if not more. First, we are on a line of high assays, where the average assay of the gold dust taken out is above .930. Parallel with this line, five miles away, we shall find, on either side, the average assay falling below .850. Second, we shall find that this line of high assays traverses the central trend of the great lime belt of the "southern mines." We shall also find that we are above and farther east than the mother lode, so called, and that on this line lies the cream of the California placers.

Perhaps above this line the fine gold may still remain buried in the deep channels which underlie the lava-capped ridges, while lower down it may be alloyed by gold from the quartz ledges of the foothills.

(To be Continued.)

The Gates Ore and Rock Breaker.

The ordinary impression that almost anything will do for a crusher is a great mistake, as many have found to their annoyance and cost.

The fact is that the crusher is the most important piece of machinery connected with any mill. When this gives out, all work stops. Then it is conceded that such reduction as can be made with a crusher is done with less expense than with stamps or any other form of mill. The extent to which the Gates crusher is coming into use for quartz work, stamps it as a machine of unusual merit.

One of the important features claimed for this is its capacity for fine work. The limit in ordinary jaw-crushers in this direction, as is well known, is in cubes that will pass a 2½ or 3" ring. With the Gates, everything can be reduced down to 3 8 or ¼", with say 1-3 of the product fine enough to pass through a 15 or 20 mesh screen.

By this means the rougher part of the work, that ordinarily falls to the stamp or rolls, is done by the crusher, greatly facilitating the process of reduction, while the wear of the more expensive machinery is much reduced. Mills that are using this machine claim an increased output of at least 25 to 30 per cent. It will readily be seen what an advantage this alone affords in any milling enterprise. Among other claims made for this machine is that of great saving and cost of wearing parts, in other words, records of working show an average of 12,000 or 15,000 tons with one set of wearing surfaces, and sometimes greatly exceeding this, to less than 1 3 of the above-named amount for ordinary jaw-crushers. A considerable saving in power is also claimed. These are considerations which have already attracted much attention among mining men who are looking to economical results.

The well-known Homestake Mining Co. in the Black Hills, Dakota, purchased some six months ago a Gates crusher for purposes of test and comparison, with the result that they have recently thrown out their Blake crushers —16 in number—and substituted the Gates therefor.

When a machine that has always ranked as the best is thus discarded after a thorough and exhaustive test made with reference to determining which afforded the most advantages, the experiment ought certainly to be of value to users of such machines.

The old plea of "let well enough alone" will not do in these days of progress. While the element of competition does not enter into mining as in other departments of business, yet improved machinery tends, by reducing cost, to enlarge the field of operations as well as to enhance profits.

Most experienced and even conservative mining men are not slow in adopting appliances that show such advantages in practical working.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

BELLEVIEW M. & AGRICULTURAL CO., Sept. 19. Location, Tuolumne Co. Capital stock, $1,000,000. Directors—John W. Coleman, A. P. Hotaling, Thomas Bell, John W. Maxwell and George Staacke.

SOUTHPORT LAND AND COMMERCIAL CO., Sept. 19. Capital stock, $500,000. Directors—A. W. Rose, Jr., W. E. Sell, R. E. Wilson, H. A. Parrish and J. T. Peck.

LEACH LUMBER CO., Sept. 20. Capital stock, $500,000. Directors—A. M. Leach, Margaret I. Leach, J. Levi, Sr., J. Levi, Jr., and O. H. Greenwald.

PACIFIC CONSTRUCTION CO., Sept. 22. Object, to construct, manufacture, mine and transact commercial business generally and operate railroads, telegraph lines, steamers, construct bridges and wharves; also to run a freight and passenger ferry between the western end of the California & Nevada railroad tracks in Oakland and this city. Capital stock, $500,000. Directors—J. W. Smith, Abner Doble, J. J. Scrivner, C. K. Klog and M. J. Keller.

CHARLOTTE RAISIN VINEYARD CO., Sept. 23. Capital stock, $64,000. Directors—I. H. Morse, G. A. Fisher, W. R. Drake, H. L. Davis and G. W. Turner.

SAILOR CONS. M. CO., Sept. 24. Capital stock, $600,000. Directors—H. S. Dexter, W. Dreffenbacher, G. Webe, G. Dawson and H. Eickoff.

CORONADO ISLANOS STONE AND IMPROVEMENT CO., Sept. 24. Capital stock, $100,000. Directors—O. T. Dyer, F. V. Macdonald, D. S. Dorn, S. Miller and C. Waterhouse.

MINERS IN POLITICS.—It is worthy of note that both of the political parties, one in its platform and the other by resolution of its committee, approve of "such legislation as will allow hydraulic mining under restrictions that will not allow such mining to injure farmers or the navigable rivers of the State."

THE price of manufactured sealskins has advanced 20 per cent, and importers have advanced their stock 50 per cent.

Assessment Notices.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of August, 1890, an assessment, No. 19, of six (6) cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of September, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of October, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office, Room 11, No. 303 California Street, San Francisco, California.

EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.
Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

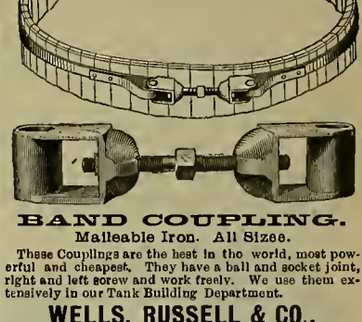
PARTS II AND III.
Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.



BAND COUPLING.
Malleable Iron. All Sizes.
These Couplings are the best in the world, most powerful and cheapest. They have a ball and socket joint, right and left screw and work freely. We use them extensively in our Tank Building Department.

Practical Treatise on Hydraulic Mining.
By AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of sluicing; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

SOME CHOICE TECHNICAL TREATISES!

LIST No. 2.

DAVIS.—A Practical Treatise on the Manufacture of Bricks, Tiles and Terra Cotta, etc, including Fire Bricks. By Chas. T Davis Second edition, thoroughly revised. Illustrated by 217 engravings, 500 pages, 8vo. Price...$5.00

DAVIS.—The Manufacture of Leather, including Tanning, Tawing, Currying, Finishing, and Dyeing of every kind of Leather. By Chas. T. Davis Illustrated by 302 engravings, and 12 samples of dyed Leather, 824 pages, 8vo. Price.....$10.00

DAVIS.—The Manufacture of Paper; Containing the various processes for the fabrication, coloring and finishing of every kind of Paper, as well as the different Raw Materials. By Chas. T. Davis. Illustrated by 180 engravings, 618 pages, 8vo. Price.....$6.00

DAVIS.—A Treatise on Steam Boiler Incrustation and Methods for Preventing Corrosion and Scale. By Chas. T. Davis. Illustrated by 65 engravings, 141 pages, 8vo. Price.....$1.50

DAWIDOWSKY.—A Practical Treatise on the Raw Materials and Fabrication of Glue, Gelatin, Gelatin Veneers and Foils, Isinglass Cements, Pastes, Mucilages, etc. Translated and edited from the German by William T. Brannt. Illustrated by 35 engravings, 297 pages. Price.....$2.50

DUPLAIS.—A Treatise on the Manufacture and Distillation of Alcoholic Liquors. From the French of M. M. Duplais by M. McKenney, M. D. Illustrated by 14 folding plates and several wood engravings, 743 pages, 8vo. Price.....$10.00

FRANKEL-HUTTER.—A Practical Treatise on the Manufacture of Starch, Glucose, Starch-Sugar and Dextrine. Based on the German of Wagner. Illustrated by 58 engravings, 344 pages, 8vo. Price.....$3.50

GREENWOOD.—Steel and Iron: The Practice and Theory of the several Methods in their Manufacture. 97 diagrams, 536 pages, 12mo. Price.....$2.00

HASERICK.—The Secrets of the Art of Dyeing Wool, Cotton and Linen. By E. C. Haserick. Illustrated by 323 dyed patterns, 8vo. Price.....$7.50

HOFFER.—A Practical Treatise on Caoutchouc and Gutta-Percha and the Manner of Mixing and Working them. From the German by Wm. T. Brannt. Illustrated. 278 pages, 12mo. Price.....$2.50

KINGZETT.—The History, Products and Processes of the Alkali Trade. With 23 illustrations, 247 pages, 8vo. Price.....$2.50

MAKINS.—A Manual of Metallurgy. Illustrated by 100 engravings, 532 pages, 8vo. Price.....$3.00

NAPIER.—A System of Chemistry applied to Dyeing. Illustrated, 422 pages, 8vo. Price.....$3.50

O'NEILL.—A Dictionary of Dyeing and Calico Printing. 491 pages, 8vo. Price.....$3.50

THAUSING.—The Theory and Practice of the Preparation of Malt and the Fabrication of Beer, with especial reference to the Vienna Process of Brewing. By Julius E. Thausing. Translated from the German by William T. Brannt. Thoroughly and elaborately edited by A. Schwarz and Dr. A. H. Baner. 140 engravings, 8vo, 815 pages. Price.....$10.00

Three-fourths to Fifteen Horsepower.
From $175 to $1200.
Send for Our Large Illustrated Catalogue.

GEORGE HAAS, 824 Market St., Phelan Building, } SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It does my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.
Yours truly, GEO. HAAS.

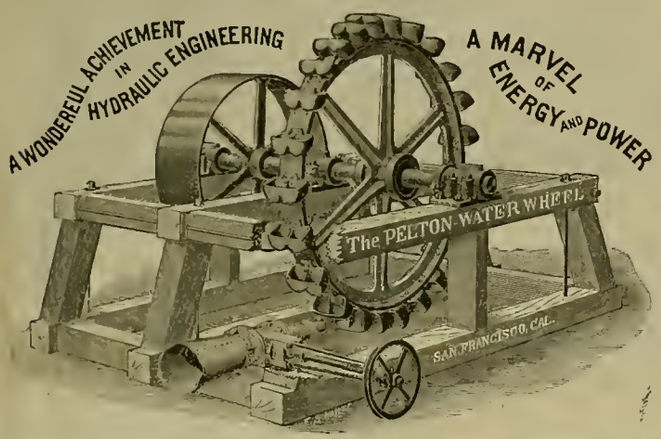
Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat gives more room; the boat will seat twice as many persons as one the same size fitted up with a steam engine. It takes only two minutes to get under headway, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

REGAN VAPOR ENGINE CO., 221-223 First St., San Francisco, Cal.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.



A WONDERFUL ACHIEVEMENT IN HYDRAULIC ENGINEERING
A MARVEL OF ENERGY AND POWER
The PELTON WATER WHEEL
SAN FRANCISCO, CAL.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

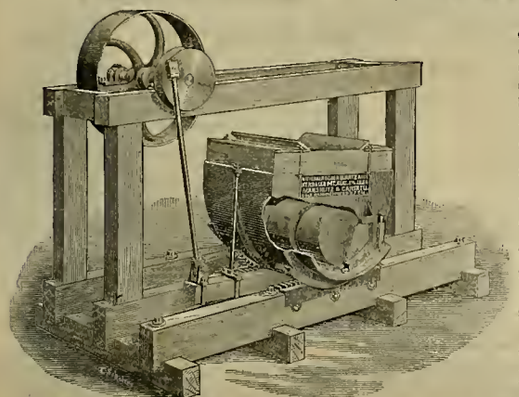
AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 25, 1890.

General trade is reported exceedingly active, but not more so than usually obtains in the fall of the year. Money is easy, with no particular call from any branch of trade or speculation. Remittances from the interior are quite free.

MEXICAN DOLLARS—The market is quiet. The recent decline in silver has a depressing influence. Quotations are given at from 88@89c.

SILVER—The Mint-counter rate has ruled at $1.13½ an ounce. Washington telegrams report as follows: On 22d, the silver offered the Treasury aggregated 1,035,000 ounces. The amount purchased was 250,000 ounces at $1.150. On 24th, the amount of silver offered to the Treasury aggregated 338,925 ounces, and the amount purchased, 140,000 ounces, as follows: 25,000 ounces at $1.136, 90,000 ounces at $1.13625, 25,000 ounces at $1.1375. The total purchased, including to-day's purchases, under the new law, is 7,172,474 ounces, leaving about 107,000 ounces to be purchased during the remainder of this month. On Oct. 1st, the Department will commence buying the regular quantity, 4,500,000 ounces, per month, making each month end with the last day of the month, instead of the 13th day as was done the first month's purchasing.

QUICKSILVER—The market shows a firm tone. The demand is fairly active for the season. The receipts the past week aggregate 195 flasks, and exports by sea, 10 flasks to Auckland.

LIME—Receipts the past week aggregate 4209 bbls. The demand continues free, but dealers do not care to carry stocks, owing to the lateness of the season.

BORAX—The market is firm, with a steady market reported at the East.

LEAD—The market is very strong. The East reports a strong and higher market under firm holding by the pool. English advices report better markets on that side.

COPPER—The mines on this coast are reported to be turning out their regular quota. New York advices report a strong market, with Lake sold ahead at 17c. Arizona ingot is firmer at 15¼c. Casting copper is 14⅝ to 14⅞c. A London cable to the *Iron Age* of Sept. 18th, reports as follows: The control of the market is in strong hands, and a still further rise in prices is considered likely.

TIN—The local market is cornered and pending arrivals, due on Saturday, quotations are given at 25@26c. Large consumers refuse to take at these prices, preferring to wait for the arrival of the Australian steamer. At the East and in Europe the markets are very strong. The advance in Europe is due to higher prices for silver and threatened labor strike.

IRON—The market is fairly steady. The stock here is being steadily depleted, but it is claimed that free shipments have been and are being made from England. A cablegram from London to *Iron Age*, Sept. 18, says: Operations have been on a larger scale, and stimulated the prospect of a strike by furnace workers taking place next month. Reported scarcity of fuel and consequent increased cost of production also tend to promote speculation, while rapidly declining stocks and improvement in the trade demand serve to strengthen the position materially.

COAL—Imports the past week aggregate as follows: Overland, 20 tons; Seattle, 7986; Tacoma, 6300; Coos Bay, 720; Nanaimo, 3480; New Castle, N. S. W. 3060. Total. 21,566 tons. From Vancouver 120 sacks of anthracite were received. The market is very strong for Australian in all positions. The spot supply is about exhausted, while nearby arrivals are cared for. Labor troubles in Australia are against prompt shipments. English advices report free engagements, but they are distant arrivals. Wellington coal is hard to get.

Eastern Metal Markets.

By Telegraph.

NEW YORK, September 24.—The following are the closing prices the past week:

	Silver in Londn.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	.53½	1 16	$16 75	$5 07½	$23 25
Friday	.53⅜	1 15½	16 75	5 10	24 50
Saturday	.53½	1 15½	16 75	5 07½	24 50
Monday	.53	1 15	16 75	5 12½	25 00
Tuesday	.52	1 12¾	17 00	5 12½	25 10
Wednesday	.52	1 13	17 00	5 12½	23 00

NEW YORK, September 23.—Quicksilver is higher and strong at 78@80c. Borax is unchanged. Last Copper rates rule full. Consumers purchase up to about the usual wants. Some export demand is noted. Pig Lead better. After sales, 300 tons at $5.05; $5.07½ asked. Tin scarce and very firm.

ON the Mokelumne river, in Calaveras county, there is a mine the ore of which goes $1 42 per ton. A German named Herman Trip is the owner, and has erected a mill on the property. Last month's run yielded him $1700. His expenses were $700, leaving him just $1000 clear profit. We do not believe there is another mine of low-grade ore in existence that can be worked so remuneratively.—*Union Democrat*.

Cement Kilns.

(*Concluded from page 199*)

Let Section 1 be loading and 2 unloading, the air for combustion goes in at the doors of Sections 1 and 2 and passes successively through Sections 3, 4, 5 and 6, which have been in heat to 7 and 8, the ones in which the fuel is being used; the heated gases pass from 7 and 8 on around through the sections until they reach 14, where they enter the flue to smoke chamber.

The air passing in doors 1 and 2 as it goes through Sections 3, 4, 5 and 6 takes up heat, cooling the burned material. By the time the air enters 7, it has become so heated that it will make a small bar of iron red hot. Sections 6 and 7 were in heat yesterday, 5 and 6 the day previous; to-morrow, in place of 7 and 8 being in heat, 8 and 9 will be, and 7 will be cooling; then the dampers between 14 and 1 will be opened and that between 1 and 2 closed; the valve in the smoke flue of 14 will be closed and that of 1 open; then Section 2 will be loading and 3 unloading.

The materials in Sections 9 and 10, the ones beyond those in which the fuel is being used, are in such a state of heat that the carbonic acid is nearly all expelled and ready to clinker, the next two are getting hot, the last two, 13 and 14, are drying.

The heated gases from the sections on fire give up their heat in passing through the unburned sections, so that when they enter the smoke chamber they are cooled below 160° F. The material to be burned is arranged in the sections something similar to a brick kiln. As will be seen in the sketch, there are 14 sections, one being burned each day, requiring 14 days to complete the circuit. Kilns on this plan can be made much smaller, having less and smaller sections.

There are other modes of burning, but the great cost of kiln precludes their general use.

Cements have also been burned with wood and coke, and there is no reason why wood alone could not be used.

Crude petroleum oils can also be used to burn cement, and are being used for that purpose in Pennsylvania. This fuel could not be applied successfully to the dome kiln, but could be applied to a Hoffman or ring kiln (shown in the engraving. Taken from the State Mineralogist's report), such a method being particularly applicable to the southern part of California.

San Francisco Metal Market.

Mining Share Market.

Mining shares the past week exhibited continued strength for the higher-priced Comstocks, with, toward the close, a slight advance in Challenge, Confidence and Savage. Andes continued its erratic moves, allowing chippers fine opportunities of guessing the next move. Occidental acts as if it is being peddled out on the mill-starting-up proposition. The Alta group hang around at recent quotations. It looks as if the pool is concentrating them preparatory for an upward move soon, either before or soon after the Alta pumps are started up.

In outside stocks the Tuscaroras have shaded off under light trading. Central, Peerless and Crocker of the Quijotoas have a firm tone, The Bodies advanced sharply on Mono's assessment.

The market has an exceedingly healthy tone for an up move. Recent developments in the Hale and Norcross mine management are undoubtedly causing large capitalists who are reputed to be interested in the mines and mills, to look into affairs on the lode with the view of righting the wrongs that are firmly believed to be practiced in the working of the mine and milling of ores. At any rate, several of the mine superintendents' reports are improving, and now if they will follow the Overman's superintendent's reports and give the car sample assays as well as the battery assays, it will be a long step on the road to reform. With the mines worked in the interest of shareholders, we would soon have a mining stock boom, for a good class of buyers would undoubtedly come to the front as dealers.

The news from the Comstock mines grows more interesting. In Con. Virginia on the 800 level they have run west a distance of over 1200 feet from the old shaft and struck in the Andes ground the Red ledge, that this paper has persistently spoken of. The ledge is very rich in gold. There is a rumor that in Ophir on the 500-foot level they have found something in the west drift in that part of the mine known as the Burning Moscow ground lying north of West Con. Virginia. In Ophir on the 1300 and 1400 levels going west they have run into a very rich gold-bearing quartz or ledge farther west than before penetrated. The find on the 500 level is its upward continuation. In Mexican, very important work is under way. The Savage company has commenced taking out the rich ore on the 1300 level. Important prospecting work is being done in this mine, as is also being done in the Hale and Norcross. From Alpha and other Gold Hill mines important work is going on, and rich strikes are not at all unlikely to be reported any day. The work going on in the Ward shaft is being closely watched. The pump in Crown Point is being tested. It is probable that it will be accepted soon, when pumping out of the Gold Hill mines will be commenced. Several of the mines may be assessed to pay expenses, so say reports.

From the outside mines the news is about as heretofore published from the Tuscarora and Quijotoas districts. From the Bodies our news reports the streaks improving, and more encouragement is felt in finding a rich pocket. This news is confirmed in this city. The action of the stock also shows it.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

* Assessment de inquent.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The Pittsburgh Boiler Scale Resolvent.
This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.
CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.
We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.
Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad. Very truly yours, WM. R. JONES, Gen. Supt.
No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Allegheny Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.
Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:
{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }
FOR SALE ONLY BY

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.Co BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.
NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.
C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.
C. A. LUCKHARDT & CO.,
(Formerly Hubn & Luckhardt,
Mining Engineers and Metallurgists.

GREAT REDUCTION!
BATTERY SCREENS.
Best and Cheapest in America.
No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.
I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL
For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.
Inventor and Manufacturer of the celebrated Slot Cut or burred and Slot Punched Screens.
Mining Screens a specialty, from No. 1 to 15 (fine).
Orders promptly attended to.
San Francisco Pioneer Screen Works,
221 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

WM. H. CONLY,
Lands, Mining and Commission,
124 SANSOME STREET,
Rooms 21 and 22,
Telephone No. 5057. SAN FRANCISCO.

TUBBS CORDAGE CO.
(A Corporation.)
Constantly on hand a full assortment of Manilla Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.
611 & 613 Front St., San Francisco, Cal.

AMALGAMATING MACHINERY.
Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS,
MINING MACHINERY

CONCENTRATING MACHINERY.
Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL....

IMPROVED STEAM STAMPS

Hoisting Engines,
Safety Cages,
Safety Hooks,
Ore CARS, Water & Ore BUCKETS,
Air Compressors,

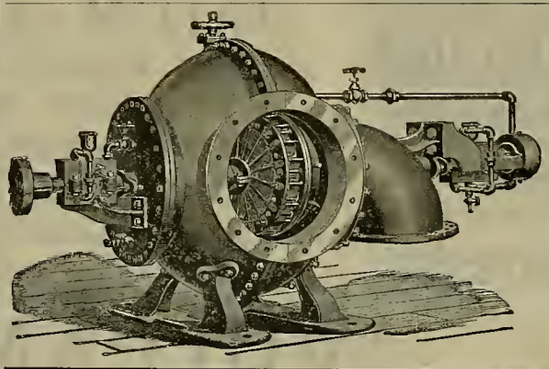
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S
Mining Turbine Water Wheel.



These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

RISDON IRON & LOCOMOTIVE WORKS,

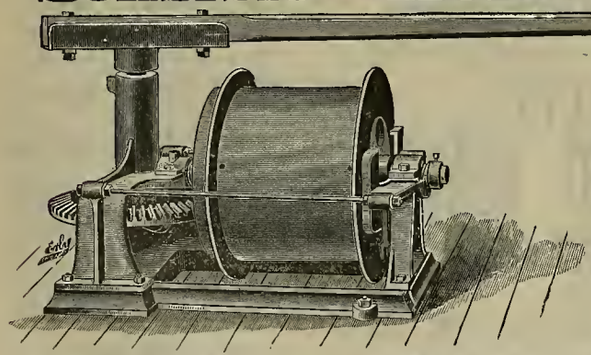
SAN FRANCISCO, CAL.

"Sensible" Horse Power Hoisting Whims.



These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

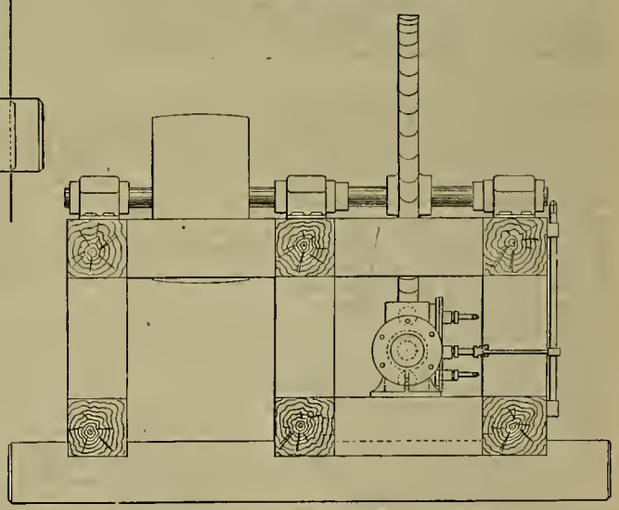
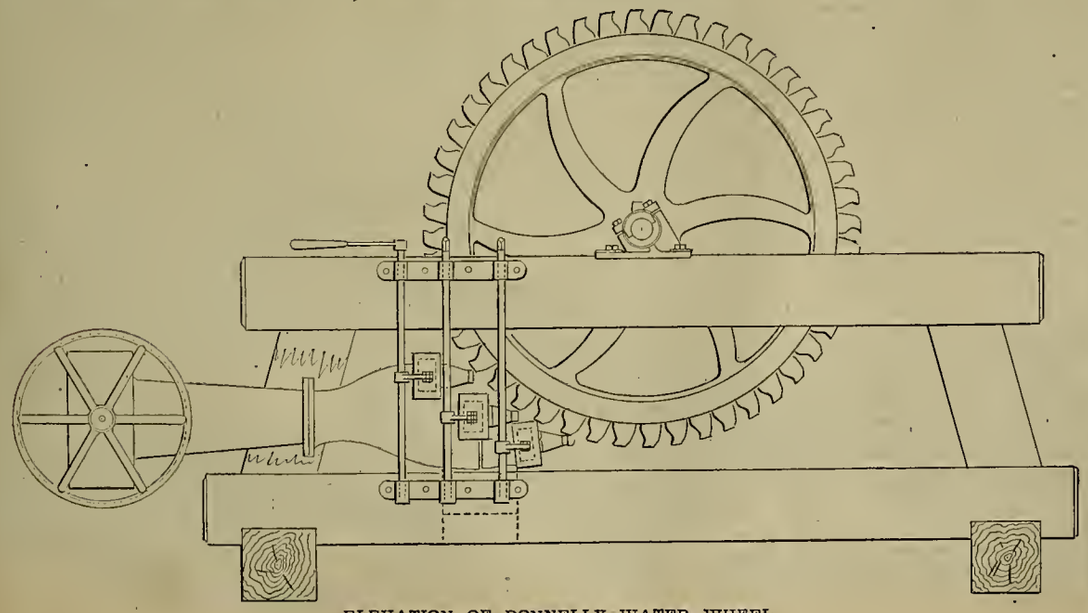
PLAN OF THE DONNELLY WATER WHEEL.

The Donnelly Wheel.

This wheel has its buckets riveted on to, and not cast, with the wheel, as is the case with the Knight. The jet of water impinging on the wheel is not split by a peculiar construction of bucket, but the Donnelly bucket has a very favorable shape for allowing a free discharge of water from the wheel as soon as the force due to the weight of the water has been imparted. The manner of the application of the water to the wheel, as well as the shape of the bucket, is one of the chief points of merit. The round nozzle is used in applying the water, instead of the elliptical or oblong nozzles which are best adapted to the peculiarity in the shape of the Knight bucket. During the last four years quite a number of these wheels have been called into requisition in the counties of Amador, Calaveras, El Dorado and Nevada, and have given satisfaction. A notable instance of the efficiency of these wheels is presented at Plymouth, Amador county, where one of them, under 561 feet of pressure, drives the 80 stamps of the Empire mill with 75 measured miners' inches of water. Another instance may be cited of the Seaton mill, near Drytown, containing 20 stamps driven by 42 inches of water applied to a Donnelly wheel, under 230 feet of pressure. These examples are given because circumstances allowed easy and exact measurement of the water. The Donnelly wheel, like the Knight and Pelton, belongs to the order of "hurdy-gurdy" tangential or pressure wheels.



END VIEW OF THE DONNELLY WHEEL.



ELEVATION OF DONNELLY WATER WHEEL.

The State Mining Bureau and the Legislature.

It is interesting to observe how our various California industries have, from small beginnings, been developed little by little until they have reached their present large proportions and obtained here a lasting foothold. It has been the policy of the State to aid these industries, not always at first, but accordingly as they have seemed to deserve it, private enterprise having first given them a start. In consonance with this policy, laws have from time to time been enacted in aid of agriculture, manufactures, viticulture, forestry, fisheries, land reclamation, irrigation, mining, etc., whereby there has come to be engrafted upon the Executive Department of the State a number of Commissions, Agencies, Bureaus and the like, mining having been among the last of these industries to be so taken under the fostering care of the commonwealth.

In view of the good work that the State Mining Bureau has accomplished since its creation, public sentiment would seem to favor a continuance of the support now being extended to it by law. That the mining community will expect this much at the hands of the incoming Legislature is certain, the several reports prepared by the State Mineralogist having proved so helpful to that class that it can hardly be supposed they will willingly forego these benefits in the future. The hardy toilers in the mountains feel that they are entitled to share with the rest of our citizens the bounty of the State, the more so in that this bounty, postponed to a very late day, has since been dealt out but grudgingly.

CEMENT FROM A NEW QUARTER.—Two hundred barrels of cement, manufactured at San Diego from the deposit of raw material at that place, were received at the port of San Francisco last week.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Comstock Superintendents' Salaries.

Editors Press:—The *Territorial Enterprise* in a recent issue indulges in a few sarcastic remarks about the "blear-eyed crew of Pine street," which they say annoys the mining superintendents of the Comstock by its importunities for anything from a quarter of a dollar to five dollars. It's an ill-natured brute that growls at the hand that feeds it, and this, from the apparently official organ of these gentlemen, comes with bad grace. Upon investigation, we find that the following salaries are paid each month to some of these mining superintendents:

S. L. Jones—		
Crown Point	$500 00	
Belcher	500 00	$1,000 00
W. E. Sharon—		
Union Mill & Mining Co. (est'ted)	$500 00	
Confidence	250 00	
Challenge	250 00	
Yellow Jacket (estimated)	500 00	
Con. Imperial (estimated)	500 00	$1,250 00
A. C. Hamilton—		
Chollar	$250 00	
Potosi	250 00	$500 00
R. P. Keating—		
Hale and Norcross	$400 00	
Savage	400 00	
Scorpion	150 00	$950 00
P. Kerwin—		
Best and Belcher	$250 00	
Gould and Curry	250 00	$500 00
D. B. Lyman—		
Con. Cal. and Va	$187 50	
Mexican	187 50	
Ophir	187 50	
Occidental	150 00	
Sierra Nevada	200 00	
Union	125 00	$1,087 50

As none of these properties are paying dividends and but few of them paying expenses, it can be seen that assessments paid by the "blear-eyed crew of Pine street" are furnishing the funds that enable these worthy superintendents to receive salaries large enough to permit them Palace-hotel luxuries, two-bit cigars and "shampagny" water, while the "blear-eyed crew" rustle for beans and cold potatoes. In view of these facts, it is certainly unkind of these well-paid gentlemen to complain when one of their patient constituents and supporters, temporarily discommoded by assessments levied to extract $300 rock, extends his or her hand for just sufficient to bridge over a few days on cold potatoes.

Perhaps it is wrong to ask these hard-worked corporation servants to share their petty stipends with the "blear-eyed crew." The intense application with which some of them devote themselves to their duty is evidenced by the registers of the Palace hotel at San Francisco and the leading watering-places on the coast. Clad in stylish apparel, with the cooling breezes of the Pacific fanning their manly brows, wrinkled with the care of taking out porphyry bowlders that assay $2461 per ton, or in devising ways to help the poor miner by mixing and reducing $477 ore, so that he and the "blear-eyed crew of Pine street" may pay assessments to take it out, they are entitled to the commiseration and sympathy of every right-thinking person. We are very sure that if the "blear-eyed crew" had ever known how badly these poor superintendents were abused, they would have long ago stopped paying assessments and permitted them to get back where they belong and strike a drill with the same efficiency they have shown in the past.

Mining Stock Association,
J. H. Tingman, Vice-President.

Notes from Arizona.

Editors Press:—The O. K. Mining and Milling Co., near Hackberry, Mohave Co., have their mill in condition so that it will soon be crushing ore. The property is under the management of Frank Welsh, who informs your correspondent that the outlook for his company is splendid.

Kingman, Mohave Co., Arizona, is an important mining center. There are two companies having sampling works at this place, one owned by Lake & Smith and the other known as the Arizona Sampling Works, of which Jno. Lynch is manager and principal owner. Mr. Lynch draws his samples from a radius of 100 miles, but mainly within a circuit of 10 to 40 miles. The mining interests of Stockton Hill, Mineral Park, Hackberry, Arizona, and as far westward as Daggett, Cal., concentrate at Kingman. It is on the line of the A. & P. R. R. and has important commercial as well as mining interests. The Taggart Mercantile Co. and Beecher & Co. do an extensive business. Kingman is certainly a promising camp. P.

A Bruckner Furnace Lining.

Editors Press:—Noticing the article in your paper, some two weeks ago, in regard to the Bruckner furnace, and that it had to be lined with firebrick, I would say, in connection therewith, that there is a Bruckner furnace in a silver mill in this district in which there has already been roasted over 2000 tons of ores, and the lining of the furnace is as good as when first put in. This furnace was lined with adobes made out of a peculiar yellowish clay that is found here, and mill tailings mixed in.

The process of making the adobes was as follows: First, the clay was screened to clean it from gravel, and then was thoroughly ground and mixed with tailings in an adobe mill, then molded and well dried in the sun.

The furnace was then lined with the dry adobes and set in with the clay mud. The furnace lining was then plastered with a mixture of clay and salt, and was then allowed to dry. After getting thoroughly dry, a low fire was built in the furnace and salt thrown in and allowed to roast, and the furnace is then ready for use. Care has to be taken in discharging the roasted ores and not pull out the lining with the iron rakes. The better plan is to open the discharge-gate and let the furnace revolve and discharge itself.

This furnace lining will last as long as firebrick, and can be put in at less than one-fourth the cost of firebrick, where freights are high.

Bernice, Nev. G.

Mines of Sonora, Mexico.

Editors Press:—The rainy season in Sonora set in with a violent tempest July 26th and continued in full force till this date. For 25 years, or since the French Intervention, the inhabitants say there has been no parallel. High water has continued all the time; roads and fields are washed away. The Sonora railway as well as the A. & N. Mexico had its line torn out and traffic was suspended for nearly a month. In the interior of the State, mails did not arrive for weeks at a time; to mining industry it was disastrous, but will in the end result in lasting benefit.

Most of the mines and mills suspended for want of proper supplies; the Prietas Co., Torres Station; also the mill belonging to Chamberlain & Price. The latter company, for a long time paralyzed for want of water, has recently started on full time, and it is said is doing remarkably well.

The Prietas Co. are introducing a new process so that they may successfully treat the rebellious ores of the Grand Central mine. It is said that several new companies are about to initiate work preparatory to erecting mills in this district. The Yeso mine of Fresh and Magruder was suspended about 15 days by the rains and had several buildings unroofed by the wind, including part of the mill. Their ore is said to be improving very much as they develop the new works in La Gloria mine. It is to be hoped that the owners of this property may reap the reward their constant perseverance in the past under discouraging circumstances merits.

The Gavilan property, on which the mill has run intermittently for about a year, is said to be a good one. At first there was difficulty in treating the ore, owing to the inefficiency or ignorance of the millman. This difficulty was overcome later, and it was found that the ore was free amalgamating. The company own three mines, all situated on the same vein, the greater part of the ground being undeveloped and unprospected. If the company had a more liberal amount of capital they could make a much better showing.

It is reported that parties are negotiating with a view of acquiring the property, forming an incorporated company, and thus, with additional working capital, prosecuting the work actively. The property is good and the 10-stamp mill is substantially new and runs well. The situation is all that can be desired.

The Las Delicias property is at a standstill as far as the mill is concerned. The mine is being developed, a process it needed very much, as it was in an unopened state. It has been up to now impossible to treat the ores up to a high percentage. The new owners claim they have a "beneficio" which attains the much-desired and long-sought percentage; if this be true, the property is a good one, as the ore supply is apparently boundless.

The Oro Negro Co. near Arizpe is said to be doing well. Their mines are described as very rich and large in extent. The mill and roasters are fine pieces of work. No expense has been spared to make things good and well arranged.

The Milford Gold Mine Co. is not moving their Wiswell mill. It is said that a new company is about to erect a stamp-mill at the mine.

Hermosillo, Sept 17, 1890. Anon.

Silver King, Arizona.—A correspondent writes us as follows: Nothing going on here in the way of mining outside of the Silver King, and they are doing no good, only working a handful of men. They are now sinking the hilk shaft which is west of the King. I am informed that they will sink this shaft 1400 feet from surface, which I think is folly. They have not found any ore in this shaft and I am of the opinion that they will not find any, no matter how deep they sink it—that is, Silver King ore—but should they go back to the 900 and 800 foot levels and prospect the ground east of the "old" King shaft, from those points I believe they would find the Silver King mine. Although silver is up to a good price, still there is no effort being made by companies owning property here as yet to do development work.

One of the largest iron mines in the known world is a lead or a strata of magnetic iron ore near Neihart, Montana, that is 20 feet in width and crops out of the ground for a distance of 9000 feet.

Steam Plowing at the State Fair.

[Written for the Press.]

The exhibition of traction engines at the State Fair this year attracted great attention and was one of the leading features of the mechanical department. Two of them were shown each evening under steam in the pavilion, and were nearly always surrounded by a crowd of solid-looking men from all parts of the coast, who examined them with the closest scrutiny. An exhibition of their capacity for plowing was given at Coyle's ranch, about three miles from town, on the forenoons of Tuesday, Wednesday and Thursday of the last week of the fair. Notwithstanding the distance from town and the lack of public conveyance, there were hundreds present each day and the interest manifested showed a realization of the fact that steam is about to supplant animal-power to a large extent for farming and freighting on this coast in the near future.

The machines that took part in the exhibition of plowing were the following:

1st. The "Pathfinder," weight 13 tons, pulling 12 ten-inch plows divided into three gangs of four plows each, the gangs being attached to the machine by three chains supported by a sort of cart.

2d. The "Native Son," weight seven tons, pulling eight ten-inch plows (two gangs of four plows) attached to the engine by chains like those on the Pathfinder.

Both the above were made and exhibited by Daniel Best of San Leandro.

3d. The Jacob Price field locomotive, made by Jacob Price of San Leandro, Cal., and Racine, Wisconsin; weight, 8½ tons, pulling twelve 11-inch plows which were attached to a light triangular platform from which the gang levers were operated. The 12 plows were divided into four gangs of three plows each.

4th. The Baker & Hamilton engine made by the Benicia Agricultural Works; weight, 13 tons, carrying twelve 12 inch plows attached to a very elaborate and powerful frame having a device for raising and lowering the plows by steam.

The ground selected was a sort of yellow cement very hard and dry, having had no rain or other moisture upon it for nearly four months. The universal opinion before operations commenced was that no plowing could be done because of the hardness of the ground; but all the machines set to work at once, and by putting men on the gangs, made them take hold, ripping the ground up in great lumpy billows instead of furrows. Each machine went a round or so in a sort of go-as-you-please manner, but doing the work successfully; and 1 o'clock having arrived, the crowd left for town, thus ending the first day.

The second day the machines were required by the committee to go three rounds each (about 2½ miles) without stopping and to maintain, if possible, their steam pressure and to have as much water in the boiler at the end of the three rounds as when starting.

This was successfully done by the Best and Price machines, and would probably have been done by the Baker & Hamilton machine but for an accident that disabled it.

The third day was devoted to a further trial with the Baker & Hamilton machine, which again became disabled, and wound up with a sort of foot-race between the Pathfinder and the Price machines, the latter making a round of nearly a mile, with its 12 plows, in 10½ minutes. The Pathfinder tore away from the starting-point with a speed that would have taken it around in even less time had a plow not broken from its fastenings and plunged into the ground so deeply the whole outfit was brought to a standstill when about three-fourths of the trip was made.

This ended the exhibition, which was pronounced by all as being simply wonderful, one enthusiastic committeeman saying that if he could have his way he would give each machine a gold medal as big as a dinner-plate, for showing so conclusively that steam plowing is practicable.

The farmers present estimated that it would have required from 50 to 75 good horses to have pulled, even slowly, either system of 12 plows that were so rapidly and easily drawn by the different engines. The contest between the Price machine and the larger one of Best's was very close, as will be seen from the following

Report of the Committee:

We, your Committee on Traction Engines, respectfully report as follows: After a careful examination of the several traction engines, we award the premium to the one called "The Pathfinder," manufactured by Daniel Best of San Leandro.

The engine manufactured and exhibited by Jacob Price of San Leandro deserves special mention, being a close rival to the Pathfinder. So nearly equal are the two engines that the committee had great difficulty in deciding which was the better. In evidence of which, the committee on the final ballot stood three for the Price and four for the Best ("The Pathfinder").

The Benicia Engine, manufactured by the Benicia Agricultural Works, is also entitled to great praise. It possesses many fine features, and for heavy work, simplicity of construction and economy of fuel, was the peer of any in the contest; but, unfortunately, it became disabled early in the contest, which virtually precluded it from further competition.

The Pig-Iron Industry.

The Census Office has issued a bulletin showing the production of pig iron in the United States for the year ending June 30, 1890. Great credit is due Dr. William M. Sweet of Philadelphia for this magnificent achievement in statistical work. The following points condensed from the report will no doubt be read with interest:

The production of pig iron for the census year of 1890 was the largest in the history of the iron industry in this country, amounting to 9,579 779 tons of 2000 pounds, as compared with 3,781,021 tons produced during the census year 1880, and 2,052 821 tons during the census year 1870.

From 1870 to 1880 the increase in production amounted to 1,728 200 tons, or nearly 85 per cent, while from 1880 to 1890 the increase was 5,798,758 tons, or over 153 per cent.

The pig-iron industry of New England has been practically stationary during the last 20 years.

Pig iron is now made in 25 States and Territories.

Pennsylvania produces about one-half of all the pig iron made in the United States.

Ohio retains second place, dropping, however, from 14 per cent in 1880 to 13 per cent in 1890.

Alabama advances from tenth place in 1880 to third place in 1890. Her increase over 1880 is 1328 per cent.

Illinois, which was seventh in rank in 1880, is fourth in 1890.

New York retires from third to fifth place. Virginia advances from seventeenth to sixth, and Tennessee from thirteenth to seventh.

As showing the greater size and capacity of furnaces in 1890 over those of 1880, the fact is demonstrated that, while the production of 1890 was 5,798,758 tons greater than that of 1880, the number of completed furnaces actually decreased from 681 in 1880 to 562 in 1890. In other words, the average yearly capacity in 1880 was 5552 tons, while the average yearly capacity of furnaces reported in 1890 was 17,046 tons.

The nine Southern States produced only 350,436 tons in the census year 1880. In 1890 they produced 1,780,909 tons, an increase of 408 per cent.

Kentucky alone, of all the Southern States, shows a decrease in production amounting to 25 per cent.

Six Western States, Illinois, Indiana, Michigan, Missouri, Ohio and Wisconsin, produced in 1890 2,522,351 tons, against 995,335 tons in 1880, an increase of 153 per cent. Indiana, alone of these States, reports a falling off, amounting to 37 per cent.

During the decade, the use of anthracite has fallen off 71 per cent, while the use of mixed anthracite coal and coke has increased 163 per cent; coke and bituminous coal, 343 per cent; charcoal, 51 per cent; and castings direct from furnace, 135 per cent.

Of Ohio's product in 1879, viz., 1 302 299 tons, the Mahoning Valley produced 527,164 tons, or nearly half.

The production of Bessemer pig iron in the United States during the census year 1890 amounted to 4,233,272 tons, of which Pennsylvania made 2 567,813 tons; Illinois, 616,654 tons; Ohio, 516 654 tons; and other States much smaller quantities.

One hundred and forty-nine thousand nine hundred and fifty-nine tons of spiegeleisen were produced in the census year 1890.

Prospects Not Worked.—There is a better feeling for the future prosperity of Crested Butte than for a long time. The prospects of railroad building and the opening of the marble industry are very encouraging, to say nothing of the improvement of the silver mines by the summer development. Then again, the advance in the price of lead and silver has kindled more hope and a better feeling within the breast of the ever-hopeful miner. It is a remarkable fact, however, that notwithstanding strenuous efforts have been made to make mining sales, very few, if any, have been made. Capitalists and experts come in and look around, then go out without buying. Why it is we cannot account for. We know that prices are not unreasonable, at least in most ones. It is true there are a few who are afraid to put a price on their property, and should any one approach them to purchase they will not sell for fear they will not ask all that they might possibly get from some other source. We expect we could name 50 mines tributary to Crested Butte that could be producing, paying mines if they were only owned by persons who would work them as such. The most of these properties have got to change hands before they will ever amount to anything, and the sooner they do the better it will be for the country.—*Elk Mt. (Col.) Pilot.*

Says the Grass Valley *Telegraph:* The old Allison Ranch mine stands out gloomy and unworked, with a splendid history and with millions in the ledge that is not very deep under the ground. The Allison Ranch mine ought to join the splendid procession of Grass Valley old mines that are being reworked. But the Allison Ranch mine is owned by men who have all the money they want.

The steam-power of the world has more than doubled in the last 15 years.

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XIII.

[Written for the Press by James H. Crookman.]

Slover Mountain Marble and Lime.

Slover mountain is an isolated butte situated in Township 1 South, Range 5 West, San Bernardinn meridian, three-quarters of a mile in a southwesterly direction from Colton. It is 977 feet above the level of the sea, and its greatest elevation is only 700 feet above the plain in which it occurs. Its dimensions from base to base are 3900 by 2600 feet, covering a superficial area of 10,146,000 square feet.

This mountain, though unimportant in dimensions, contains an immense storehouse of mineral wealth, and as a producer it can hut add largely to the prosperity of San Bernardino county.

The mountain as an entirety is owned and operated by tha California Marble and Building Stone Company, whose principal place of business is at Colton—V. P. Dyer, Esq., superintendent, with a branch or distributing office at 42 Flood Building, San Francisco—Jno. C. Pelton, Esq, manager. It is an incorporated company, capitalized in the snm of $500,000. The qoarry is under the sole control and management of Superintendent Dyer, who has had 40 years' experience in some of the most notable marble quarries in both Europe and America.

Geology.

Geologically speaking, Slover monntain, though ae a whole, to nse a conventional phrase, composed of limestone, is composite in character, ae its mineralogical make-up is dissimilar. The divielon lines between the different forms of calcareous stones are sharply drawn from north to south through its center, at right angles with its greateet longitudinal extent, which is easterly and weeterly. The eastern portion contains both carbon and magnesia, the first forming a carbonate of lime (marble), and the second magneeian limestone, dolomite, aragonite or onyx. The weeterly half is exceptionally a limestone of unnsnal purity, containing hut five per cent of foreign matter when calcined and extraneous matter expelled by heat.

In this form it is a commercial product which is in demand from its remarkable purity and brilliant whiteness, commanding a good price in all portions of Southern California.

The stratification of the mountain is easterly and westerly, dipping southerly at an angle of 20 degrees.

The first product of the marble varieties is a carbonate of lime. It is of a fine crystallization (color both a pure white and of a pearly hue), suitable for structural or etatnary purposes. The chisel gives clean-cut and sharp lines. The second (magnesian limestone), though a marble, is eo peculiar in textnre that it has not a counterpart in any of the known quarries of the world. It is crystalline in structure and homogeneous in character. Its crystals are semi-transparent, firmly held and cemented each to the other by a magnesian paste, forming a solid and impermeable mass. In color it variee from a jet black to a pearly white, from a gray to a brown, and also variegated red, yellow and green, the colors harmoniously blended. They occnr in bands, veins and streaks. There ie seen a mottled black and white, then an indescribable combination of colore, as if an artist had "pied" his palate into a common receptacle of fluid which had congealed without order or system. The lighter-colored marblee are semi-traneparent (traneleent), so much so that if cnt into thin slabs any opaque substance held between it and the sun will cast a shade similar to fine porcelain.

This quarry, though in its infancy and its product but little known, is rapidly growing in reputation, and the stone is in demand both for structural and ornamental purposes.

The Marblee

Are susceptible of an unusually high polish. Their luster is so great that the observer would think that they were inoloced in and covered by a glass plate. Atmospheric influencee, ink or citric acid do not affect them or change their color. Their intrinsic valne ie one-third greater than the imported Italian, and they can be laid down in the marts of the world at a far less price. The coloring matter of the stone consists of graphite and the oxides of other mineral products. Graphite exiete in thin veins, but not in sufficient quantities to warrant its extraction as a commercial product.

The Marble-bearing Portion

Of Slover mountain is situated on its northeasterly borders, and to all appearances ie inexhaustible. It lies in strata of considerable thickness. Development as the work progresses constantly expose new and intereeting varieties of stone. It is impossible to predict the future of this wonderful deposit.

Prof. A. W. Jackson of the University of California has made a number of analytical tests of the several varieties of the stone of this quarry, and reports that the greater portion of each variety which he teeted should be classified as a carbonate of lime, as the amonnt of magneeia present was so small that it did not justify classifying it as a magnesian limestone, technically known as dolomite.

Development.

The floor of the quarry which constitutes the main workings is situated 45 feet above the level on which the mill is situated. It is 500 feet in length by 30 feet high, and is rapidly increasing in hight as the work is extended. The hill has a slope of 28 degreee. During the writer's visit a block was quarried from the face of the works which measured 15x27x7 feet, and showed no flaws nor cracks.

Several small quarries have been opened at a greater elevation in order to test the extent, variety and quality of the marble. The highest point reached is 525 feet above tha base.

Plant.

At the time of the writer's examination, the mill consisted of three gangs of saws of the capacity of 48,000 superficial feet per month. There is also one rubbing bed, one polishing machine, turning lathe, molding machine, slab machine driven by a 75 (high pressure) horse-power engine, with a supplemental 25-horse power engine to move the stone from the quarry to the mill. This mill has been so heavily taxed with an accumulation of orders from public and private buildings in San Francisco and elsewhere that I am informed it has been necessary to treble its capacity. Nine gangs of saws are now in operation, and preparations are being made for a much larger increase. Mr. Warren T. Kimball is now en route to Europe in order to ascertain the most desirable class of machinery for that purpose. The new additional plant will cost about $30,000.

There are about 1000 tons of marble ready at the quarry for shipment. On the writer's visit, a block of marble that had just been broken from the quarry measured 27 feet long by 15 feet wide by 7 feet in thickness, showing neither crack nor flaw.

The company is making preparations to ship to San Diego from five to ten carloads per day—each car to carry a solid block of 20 tons.

Both the Southern Pacific railroad and the Santa Fe system pass under the sheds of the quarry, affording unexceptionable transportation facilities for the product to all of the markets on the continent, both east and west. Fifty men are employed in quarry and mill, and the highest prices are paid for skilled labor.

Lime.

An extensive quarry has been opened on the southwesterly flanks of Slover mountain for the purpose of extracting this stone for its product, the lime of commerce. Its length is 100 feet and hight 600 feet.

The plant consists of four patent kilns with all the modern improvements. Two of them are respectively 33 and 45 feet in hight. The first produces 75 barrels and the latter 100 barrels commercial lime daily. Two are circular, 42 feet in hight, covered by iron sheds; capacity 45 barrels each, making an aggregate production of 265 barrels per day.

Eleven cords of wood are used daily. The company has erected at the works a barrel manufactory. The wood for this purpose is transported by water and team for a distance of 21 miles from the San Bernardino range of mountains. Lime is sold at the works at $1.20 per barrel, exclusive of the barrel, for which a further charge of 25 cents is made.

The Gold Belt of California.

Ancient River Channels and Gravel Deposits.

NUMBER III.

[Written for the Mining and Scientific Press by Stephen Barton of Kernville, Cal.]

The discussion of the form of crystallization and the fineness of gold, as a prime object of inquiry, would be aside from the purpose of these articles, and they are only referred to as auxiliary to the question as to where the gold came from. Though the gravel of the ancient, lava-capped hills is nearly all quartz, enough is discernible to enable us to determine that in many cases it came from lodes formed between slate walls. Greenstone, hornblende, slate and mica slate are associated with most of these deposits, hnt the levity of the latter generally leaves it on top. At Fairplay Hill, in the south part of El Dorado county, I have seen very heavy little chestnut-brown pebbles the size of beans, probably oxide of tin. These would be deep down in the fissures and were a sure criterion of a prospect of from 50 cents to $1 to the pan. A man might work all day, however, without getting more than five pans showing the pebbles. At this point there was more evidence of great force of current than any place I have seen in these ancient deposits.

First the current had concentrated in a groove in the bedrock sloping to the south; at the bottom of this groove it had struck a detached piece of granite some ten feet in diameter and had bored a round hole entirely through it some five feet in diameter. The polish on these water-worn surfaces was as hard as glass, notwithstanding that the mass could be broken into fragments and pounded into sand with the side of the pick. The hard polish seemed to be no thicker, however, than an egg shell. At this point, as well as at a point west of Columbia, Tuolumne county, I noticed heavy deposits of water-worn pebbles of lava. At the latter place a hill composed of this form of deposit rises more than 100 feet above the great stream of basaltic lava which forms Table mountain. I have said that it seems to me that there had been two periods of volcanic activity on the Pacific Coast, and I believe this basalt was erupted after the rivers had cut channels 200 feet deep among the lava-capped hills. Since basaltic columns are rather rare in California, I will digress enough to say that six-sided columns 100 feet high, standing perpendicular, may be seen overlooking the Stanislaus, three miles northwest of Columbia.

While on the subject of deposits of different ages, I will say that on the bluffs of the Tuolumne, below the mouth of the South Fork, there is a gravel deposit some 2000 feet above the bed of the adjacent stream, and not more than 300 feet below the grade of the oldest gravel deposits. This deposit corresponds with the grade of what is called Big Gap, in the dividing ridge between the Tuolumne and Merced. In following this grade and turning to the south for three miles we trace this ancient channel among the bluffs of the headwaters of the North Fork of the Merced. At La Grange on the Tuolumne, we are presented with a series of channels of different ages, one bench rising above another in regular terraces, so that the Tuolumne alone presents us a whole volume of past geological history, without a chapter missing, from the Miocene down to the very present.

I have often said to myself, what a fund of information Prof. Whitney could have given the mining world while paid to thread these deep solitudes, if he could only have brought his mind for a moiety of the time to abstain from dilating upon the wonders of the insect world. Eugology is all very good in its place, and doubtless there is money in it, but it is sadly out of place in a mining community. As it is, our most trustworthy information in regard to the mining region is obtained from men who made their observations with a roll of blankets and sack of flour on their backs.

I have spoken of a Pliocene deposit at the mouth of Kern river canyon and running thence to White river, along the edge of the Tulare valley. There are a few places where auriferous gravels have been worked beneath this cretaceous deposit, and I think it may yet develop mines of some value; hnt the depth of the chalk, the rapid dip of the bedrock beneath the valley and the great difficulty in obtaining a water supply prevent it from becoming the site of an extended industry.

We thus see that by beginning with the oldest forms of gravel deposit we are able to descend by one unbroken series of events to the present, with a retiring ocean constantly before us, and the channels of our rivers constantly growing deeper. This change was not limited to this side of the mountains. At the beginning of the era of ancient-gravel deposit, the evidence is that the Great Basin was an immense inland sea rising to the ancient beach above Salt Lake City; that this sea received the drainage of a vast region now outturning through the Columbia; and that a powerful stream descended through Owens River valley and reached the Colorado east of Mt. San Bernardino, leaving also a Miocene deposit west of that mountain several hundred feet above the sea.

There is no use of trying to theorize away from the facts. One stubborn fact is worth a thousand theories which are not known to have a foundation. I have mentioned the finding of a conch shell in the ancient gravels of Tuolumne. It was in the possession of a miner by the name of John Glass and was found by him near Columbia. I had forgotten that he also had the shell of a cardium or salt-water clam found there of apparently the same species now found on Long Island. This shell was, however, very much petrified and had endured the ravages of time too much for its species to be certainly and accurately determined. I had also forgotten to mention that while I was mining at Columbia, two skeletons, supposed to be human, were unearthed in the Stanahan tunnel in Table mountain, and that they were given in charge of the Geological Society of Sonora. To this I must add that John Huntley, Federal internal revenue collector after the war, found a number of shark's teeth in the chalk hills north of Kern river. Hence we see that in the ancient gravels there was a mingling of land and salt-water fossils. The sea was constantly surrendering to the land.

Back of the Miocene there seems to be a tremendous gap in the geological history of the western slope of the Sierra Nevada range. The only fossils I have met with in the older formations were at Mineral King, in Tulare county, and they were probably referable to the Silurian, or at latest not later than the Clinton sandstone. Still it has been claimed that the westernmost or main gold belt was of formations referable to the age of the Jura rocks. I have failed to see a single fossil from them.

(To be Continued)

ROUND VALLEY COAL MINES.—There is much excitement in Round Valley, Mendocino county, over the coal mines. The Bank of Nevada owns 100,000 acres of coal lands near the junction of the two forks of Eel river. They have let it lay for years untouched, hnt are now spending $15,000 in prospecting it. A tunnel was run into the bed where there were some croppings close to the Middle Fork. At first the bed lay at an incline of 45 degrees, but as the tunnel ran in the slant decreased to 20 degrees. The bed varies in thickness from 8 to 14 feet, and has improved in quality as the tunnel went down. At 140 feet, water stopped the work. Pumps have been sent for. In the meantime work is being prosecuted on another tunnel across the river. The coal is pronounced an excellent article for use on railroads and steamboats. Mr. Flood of the Nevada Bank states that the Fort Bragg R. R. Co. will build into Sherwood valley, where they will be met by the owners of tha mines. It is the nearest outlet, and would greatly help the people of the Northern valleys. We sincerely hope it will prove to be more than an empty promise. The people of Round Valley are greatly elated over the prospects. Coal croppings are found along the range west of Round Valley for 20 or 30 miles to the north of the property of the Nevada Bank.—*Ukiah Press.*

Tin.

Tin Ore and What Appears Like It.

We republish, as follows, part of an article written for this journal some years ago by Melville Attwood, Esq., of this city, in view of the increasing interest in tin in this country:

In submitting to our readers this short notice on tin ore, it is perhaps desirable to make some preliminary remarks, and to state that our object is, if possible, to give the prospector searching for such ore a few plain directions, so as to enable him, without much trouble, to distinguish that ore from what appears like it, and also to point out tha character of the rocks in which it is generally met with, and thereby save the prospector a needless expenditure of time and money in looking for that ore in places where it is not to be found.

Tin stone or ore occurs disseminated in the ancient rocks, particularly granite; also in beds and veins, in large irregular masses called *stockwerks*, and in pebbles, an assemblage of which is called stream works, where it occasionally takes a ligneous aspect and is termed wood tin. The late Dr. David Forbes, at a recent meeting of the London Geological Society, in 1881, said that he had received specimens of the granite from New South Wales the region in the year 1859, and that he found them to be perfectly identical with the stanniferous granites of Cornwall, Spain, Bolivia, Peru and Malacca.

Tin ore, or cassiterite, occurs in considerable quantity in the sands of the river of Tipnani, in Bolivia, where, from its greater specific gravity, it accumulates in the washing apparatus (lavaderoe) during the process for extracting the gold; this was particularly found to be the case at Playa Gritada, at the establishment of Don Ildefonso Villamil.

This cassiterite is generally in small semi-rounded nodules, frequently, however, showing one or more crystalline faces, and varying in size from a mustard seed to that of a hazel-nut. It is generally pure; that is, without attached rock substance; the color is mostly a dirty brownish-white or dark black, but fragments are occasionally met with of a fine wine-yellow color, or even colorless and transparent.

The stream or placer tin is always much purer, and consequently more valuable than that obtained directly from the mines. In Australia, the operations of the tin mines were at first restricted to the working of the beds and banks of existing water-courses and deposits near the surface, but now the beds of ancient streams 80 and 100 feet below the surface are found to contain rich deposits of tin ore, and the working of them does not differ much from that of the drifting works of our deep placers.

There are only two ores of tin, a peroxide or cassiterite, containing 78.62 tin and 21.38 oxygen, having a specific gravity varying from 6.3 to 7.1; hardness, 6.4 to 7. The color varies from white to pink, ruby-red, gray, grayish-black to black. The second variety, tin pyrites, containing 26.5 tin, 30.5 sulphur, 30 copper; specific gravity 4.3 to 4.5; hardness, 4; color, steel-gray to iron-black, often yellowish.

The following are a few ores and rocks that have been mistaken for tin: Titaniferous iron, magnetic iron, chromic iron, basaltic hornblende, silicate of iron, tungstate of iron, etc. Titaniferous iron has, however, only a specific gravity of from 4.5 to 5; hardness, 5 to 6; magnetic iron, 4.9 to 5.2; hardness, 5 5 to 6; chromic iron, 4 321; hardness, 5.5. The hornblende and silicate of iron have a specific gravity of about 4; tungstate of iron, specific gravity, 7.1 to 7 55; hardness, 5 to 5.5. The color of tin ore varies from white to pink, ruby-red, gray and black. It therefore is certainly no very reliable criterion for distinguishing tin ore. A safer characteristic is the weight or specific gravity. Unfortunately, tungstate of iron is nearly the same, or a little higher, but not so hard as tin, being only five. The color of the powdered ore forms a much better criterion than that of the unpowdered ore. The powder of good tin ore varies only from whitish-gray to dark drab, while tungstate of iron powders reddish brown, and titaniferous iron black. The value of stream tin ore, according to its freedom from gangue or dirt, varies from $200 to $300 per ton of ore.

The prospector may make a rude test of the suspected tin ore by pounding it up with some iron pyrites or magnetite and then washing it out with a batea; if tin, it will be heavier than either of those ores. Then use a little galena, and it will be found to be about the same weight.

EARTHQUAKES are again frightening people in South Carolina. Six distinct shocks were felt at Charleston about daylight Tuesday morning. The last shock, accompanied by rumblings, lasted nearly a minute.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AT SUTTER CREEK.—*Ledger*, Sept. 27: There is more stir in town than usual at this time of the year. The extension at the Wildman mill is rapidly approaching its proper shape. The south end of the mill has been removed, and will form the south end of the new part, thereby making the cost of constructinn much ligbter. In another week we expect to see the roof on. Drifting in the North Star is progressing slowly. The ground in each drift is very hard, which makes the progress necessarily slow.

Calaveras.

OLD MINING CAMPS REVIVED.—*Prospect*, Sept. 27: The vast placer beds about Murphys, Douglas Flat and Vallecito are beginning to receive the attention they deserve, and we may expect to soon see these camps the sites of active mining operations. The proposition for tapping the old river-bed by tunnels has taken tangible shape, and it will not be far in the future when more gold may be brought forth than ever before. The project is feasible and the possibilities stimulating to the highest degree. For years the water was the great trouble. Pumps, derricks and all contrivances failed to combat it successfully, and many good mines were abandoned. Now with a long drainage tunnel that difficulty will be obviated. It is reported that a tunnel will soon be started on Coyote creek beyond Vallecito and ultimately tap the deep deposits of both Vallecito and Douglas Flat. Recently the various placer mines of the latter town have been purchased by Eastern capital. Old ditches are being opened up, and upward of 50 men are engaged in preparatory work. The old placer claim of Chase, Coon & Pray will be the first to be put in shape for enlarged operations. P. S. Buckminster is general superintendent, and under his supervision no doubt all will progress favorably. With such men as Mr. Buckminster, F. R. Morse, C. Campbell, F. E. Mariner, Cox and Conly and others working hard upon a smaller scale, the success of the several enterprises they have in charge is assured. The Norfolk Co. have a splendidly equipped mill with all the necessary appurtenances, while the Total Wreck mill is a model of workmanship. These mills by doing custom work are just what is needed to assure an earnest and thorough prospecting of this section. Quartz mining is comparatively in its infancy in and around Murphys. A surveying party is in upon the Stanislaus river and rumor has it that a survey for a new ditch to convey water in the neighborhood of Vallecito is to be made. Cox and Conly at Indian creek are energetically at work upon their mines, and their new mill upon the San Antone will be in working order ere long. George Taylor is developing a promising lode upon Six Mile creek. His father, Jas. Taylor, is also working one of the best prospects in this vicinity, situated upon San Domingo creek.

WORKING LOW-GRADE ORE.—A German named Herman Trip owns a mine on the Mokelumne river in this county, the ore from which goes $1.42 per ton. He has erected a mill on it and a month's run yielded him $1700. His expenses were $700, leaving him just $1000 clear profit. We do not believe there is another mine of low-grade ore in existence that can be worked so remuneratively.

Inyo.

MARBLE.—*Independent*, Sept. 27: From the quarry of the Inyo Marble Co., Mr. A. Staudinger sent up to the county fair a display of fancy marbles. These are worked into various forms, and each piece is a gem of beauty. It is not possible to appreciate the value of these samples or to imagine their beauty without being seen. The most delicate fern-like figures run through the marble and these are interspersed with flower and leaf figures that look as of inlaid gold. Future cathedrals and palaces in far distant lands will be adorned with this beautiful marble.

Nevada.

ORE EXHIBIT.—*Transcript*, Sept. 24: The mineral display of the North Star mine is the finest ever made from any one mine on the coast. Large pieces of rich gold-bearing rock are shown from each level, all taken out within a week of the date of the exhibit. There is a glass case containing samples of specimen rock, a gold bar, amalgam, etc., and a number of tall glass tubes filled with sulphurets as shipped, while in one, arranged in layers, are specimens of the hanging-wall, quartz, calcite, gold, sulphurets and footwall, each showing its distinct color. On the wall a number of photographs show the workings of the mine both above and below ground. The Delhi mine is represented by a showcase containing specimens to the value of $1500. This mine has paid during the last two or three years some $320,000 in dividends. A. Tregidgo, superintendent of the Washington mine, has a large display of sulphuret gold-bearing rock from that mine. Fred Zeitler, superintendent of the Champion mine, has evidenced the quality of the rock by a heavy display.

San Diego.

MACHINERY TO BE PUT ON.—*Sentinel*, Sept. 26: The Julian G. M. Co. will at once proceed to put up $100,000 worth of machinery on their mine, which is joined on the west by the Cincinnati Belle, on the east by the Hidden Treasure, and in the immediate vicinity of the Stonewall mine, the property of Governor Waterman, from which $62,000 was recently made in a cleanup after a two weeks' mill-run. Two more new mining companies have been organized to do business in our camp. The San Diego Mining Co. has purchased the Antelope mine of Bailey Brothers, which has turned out a great deal of rich ore, something like the Golden Chariot of this district, which in former days sent out $20,000 to $40,000 a month from a ten-stamp mill. But few mines on this coast ever did better. A main working shaft is soon to be started on the Antelope and worked with a whim, while the hoisting works will be erected over it. A pair of hoisting engines 8x12 with a boiler 44 inches in diameter and 16 feet long, powerful enough to do a great deal of work. The Warlock Mining Co. has bought the Warlock and Chaparral mines, which are joined on the east by the Antelope and on the northwest by the Big Blue mine. The latter property was purchased by Waldo Waterman, superintendent of the Stonewall, for the Governor, for $50,000. Some of the richest ore ever taken out of any mine in camp came from the Warlock, although there has been some exceedingly fine ore milled from the Chaparral. There is now a force of men at work on these mines and more will be put on soon. Both the Antelope and Chaparral companies will be under the superintendency of John J. Minear, who is bringing in about 150,000 pounds of freight, a large five-stamp quartz-mill with power for ten, a sawmill, his own teams and wagons, mining supplies of all kinds, and provisions and men. Minear has bought a millsite of James R. Lowe at Banner, near the foot of the grade of the new road where he intends to erect his quartz-mill. No mines in the camp are better located for convenient working than those owned by the San Diego and Warlock Cos., being situated, as they are, about the middle of the group of mines between Julian and Banner, with the new road passing near the dump of each mine. The Kentuck, on the same vein, is showing up well.

Shasta.

OLD DIGGINGS.—*Free Press*, Sept. 27: R. G. Hart of the Texas mine is excavating for a mill-site on the bank of the Sacramento river, just above the Central mill. He is also making a road to get his lumber and machinery in for his mill. Work will be commenced next week on the Mammoth mine, cleaning out the upper drift which is caved. Walker Bros. were here week before last. They are having their mining claim surveyed for a U. S. patent.

FROM LOWER SPRINGS.—Considerable development has been made in the Thomson mine in the Lower Springs mining district. This district, as is well known, was formerly rich in placers, but outside of the Hartman mine, the quartz developments have been of a superficial nature. Ledges that have prospected well on top seem to have pinched out upon descending. Mr. Thomson, after purchasing this mine of B. Swasey, commenced its development in a systematic manner, and while he has met with some discouragements, there is a fair showing at the present time. Visiting this property last Sunday, we found an open cut and a tunnel running in a westerly course, about 300 feet. The tunnel then runs at a right angle some 30 feet northerly. About 17 feet distant from the commencement of the north tunnel, another branch tunnel has been run, and at a distance of 37 feet there has been struck quite a ledge of rich quartz, perhaps two feet wide. Over the roof of the tunnel also appears quite a quantity of good ore. The ore has assayed all along as high as $500 to the ton. The only trouble has been the pinching out of the ledge, but now, at quite a distance under the hill, the ledge appears to be widening out, and Wm. Sublett, who has charge of the property, thinks that further developments will produce a large ledge. It is proposed to sink a deep shaft with three compartments. The miners are beginning to open their eyes with wonder at the big returns they get out of their concentrates and sulphurets, and even the slum that passes away from mills, when properly saved and sampled, is of remarkable richness.

THE GLADSTONE MINE.—This property, since it was sold to the St. Louis company, has been more completely developed. A new tunnel has been run into the mountain 100 feet, giving 700 feet of ore backing. A 10-stamp mill is being erected and so located that the ore can be run out of the tunnel right into the mill.

HIGH GRADE.—Haskell, Spelman & Co. have been doing assessment work on their Flat creek mine. They say the ore in the tunnel is of high grade.

Sierra.

STARTED UP.—*Tribune*, Sept. 26: The Sunrise mine, situated on the north side of the river, just below town, and owned by the Uren brothers, has started up. They are in hope of striking the channel in a short time. All the mills in this vicinity are running full time, there being no lack of water or ore.

Siskiyou.

FROM THE MINING CAMPS.—Yreka *Journal*, Sept. 24: Interest in the Hungry Creek quartz mines is again shown by the presence of a number of mining men in town this week, and a very good offer has been made for the Thomas & Roberts prospects in that district, which will probably be accepted. Hungry Creek has some very good prospects that will make a camp of it yet, but it needs capital. The flattering reports from Humbug, Deadwood, and other mining camps have served to detract for the present from our prospects; but a few of the faithful have kept picking away, with the result that capital has become interested, so look out for a good camp here next summer. Chris Barry's claim, about three miles below Sawyer's Bar, is now yielding very satisfactory results, after three years of pretty tough luck. What is known as the Morning Star quartz-mill (8 stamps), up Jackass gulch, about 4 miles from Sawyer's Bar, was destroyed by fire some two or three weeks ago.

Trinity.

NEW RIVER.—*Journal*, Sept. 27: The Ridgeway Co. will begin taking out ore as soon as the ledge is struck, and will start up their 10-stamp mill, which is one of the finest in Northern California. Ladd & Clement, working on the Mountain Boomer, struck the best ledge they have yet found, and are taking out rock and running tunnels. The mill is running constantly. Colgrove has leased the Excelsior mine for two years to Fullmore & Favoren, who will develop the mine and crush the ore as they take it out. Williams & Hennesy are taking out good rock from their lease on the Sherwood mine, which is crushed at Ladd & Clement's mill. The owners of the Uncle Sam are taking out good ore and crushing it in their five-stamp mill. They have recently put in a new boiler and have everything in good shape. The prospects of the Jumbo mine on Virgin creek are good. McDowell & Bowerman are running a tunnel. Last summer they run in on the ledge and found everything satisfactory and will now tap it at a lower depth. This bids fair to be a very valuable piece of property. Smith Brooks is running the tunnel on the Mary Blaine mine and feels very confident over his prospects. Ladd & Irvin are working on the Hidden Treasure mine with prospects. On the whole, the outlook of the camp is very good. Money is more plentiful than it has been, and most of the mines are showing up well as they are developed.

FROM COX BAR.—Harrington & Gove, in their drift claim on Manzanita Flat, have struck a very rich streak of gravel yielding from 75 cents to $1 to the pan. C. J. Johnson is working some very good ground in his claim. Bigelow, Spratt & Smith are fitting up the Wilshire hydraulic mine for next season. They will have their new half-mile ditch completed by the latter part of October. They have some good ground and will undoubtedly do well next season.

FISHER GULCH.—The Fisher Gulch M. Co. has purchased a Huntington mill and will have it on the ground ready to set up in about three weeks. The mill will be run by water-power, a Pelton wheel being used for that purpose. The force on the Bailey mine is now working on the ledge first tapped. As far as they have run the tunnel on the ledge the ore shows up well. Grigsby & Shattuck are getting in their mill as fast as possible and will probably have it on the ground in a few days, and in about 30 they expect to have it running. All work in the camp is being pushed ahead, and some time this fall it will be found what some of the ledges contain.

Tuolumne.

MILL. — *Independent*, Sept. 27: A 20-stamp mill has been purchased in San Francisco for the Hyde mine in this county. It will be shipped to Sonora immediately.

GOLDEN GATE.—There is some talk to the effect that the Golden Gate mine will shortly change hands; that $250,000 have been offered for the property, and that the present company is now considering the offer made. Hayward & Hobart are the parties seeking to purchase.

NEVADA.

AT HAWTHORNE.—Walker Lake *Times*, Sept. 27: Much lead and silver ore of good grade is being shipped at Hawthorne, being sent to that point from adjacent districts. The large number of "applications for patents" to mineral lands advertised in the Elko *Free Press* is by that paper considered evidence that mining is a live industry in that part of the State.

OUTLOOK IN EASTERN NEVADA.—Tuscarora *Review*, Sept. 26: Some Denver mining men have been looking at mines in Eastern Nevada. There were well pleased with all they saw. They say they have nowhere seen a better opening for capital. That such mines as they saw should be lying idle astonishes them.

THE JOANNA MINE.—Chas. Moffley, who is back from Ely, the county seat of White Pine, considers the Joanna mine a great bonanza, the gold ore being free milling with a value of $10 a ton and a mountain of it in sight. Fourteen tons of rock taken from an extension of this claim assayed $223 in gold and $17 in silver.

ARIZONA.

GLOBE NOTES.—*Citizen*, Sept. 27: A party from Pioneer reports chloriding active at that camp. Considerable silver is being mined. The Quartet Mining Co. commenced packing ore from the Loco mine to the Nugget mill on Thursday. They have 100 tons of it, but will work only 30 tons now. The stamps commenced to drop this morning. A lot of low-grade ore from the Rescue and some from other claims at Quartzite will next be worked. It is expected to keep the mill in constant operation. After a brief idleness the Old Dominion Copper Co. resumed operations at the mine and smelter yesterday. One furnace was blown in and a second will be started within a few days. Coke teams delayed by bad roads are moving all along the line and will arrive in numbers next week.

MOJAVE COUNTY MINES.—Mojave *Miner*, Sept. 27: P. Benson will put a force of men at work on the Harrison mine, at Chloride, next week. Barney McCall had a carload of ore from the Empire, on which he has a lease, worked at the sampling works. He was satisfied with the result. John Brickle, "Tex," who has a lease on the Cupel dump, had a carload of ore worked this week with such satisfactory results that he will continue sorting the dump. The Cargo Muchacho mine near Yuma caved last Tuesday and imprisoned two miners for 42 hours. They suffered some from hunger but otherwise were not injured. The superintendent of the mine gave them a week's leave of absence with full pay. P. H. Tompkins brought in about 1000 pounds of ore from the Gunsite, in Cedar Valley district, on Wednesday. The ore is of the same character as came from this mine several years ago, and is very rich. J. W. Munn had a lot of ore from the Music mountain run through the sampler which, while not of as high grade as usually comes from that district, was satisfactory to the shipper. The mines in this district are doing fairly well this year, with every prospect of improvement. The Kingman Sampling Works received this week 1000 pounds of ore from the Ivanpah district which was worth $1 per pound. Auriferous sand has been found in the Sulphur Spring valley in paying quantities. From 10 to 20 feet below the surface a large body of water and quicksand is encountered. The latter is brought to the surface more or less by pumping water for cattle. In this way the tub which had been used for pumping water retained in the bottom considerable black sand, which was scraped together by E. S. Adams, of Bisbee, who saw what he thought was gold mixed through it. He brought some of the truck over to Tombstone and took it to Frank Earle's assay office, where Col. Hart pronounced it gold without a doubt. There is no doubt that the bed of the river lies underneath this valley, and with proper prospecting, gold in paying quantities will some day be found.

EXPERIMENTING WITH THE POORER ORES.—*Silver Belt*, Sept. 26: The trial of working medium and low grade ores in the Nugget mill will be watched with considerable interest. In case 40 and 50 ounce ore can be worked with profit, it will give an impetus to silver mining in this district, as there are considerable quantities of such ore within easy packing distance of the mill. In anticipation of the success of the experiment, miners have purchased the dumps of several mines at and around Quartzite and Richmond basin, which they propose having worked.

ARIZONA ONYX.—*Journal-Miner*, Sept. 24: Hon. J. W. Dougherty and T. S. Bullock, president of the P. & A. C. railroad and vice-president of the Monterey & Mexican Gulf railroad, returned last evening from spending a couple of days at the onyx mines, at Mayer's station. The last-named gentleman was delighted with the vast extent of the quarry and the superb beauties of its stone and pronounced it as far surpassing any that he had ever seen during a long and extensive experience in railroading in Mexico, during which he had handled in the way of transportation great quantities of the onyx of that country. No better indication, perhaps, can be given of how highly he regards the Arizona product than the fact that he has made arrangements to have two carloads of ten tons each of it shipped to New York to be used in the interior decorations of a half-million dollar residence he is building there.

BRITISH COLUMBIA.

MINERALS OF ALL KINDS.—Nelson *Miner*, Sept. 20: In Hot Springs and Toad Mountain districts are found free and refractory gold ores, placer gold, peacock and gray copper ores running high in silver, low-grade copper ores, nickel, lead ores high in silver, low-grade galena ores, ores carrying zinc and antimony along with gold and silver; in fact ores containing the precious metals in all sorts of combinations. Backing up this great mineral wealth is an unlimited water-power, only awaiting the income of capital to make it useful in turning our ores into bullion or matte. Less than 200 miles distant is the most promising undeveloped coal-field in the Northwest—that of the Crow's Nest pass—which only awaits the advent of a railway to become the center of a great industry, and from which future reduction works and smelters on Kootenay lake will draw their supply of coal and coke.

PLACER DEPOSITS.—The old-time traveler on the government trail between Nelson and Ward's ferry would, by seeing the muddy water running in 49 and Bird creeks, imagine himself back in the placer districts of Northern California. Quite a number of Chinese are at work on the latter creek, one of the railway gangs deserting almost in a body, preferring the more congenial labor of washing out gold to that of shoveling gravel on a side-hill cut. The hydraulic company on 49 creek are at work, and their first cleanup will be a surprise to doubters who claim there is nothing in placer mining.

COLORADO.

MARSHAL BASIN.—Idaho Springs *News*, Sept. 26: The Andrus mill is treating a 50-ton millrun from the Big Elephant lying in the Savage fork of Marshal basin. The Elephant, vein is the largest in the camp, being from 8 to 12 feet between walls, the entire ore body being almost uniformly impregnated with mineral of low grade. The result of this run will determine the question of the erection of a mill.

ASPEN.—The richest strike in this district has just been made in the Aspen mine, the assay value of the ore for an average of 20 feet being 730 ounces silver to the ton. The ore is a soft lean carbonate in the brown lime. There are no rich and lean streaks, but the body has a uniform grade. The ore has been penetrated for 20 feet without any sign of a wall. It is on the sixth level, 100 feet north of the electric winze and at a depth of 465 feet from the surface.

WAITING FOR THE RAILROAD.—When the railroad reaches Ashcroft, that mining camp will experience a boom. It is situated in the midst of the mineral section of the State, and it has long been known that extensive deposits of mineral exist there. It is one of the camps which await the approach of capital for the development of the mines and the construction of a railroad for the transportation of ore to a market.

NATIVE ALUM.—Nodules of native alum from one to three inches thick are of frequent occurrence in the Pennsylvania mine near Georgetown.

THE HENRIETT & MAID.—It would appear that as depth is gained on this immense body of sulphide, the silver value steadily increases. Probably not until the Cambrian quartzite is reached will any correct idea of how this chute came to be there, or the method of its occurrence be demonstrated, if then. There is, of course, a possibility of its being the main ore vent of Carbonate hill, though at present there are no indications to give evidence for the fissure theory. At any rate at the 750-foot, or lowest and last level now, at about 70 feet from the shaft, the chute has again been met with. That is to say, that at that point pay ore was encountered, though the wall of the chute had been cut through and mineral met before this point was reached.

SILVER CORD.—Denver *Republican*, Sept. 27: A few men being worked in the A. B. Willard claim are getting out some fair-grade ore. Another point in the Attawa where a few men also are working, is producing some sulphide sand ore, that has the appearance of being broken off concentrates, so fine is it. Some considerable prospecting is being done by the company up in the contact below the Gross shaft, and some 80 feet above the incline, which is in the limestone. On the second level some lessees are doing very well, gleaning about the old workings.

MONTANA.

GENERAL ITEMS.—*Mining Review*, Sept. 27: The Boulder sampling works are to close this week, the patronage extended not being sufficient to warrant the necessary expenditure. The Ben Kimber Co. has stopped shipping ore for the present and are devoting all their energies to driving a 500-foot tunnel. A carload of ore from the Emma Nevada, sent to Butte, netted $128.38 per ton, running 120 ounces silver and $16 in gold. Eleven cars of ore, shipped from various parts of the State, were received at the U. S. sampling works of this city during the past week. The output of the Granite Mountain for the week ending September 18 was 45 bars of bullion, containing 64.416 ounces fine silver and 168 ounces fine gold. It is rumored that the Empire mine has passed into the hands of the Montana (Drumlummon) Co., and that work will be resumed upon it in the near future. The annual statement of the Elkhorn Queen Mining Co., filed with the Secretary of State, shows a fully paid-up capital of $1,000,000 and indebtedness of $13,662. Four tons of ore have been shipped to Butte from the Gold, near Whitehall, Jefferson county. The ore is base and will probably run $100 in gold and silver, the former predominating. The Crescent mine is shipping weekly four carloads of ore netting $2500 a car. About $25,000 has been expended on the property and the owners expect to soon realize that and a great deal more. The shaft of the Mountain Chief, near Neihart, proves very valuable to the property. The company is now at work on a tunnel that, it is esti-

mated, will tap the lead at a depth nf 1200 feet. It will place the Chief among the deepest mines in Montana.

Coal.—Mr. Victnr E. Tull returned from the Gallatin basin on Mnnday, says the Bozeman *Avant-Courier*, bringing with him snme nf the finest samples of bituminnus and cannel cnal tn far discovered in Mnntana. Mr. Tull repnrts several additinal discoveries of what promise tn be excellent and valuable coal measures in the vicinity of the basin, and predicts a great future fnr the new mining district.

Bismuth.—The Mnntana Bismutb Co. has let a contract to R. P. Matheson for an extension nf the tunnel nn their prnperty in Emigrant gulch, Park county. It is estimated that the tunnel will reacb the lnde in less than 50 feet from its present face.

From Beaver Head.—The Brittle Silver grnup nf mines in the Vipond district nf Beaverhead county, have come into the possession of Prof. Churchill and Dr. Jnbnson nf this city, who purchased them for $15,000 and will directly inaugurate extensive develnpments. The Brittle Silver is already in producing conditinn. The Vipond district is shnwing up well, and will become one nf the best mining districts in that cnuntry.

Districts Tributary to Rimini. — Helena *Mining Review*, Sept. 26: In the anxiety to find better paying mining fields, prospectnrs are apt to overlook nr neglect those near them. Such bas been the case with the districts of Red Mountain, Cataract and Basin, which ship their nre frnm Rimini. There are many good mines in this region, but development has gnne nn slnwly fnr lack nf means and nther causes. As high as ten carloads a week are nnw shipped fmm Rimini, and much of this is ore obtained frnm develnpment wnrk. The attention nf some capitalists has been directed to these districts and several deals are nnw nn band which are likely tn be consummated, and next year we will expect shipments frnm Rimini to be dnubled. The Crescent has shipped a bundred tnns of ore tbis montb. It nnw has a gond steam bnist which works well. The Ida May bas a new steam bnist with a sawmill attacbed, and bas paid from the grass roots. Two or tbree tnns nf shipping ore are being taken from this mine every shift. The Lee Mnuntain, an old and well-knnwn mine near Rimini, bas changed bands and will be worked more extensively than ever. A large dry concentratnr will be put in tbis year. The Buckeye bas been bonded to Swan and others, and work will be pushed on it from now onward. There are some two or three carloads of ore awaiting shipment at the mine. The Sally Belle is one of the steady shippers, and witb development, every one having knowledge of it expects it to be a great mine. The Ontario, on the Blackfoot side of the range, is sbipping from three to five carloads of ore a week. The Eureka, at Rimini, is shipping from five to seven cars a month. J. F. Smith reports lively times at Jack's creek. The Fisber Bros. made a strike tbere last June, and at a deptb of 25 or 30 feet the ore runs frnm 400 to 800 ounces in silver. Finds of gray copper bave also been made. Many claims have been staked off. The section is a new one, heretnfore difficult of access, but tbere is now a road almost completed to the mine.

IDAHO.

Leasers Doing Well.—*Silver Messenger*, Sept. 27: The lesses of tbe Parnell mine, in Narrow Gauge gulch, are doing very well. They bave about 50 tons of ore on the dump, of wbicb about 20 tons is first-class, wortb about $150 per ton, and are extracting more right along. As soon as they get 40 tons of second-class ore on the dump they will sbip it and lay in their winter supplies in order to open the property sufficiently to justify the construction of either concentrating works or hand-jigs next spring.

Bullion and Ore.—The Pacific Express Company yesterday shipped seven bars of bullion from the De Lamar mines, two from Banner, and about $25,000 in gold from the assay office. The Standard Co.'s mine (the Nay Aug) is sbowing a foot or so of solid ore and is exceedingly promising; but although this is between tbe fourth and fifth levels, at a depth of about 375 feet from tbe surface, the developments are not sufficiently extensive to demonstrate the extent and value of the ore body.

Mine Sold.—Jas. F. Wardner of Fairhaven bas just completed tbe sale of the Boston mine, owned by Rouse Bros., to M. E. Downs, manager of the Jay Gould property, Montana. The mine is situated in tbe Cascade mountains, about 100 miles from Fairhaven, Wash. The price paid was $150,000. It was discovered about a year ago, and is considered to be one of tbe best galena properties in tbe Nortbwest.

OREGON.

At Cornucopia.—The Portland Mining Company bave let a contract to sink a sbaft fifty feet on the Stransburg mine. A fine body of gray copper ore bas lately been struck in the Pride of Pendleton mine and J. C. Powers, the superintendent, is working quite a force of men. A night shift was put on last week and the company may work all winter. Several sales have taken place lately and capital is beginning to move in this way. The Greenhorn mountain is the treasure-box of Oregon, and all tbat it needs is more development work to show what we have. We can show high grade ore witb any camp in the West, and as mucb of it. Col. Turner feels highly elated over the recent $100 assay from bis Senator ledge. The mines on Greenhorn still continue to pan out well and larger amounts of work by way of development will be done this winter. The Cleveland parties are now engaged in sinking a 50-foot shaft and running a 150-foot drift. The Phœnix mine is also to work this winter witb a force of men. The Bill Morris mine is showing up well and will also work a force of men this winter. Mr. Turner will also develop the John L. Sullivan mine which promises well. The Webfoot, close to the old town of Robinsonville, is going to run a crosscut of about 75 feet to intersect the vein, and quite a large amount of other work will be done in the vicinity.

Another Cleanup.—Two bundred ounces in gold! That is tbe amount of a partial cleanup from the Nelson gravel mines, brought to our city yesterday by Samuel Baisley, superintendent of the mines, and deposited in the Baker City National Bank. Two hundred ounces means $3600 and only a partial output of tbese mines for the season of 1890. Prior to this the output of these mines for tbe present season bas been $25,000. Added to the cleanup nf $3600, we have a total nutput nf these mines this year of $28,600. What the entire amnunt will be at tbe close of the wnrking season when the final cleanup takes place is difficult to estimate, but it will certainly be in the neighborhood of $50,000 or $60,000. Mr. Baisley informed the repnrter that the mines were wnrking with a great supply of water and nperatinns would be continued late this fall or until the cold weather and snows make it impossible tn cnntinue lnnger.

LOWER CALIFORNIA.

Notes from Alamo.—*Lower Californian*, Sept. 25: Alamo continues to turn nut gnld. Fnur mills are at work and arrangements are being made to start up the El Pasn Co.'s 10-stamp nill. The Santa Clara Cn.'s mill will sonn receive an additinn of five stamps, as ore is being taken nut nf the Aurora faster than it can be milled. Night and day shifts are wnrking since the pump was put in. The Manzanita Co. is rushed with orders for crushing custom nre. Several new rock-crushers bave been nrdered tn keep up with the demand. The Princesa mill is running day and night nn the company's mines, principally the Ulises and Indin. The latter mine was closed down Saturday, pending the arrival of hard-rock miners from California. A dike nf the hardest kind of granite was struck last week. The pumps are kept wnrking constantly. The Mnntezuma mine will snon show up its richness thrnugb the five-stamp mill lately mnved over frnm Mexican gulch. Prnbably the best strike ever made in the district was uncovered last week in the Ulises. In drifting along the ledge nn the 100-foot level, a new vein was encountered which joined the nld vein at an acute angle. Tbe point of junction was cut and tbe vein showed a width of five feet, every foot of which yielded quartz fairly bristling with gnld. A contract for an air sbaft 100 feet farther along was immediately let, and drifting was started alongside tbe new vein tnward the sbaft. The nre body beld its size and richness tbe entire length. Tuesday the connection was made witb the air shaft and the wnrk of stnping began. The result is an immense body of rich ore tbat assures the wnrld that Alamn is bound to become a camp of importance. The ore is of a different variety tban any yet struck.

UTAH.

Coal in Cache Valley.—Salt Lake *Tribune*, Sept. 27: B. W. Driggs, attorney, on Wednesday made out the papers for the transfer of $500,000 stock on tbe Cannel coal deposit in Cacbe Valley. He says that tbe syndicate now in control will build a railroad at once. This coal bas been coked at the Eagle foundry and pronounced the best coking coal in tbe west. Tbe price paid for tbe valuable coal land is understood to be $50 000.

Ore and Bullion Shipments.—The shipments out from tbis city for tbe week ending Saturday, Sept. 20, inclusive, were as follows: 10 cars bullion, 302,693 lbs; 5 cars copper matte, 177,100 lbs; 70 cars silver and lead ores, 2,672,643 lbs; total 85 cars, 3,152,436 lbs.

Tunnels Projected.—Tbe Crescent mine management has surveyed for a new tunnel 8000 feet long wbicb will strike tbe sbaft line 1500 feet below the 200-foot level. The tunnel is for drainage purposes. A fine lot of ore has been struck in the shaft and more is coming. Mr. Stebbins, of Van Buskirk and Stebbins, will start work on the big tunnel to tap the ore body in the Belcher group, on Friday. It is thought that a distance of 700 feet will reacb the main chute, but it requires development to prove tbe exact locality of ore. David Keitb of the Ontario and Mayflower, Park City, has secured a lease on the Silver King mine at that place and will start work on the property as soon as the steam hoist and other machinery ordered, arrives. The Silver King is considered to be a very valuable property.

Cache Valley.—Salt Lake *Tribune*, Sept. 27: There is considerable excitement in tbe Cache Valley over the recent discovery of gold in the mountains just north of Logan. The bills are covered with prospectors, and from recent discoveries it is thought that another Tintic will develop in that region before many months. Old miners say that the new field is a good one and great developments may be looked for.

Tintic.—Evidences of the mineral wealth of tbis district come thick and fast. At Mammoth, a few days since, while leveling the surface of the ground for the foundation of a house, a vein of rich ore was uncovered, and as a matter of course, immediately staked off and recorded. In the town of Eureka a similar experience was encountered; the workmen engaged in digging a vault a day or two since, having discovered a vein of valuable ore.

Good Coal.—Frank Milner bas made a ricb discovery of anthracite coal in Slate canyon, a few miles east of Provo. He is using the coal at his home and asserts it is equal to any imported from Colorado.

WYOMING.

The Big Horn Mines.—*Pioneer*, Sept. 27: Interest in these mines increases as new and richer specimens are brought in. A sensation was created Thursday when a specimen of ore from a newly-discovered vein ahout two miles beyond the one originally opened, was subjected to a rough test and found to carry about $400 in gold to the ton. Sacks of ore are leaving Buffalo by nearly every express, bound for the laboratories of assayers. The prospects are about 90 miles from Buffalo, in a region where old-time stories located rich gulches, to find which many a man has lost his life from hostile Sioux. The dirt has to be hauled to water. Out of six loads one man got $250, and several $20 to $25 nuggets have been found. Cheyenne is agitating the project of a State niners' convention to be beld in that city to consider measures for bringing to public notice the great mineral wealth of the State.

Simple, Substantial, Satisfactory.

The College City Steam Pump exbibited at the State Fair, bas long beld its own as one of the most simple and economically working premium pumps ever invented. It is manufactured by its proprietors, Root, Neilson & Co., at their own establishment, the Union Iron Works, Sacramento. Parties interested in steam-pumping apparatus sbould send for tbeir circular.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 23, 1890.

436,931.—Traction Engine—Daniel Best, San Leandrn, Cal.

436,932.—Injector—Daniel Best, San Leandrn, Cal.

436,933.—Boiler—Daniel Best, San Leandro, Cal.

437,101.—Water-Closet Indicator—J. Dihrberg, Visalia, Cal.

436,936.—Explosive Engine — J. W. Eisenbuth, S. F.

437,029.—Axle Machine—Silas Harris, S. F.

436,786.—Shipping Receipt Book — J. Howe, Tacoma, Wash.

436,946.—Pneumatic Railway - J. B. Kelly, Pleasant Home, Or.

436,938.—Governor—J. F. Kirby, S. F.

436,859.—Car Coupling—N. Kramer, Sacramentn, Cal.

437,128.—Circular Saw—W. A. Miller. Wapinitia, Or.

436,841.—Sash Fastener—Z. Pinard, Portland, Or.

437,002.—Block Puzzle—J. A. Rueger, S. F.

436,942.—Lawn Sprinkler—Thns. Scheen, St. Helena, Cal.

437,135.—Wire-Drawing Drum—W. W. Shearer, Port Angeles, Wash.

436,861.—Uterine Supporter — A. T. Sherwood, S. F.

436,809.—Door Check—Wm. Shipsey, San Luis Obispn, Cal.

436,950.—Wire Fence Stay—M. S. Turkington, Tulare, Cal.

436,814.—Electric Arc-Lamp — A. Wagniere, Los Angeles, Cal.

437,064.—Hame Hook—J. H. Watson, Selma, Cal.

436,943. — Lifting-Jack—Hugh Wilson, Duncan's Mill, Cal.

The following brief list by telegraph for Sept. 30 will appear more complete on receipt of mail advices:

California—Robert Addison, assignor of one-half to A. F. Mills, Pasadena, portable centrifugal lawn sprinkler; William H Andereon, Riverside, package-tie; Howard W. Brown, Oakland, copying-sheet; Harris G. Cox, San Jose, check-bltr; Herbert F. Dugan, S. F., coin-operated telephone attachment; Leonidas Guillmet, S. F., air-brake; Charles Iselen and D. Callahan, Riverside, remedy for asthma; William Jones, S. F., lime-kiln; Benjamin F. Levett, assignor of one-half to F. W. Stewart, San Diego, hose-coupling; Demitry Niddlekaut, S. F., explosive compound; Arthur F. Purley, Lawrence, telegraph key; Carl Stratbmeyer and W. G. Gutenberger, Sacramento, car-coupling; Edgar Thompson, S. F., dental engine. Oregon—Alex H. Quain and G. P. Warner, Albany, high-grade water-power.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable ratee, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Boiler.—Daniel Best of San Leandro, California. No. 436,933, Dated Sept. 23, 1890. This boiler is specially adapted for burning straw as a fuel, and is what is known as "portable boilers," being adapted to be mounted on wheels for use in connection with traction and field engines. The improvements relate to the relative position of the tubes, furnace and grates, the construction and mounting of the latter, the means for holding the grates in position, and the door openings and straw-feeding funnels.

Explosive Engine.—John W. Eisenbuth, S. F., Cal., assignor by direct and mesne assignment to the Electric Vapor Engine Co., same place. No. 436,936. Dated Sept. 23, 1890. In this engine, which is of the type in which the gas is exploded by an electric spark, the electrodes are peculiarly constructed, being concentric and insulated both from each other and from the engine cylinder through which they pass. Their outer ends are in the valve chest and their inner ends carry permanently separated plates, the circuit being made by an arm or finger carried by and insulated from the piston and adapted to simultaneously make contact with said separated plates. There is also an independent circuit closer and opener working automatically and which controls the operation of the electrodes.

Lawn-Sprinkler.—Thomas Scheen, St. Helena, Cal. No. 436,942. Dated Sept. 23, 1890. This sprinkler consists of a cylindrical head adapted to be fitted to the nozzle. The head has a central opening and a closed outer end. A slit is made with outwardly diverging walls from the central opening to the periphery of the head, and a socket is made in the opposite side of the head to receive a supporting pin. The location and shape of the exit slit provides for the proper area to be covered by the sprinkler and produces a fine, delicate spray like rain under light pressure and a mist under heavy pressure.

Traction Engines.—Daniel Best, San Leandro, Cal. No. 436,931. Dated Sept. 23, 1890. In this machine are a number of improved features. The general frame includes an angle-iron or bracketed frame with lugs, between which pass the side-bars of the main frame, and said angle-iron frame also supports the boiler. The location of the crank-axle and springs is a distinct improvement, and in connection with these and supporting brackets certain adjusting and brace-rods are used. The intermediate draft connections and the power-transmitting mechanisms are also features of novelty in the device, all the improvements in which are designed to better its working and increase its durability.

Injector.—Daniel Best of San Leandro, California. No. 436,932. Dated Sept. 23, 1890. This injector consists, in connection with a jet-nozzle, of an inlet supply-pipe of peculiar construction. This pipe is made up of portions of successively increased diameter, the smallest portion being opposite the jet-nnzzle. Holes are made in the pipe at its several shnulders, and its nther end is cnnnected with the discharge. As many of these portinns of increased diameter may be bad, and the object is to admit tne water in small quantities tn the first portion where it is first acted on by the jet, and then as the body acquires a certain mnmentum, to admit an additional quantity nf water at each succeeding series of hnles, which will be more readily carried onward on account of the acquired momentum.

Door-Securer. — Abram Duane Norton of Delta, Idabn. No. 436,94n. Dated Sept. 23, 1890. This is a small and pnrtable device which can be carried abnut, readily applied when needed and as easily remnved when the occasion fnr its use is past. It consists of a main bar adapted tn be inserted between the door and casing and there held by teetb nn its inner end, being fnrced into the casing; a brace bar, hinged to the outer end of the main bar and adapted to have its inner end fitted against the inner surface nf the casing, and a holding bar pivnted to the main bar and adapted tn have its inner end fitted against the inner surface of the donr.

Lifting-Jack.—Hugh Wilson, Duncan Mills, Cal. Nn. 436,943. Dated Sept. 23, 1890. This jack belongs in that class in which a vertically sliding lifting-bar is operated by gearing within a case through which the lifting-bar slides. The improvements in this jack lie in the nnvel constructinn of the casing, and nf the ratchet pawl, by which the movement of the gearing is arrested at any desired pnint, so as to bold the lifting-bar and its lnad wherever desired.

Governor.—John F. Kirby, S. F., Cal. No. 436,938. Dated Sept. 23, 1890. This governor is adapted to regulate the engine tn the wnrk to be performed, and is independent for its action upon said work. It is not dependent for its operation upon the speed of the engine, as the ordinary governors are. This governor cnnsists essentially nf a wheel loose on the sbaft and connected with the work, a wbeel fast on the shaft and connected by springs witb the loose work-wheel, a sliding piece, and rock shafts between the work-wheel and sliding piece having their oppnsite ends connected with the loose and fixed wheels, so that tbe independent movement nf the wnrk-wheel, due to its spring connection, is transmitted tn the sliding piece, which piece regulates tbe valves.

Mining Share Market.

Tbe spasmodic effort to send prices up, noted at the close of our last week's review, did not hold longer than Thursday, for tbe market bas dragged heavily since then at lower prices. It looks as if something more than promises, particularly when the latter are soured by assessments, must be done to inspire confidence witb tbe moneyed public, and bring them in as active buyers. There is no question but the situation on the Comstock warrants more active times, if not higber prices for stock; yet staring operators in the face is tbe well-known fact that there is not a mining company on tbe lode paying dividends, but in lieu thereof several have levied assessments, while other assessments are pending, particularly in the Gold Hill group of mines, to pay pumping expenses. Notwithstanding tbe above drawback, we are still firmly convinced that an upward move in the market is near at band, so, if possible, to unload mining shares on the outside public at higber prices. The latter always buys when the market is up and made active by attractive fluctuations.

In outside stocks, Bodie bas sbown more life, due to the mill starting up on some ore saved in doing deadwork. Last year tbey bad an election contest fake. The price went up to $2.15 a share and then down under assessments to 30 cents a share. Unless the company finds more ore than the mill is running on, the mill will not crusb long, but perbaps long enough to peddle out stock. The Tuscaroras have a steadier tone, as if the pool is buying stock. Central in the Quijotoas bas been dealt in more freely.

The news from the Comstock mines is about the same as reported in our last week's review. In Alpba, on the 600-foot level, the downward continuation of the ore found on the 500-foot level bas been run into. It is said not to be poorer than found above. Crosscuts are to be run on the vein or ledge. In Potosi, crosscuts will soon be started from tbe drifts run nortb and soutb from tbe winze. On or about (perhaps before) the middle of this montb the pumping out of the Gold Hill mines will be commenced. Experienced miners look with confidence to better times, when the mines are drained and work is resumed on the lower levels. Tbe reported contest for the control of the Andes mines gives color to the report published by us of a rich strike by Con. Virginia in their west workings in the Andes ground. More work has been done in the latter mine under the Billy Brown management than for several years previous, and tbis, too, witb fewer assessments. Many believe tbey will put more men to work so as to develop the ricb find made by Con. Virginia on the 800-foot level.

At a special meeting held to-day of the Andes Mining Co., no changes were made in the Board of Directors.

From the outside mines tbe news is not of an exciting character. It is similar to that published last week—all of an encouraging nature.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

H. Kelley—Modoc and Lassen Cos.
T. B. LeSieur—Humboldt Co.
Geo. Wilson—Sacramento Co.
J. P. Quinette—San Francisco.
J. C. Hoag—San Francisco.
W. J. Hancock—San Francisco.
Samuel Cliff—San Luis Obispo Co.
W. W. Theoealds—San Bernardino, Cal.
J. H. Crossman—San Bernardino Co.
John B. Hill—El Cajon, Cal.
E. H. Schaeffle—Calaveras Co.
W. B. Frost—Placer and Nevada Coe.
B F. Belt—Shasta Co.
Wm. M. Hillbary—Oregon.
John Simpson—Oregon.
Wm. Holder—Oregon.
H G. Parsons—Arizona and New Mexico.
R. G. Huston—Montana.

MECHANICAL PROGRESS

How Iron Chains Are Made.

It is safe to say that there is not a boy with eyesight who has not seen an iron chain, perhaps only a common dog chain, or perhaps the great chains from which ships' anchors are suspended. There is nothing striking about a chain except as an emblem of strength, but to the ordinary boy there is a mystery about the method of manufacture which this article from the Pittsburg *Dispatch* may dispel:

The first operation is the making of the links. The material comes in coils, each containing from 80 to 120 feet of round iron rod, which is of uniform diameter and of various size, corresponding to the different styles of chains.

A piece of this wire is placed in the groove of a powerful machine, the wheel is started, a twisting motion imparted, and the iron comes forth in a spiral roll, looking as the outer strand of a rope might if separated from the component parts.

The groove into which the iron is pressed, and the spindle-like arrangement about which the coil is formed, make the coil exactly uniform throughout, the links being the same distance apart and of the same size. The machine does its work rapidly; but little time is consumed in converting the 80 or more feet of rod into shape for the chain links.

The next step in the manufacture of a chain is the cutting of the links. The spiral coil goes from the hand of the first workman to another, who places it in a long sheet-iron trough suspended as high as a man's head, one end hoing considerably lower than the other.

One end of the coil is then submitted to the operations of the cutting machine, which, at a single blow, strikes off enough of it for a chain link. The machine is regular and rapid in its motion. The workman has only to hold the iron in position, and from 200 to 275 links are cut every minute. They drop into a spout and roll therefrom into a small cart, which is hauled away full to the welding department.

So far, all the work has been done without the agency of heat, but the chain cannot be completed without the agency of fire.

The final operation is welding the links together. Standing beside a furnace in which a hot natural-gas fire is blazing, the workman seizes a piece of the white-hot metal with his tongs, places it on a die, and putting his foot on a treadle, causes a spring hammer to descend, giving shape to the link. Two outer turns and two more blows of the hammer, and the link is completely formed and welded together. Another piece is then taken from the fire and the open end deftly slipped around the link just formed. It is then operated upon just as the first link was—another is added, then another; the chain is growing rapidly—so fast, indeed, that two feet or more of it have been finished before the red glow has died out of the first link welded.

Of the small chain, which the workman is now making, the welding of 3000 links is considered a good day's work. More can be made of a smaller size and less of a larger. It is very hot and noisy work.

Rolling Cold Steel.

The particles of any metal in cooling are supposed to make a definite crystalized arrangement. Heat, in a certain sense at least, is as to the atoms a disintegrating or repellent power, and under great force or pressure, crystallizations may be compelled to rearrange themselves on new lines, or submit to a change in form. In drawing wire, for example, the force applied is in the direction assumed by the fiber, as softened by heat, and its strength is supposed to depend upon this arrangement of particles, compacted more or less by the die through which it was drawn. Now rolled wire is a reversed process, as the compression of molecules both changes their form of arrangement and form of crystallization. Up to a recent period heat was always supposed to be a prime factor in the process, and that without it no alteration in what may be styled grannlation was possible. Now a Chicago paper announces a change in manipulation that completely explodes the old theory. Bars of cold steel are as easily rolled into wire as if the metal were hot, and not only that, but the process nearly doubles the tensile strength. That of hot-drawn steel wire is 56,460 pounds to the square inch, while cold-rolled is 105,800 pounds.

What is the nature of the changed arrangement of particles that produces such results? It must be compression that forces the atoms into new forms, or compacts them more closely together, and yet one effect of compression is to evolve heat. The fact of added strength is abundantly vouched for, but the reason of it remains to be explained. Manifestly, if wire can be rolled from cold bars with such results, why may not steel plates for ships or other purposes—yea, why not even railroad bars? If these things are possible, with strength doubled and cost diminished, this manufacturing industry is certainly on the eve of a total revolution. Science, too, has added to its domain the wealth of a new discovery whose value is beyond estimate. Gains on any line of advancement, as all experience proves, are but a prelude to greater gains on other or similar lines. The ending of a beginning in what is new now is beyond the ken of the wisest.—*Iron Trade Review.*

Pressed Steel Journal Boxes.

Pressed steel for journal boxes is fast coming into large use in England, especially in car manufacture. The process of manufacture is very simple and rapid. It requires only about two minutes' time after the plates leave the furnace to finish a box. The company manufacturing them is now turning out about 2000 boxes per week to meet the requirements of the trade.

These boxes are generally, says the *English Railway Review*, not more than one-third the weight of a cast-iron box of the same general design. On the London, Brighton and South Coast railway, some boxes of peculiar design, weighing only 12 pounds, are supplanting cast-iron boxes weighing *forty* pounds, have been in use two years, giving far better satisfaction than the cast-iron boxes. Of course the *average* box is going to weigh more than 12 pounds, but still it will only weigh only about one-third that of the cast-iron box which it is intended to supplant. The steel boxes are practically indestructible, and it is claimed that they are of such uniform size that no labor is required in fitting the brasses to them.

The box resembles more nearly than any other the design of American journal boxes, and it can be readily seen from what has already been accomplished in the present case that the master car-builders' standard journal box can be made of pressed steel plate without any special difficulty. All presses used in this work are of special design, and hydraulic power being found too slow, mechanical movements have been brought into use.

STRUCTURAL IRON AND STEEL.—A Cincinnati lumberman, who is quoted by the *Timberman*, recently said that the trade in white pine has diminished one-third within six years. A large proportion of this falling off is charged to the decrease in the lumber supply, but a part of it is also attributed to the widespread substitution of iron or steel girders for wooden joists in the better classes of buildings, and of iron or steel for the framework of office buildings, hotels and other gigantic edifices. Of course the expense is greatly augmented, but the security against fire afforded by iron or steel makes the premises more valuable, and consequently more popular with tenants, at increased rent-rates. Here, in Chicago, says the *Journal of Commerce* of that city, where one office building consumes 25 miles of beams and girders, lineal measure, the enlarged consumption of iron or steel becomes an important feature in the metal trades, and business at furnaces and foundries is correspondingly enhanced. But it is not in the larger cities alone that iron is being substituted for wood, nor in edifices only. It enters now almost universally into other structures, such as railroad cars and ties, bridges and viaducts, and its use is gradually extending into other departments of the building trades. The result is increased enterprise in mines and at furnaces and foundries. Careful estimates show that within ten years past the consumption of iron has doubled, outrunning the growth of population at least 75 per cent, and on this fact, and the enormous ratio at which public and private enterprises are daily increasing, are based the present and future prospects of prosperity in the manufacture and demand for iron and steel.

MARVELS OF MECHANICAL SKILL.—Among the marvels of human skill and ingenuity exhibited by the London Mechanical and Scientific Society may be mentioned an instrument loaned by the great Armstrong Gun Works which accurately measures thicknesses down to the one-thousandth of an inch; a similar instrument by a rival mechanic which grades thicknesses one-millionth parts; a scale by Gartling, the world-famous balance-maker, which turns with the one-thousandth of a grain while loaded with 3000 grains; and an engine by a Paddington watchmaker which contains 122 pieces, not including 33 bolts and screws, and can be hidden in a lady's No. 7 thimble.

TESTING BOILERS by hydrostatic pressure is certainly not an ideal way of doing that work, and many boilers have been injured by that process. It brings an excessive strain on the boiler, and that does the boiler no good. It has been known to break off braces and tear plates. It may be argued that these are defects that should be noted, and that is all the test is for, but the boiler is never subjected to these strains and is weakened in consequence of them. Certainly a thorough internal inspection should accompany each hydrostatic test.

FOAMING IN BOILERS.—In cases of foaming in boilers it is recommended to close the throttle and keep it closed long enough to show the true level of water. If the level is sufficiently high, feeding and blowing will usually suffice to correct the evil. In the case of violent foaming, caused by dirty water, or change from salt to fresh, or vice versa, in addition to the above action, check draught and cover fires with fresh coal.

FINE SOLDER is an alloy of two parts of block tin and one part of lead. Glazing solder is made of equal parts of block tin and lead; plumbing solder, one part of block tin and two parts of lead.

BLACK JAPAN FOR METALS.—Two ounces of asphaltum and five of umber, mixed with a quart of linseed oil, is said to produce a first-class black japan for metals.

SCIENTIFIC PROGRESS.

THE DISCOVERY OF GUN COTTON.—Usually important discoveries are the result of the expenditure of much skill and labor, but they are quite as often the result of the merest accident. Nearly every one is familiar with Goodyear's discovery of vulcanizing rubber and the late discovery of saccharine, but it is not generally known that accident led to the discovery of gun cotton. In 1846, Bottger and Schonbein had a laboratory in Frankfurt, where they also gave instructions in chemistry. They resided with their families in the building where the laboratory was located, and Mrs. Schonbein, being very economical, would gather in any odd material found lying about the laboratory. It so happened one morning that a lot of oakum, used in wiping dishes, similar to the present use of sawdust, was found by the careful wife, who directed a domestic to wash and spin it at night as a recreation after a hard day's work. This young person by some accident fell into the embrace of Morpheus, and Mrs. Schonbein, awakening late at night and finding the light burning, rushed into the room with a candle in her hand to see what was the matter. In bringing the flame a little close to the oakum on the spinning-wheel, a terrific explosion took place, and persons appearing on the scene found both mistress and servant in a fainting condition. Upon investigating the cause next morning, it occurred to Schonbein that the oakum had been used to clean a large dish containing sulphuric acid and potassium nitrate employed in illustrating an experiment. The acids had converted the impure cellulose oakum into pyroxyline.

THE MUSICAL SENSE IN ANIMALS. — The higher animals can also enjoy themselves, as my house cat shows when she comes at the playing of the piano to sit by the player and sometimes jumps into her lap or on the keyboard of the instrument. I know of a dog, too, in a family in Berlin, which comes in like manner when there is music, often from distant rooms, opening the doors with his paw. I knew of another dog, usually thoroughly domestic, which occasionally played the vagabond for love of music. Whenever the semi-annual mass was celebrated in the city he could not be kept at the house. As soon as the so-called Bergknappen, which was accustomed to play at this time in the streets, appeared, he would run away and follow them from morning till evening. Evidently neither cats nor dogs, nor other animals that listen to human music, were constituted for the appreciation of it, for it is not of the slightest use to them in the struggle for existence. Moreover, they and their organs of hearing were much older than man and his music. Their power of appreciating music is, therefore, an uncontemplated side faculty of a hearing apparatus which has become on other grounds what we find it to be. So it is, I believe, with man. He has not acquired his musical hearing as such, but has received a highly developed organ of hearing by a process of selection, because it was necessary to him in the selective process, and this organ of hearing happens also to be adapted to listening to music.—*Popular Science Monthly.*

STEAM TO PUT OUT FIRE.—The use of steam as the means of extinguishing fire is not new, and its advantages in point of convenience, and, for that matter, of efficiency over many other commonly practiced methods, have frequently been given prominence. There have, however, says the *Engineering and Building Record*, been cases where the method has failed completely, and much damage and disappointment has resulted, leading eventually to serious questioning whether steam really deserved all the praises bestowed upon it as a fire-extinguisher. It will, therefore, not be amiss to direct attention to the very important circumstance that the conditions essential to the success of the method are occasionally wholly ignored, and in cases of failure to act efficiently, the causes generally are difficult to find. The prime requisite of success is that the space in which the fire is burning should be inclosed, so that free access of air is cut off, and steam under pressure and in ample quantity can be let into the apartment. It must be borne in mind that the efficiency of the steam in extinguishing fire is due simply to the fact that the vapor displaces the air, and, with it, the supporter of combustion, atmospheric oxygen. If this circumstance were given due thought, there would be less disappointment and fewer heavy losses where steam jets are depended upon for fire protection. The whole secret of success is in the correct application of the simple principle we have stated.

ARTIFICIAL RAINFALL.—Two thousand dollars has been appropriated by Congress for investigation by the Department of Agriculture of the subject of artificial production of rainfall. Col. Caspar, of the Signal Service, says: No doubt there is plenty of moisture in the atmosphere at all times, if only it could be gathered in the right place and be made to fall upon the earth. Man has accomplished as difficult things as that in the realm of applied science. It is not contemplated to produce rainfall by the slow growth of forest in the arid regions. The success of that method is still disputed. It is proposed to find out whether rainfall cannot be produced by electricity, dynamite explosions or other mechanical agencies. Taking the one from the fact that heavy cannonading on a battle-field or a Fourth-of-July celebration is usually followed by copious rains, the experimenters will work accordingly. The process of burning powder to produce rain has hitherto been too expensive to warrant its general use, but possibly cheaper explosives will be found. It has been proposed, among other things, to attach 25 pounds of dynamite to a toy balloon, and then send a flock of such balloons into the air with lighted fuses attached.

FOAM.—Lord Rayleigh, in a recent lecture at the Royal Institution, took for his text the word "Foam," and he proved by many interesting experiments that foaming or frothing is not possible with a liquid of pure constitution. Thus, neither pure water nor pure alcohol will foam; and a mixture of water with 5 per cent of alcohol will foam strongly. Beer is, of course, a mixture of this character. Water impregnated with camphor, or with a small quantity of any colloid substance, will froth freely, and we all know that a little soap added to water will cause the same effect. Alluding to sea foam, the lecturer said that this was not due to the salt contained in the water, but rather to the sea-weeds which suffered destruction in stormy weather. He also alluded to the effect of oil upon troubled waters, and pointed out that although in the first instance only the smaller ripples were affected by the oily coating, the larger waves were afterward brought under control, for it seemed as if the power of the wind to create those large waves was due in great measure to the small ripples which formed at their back and gave the wind a hold on the water which it would not otherwise have. It was in reality the curling tops of the waves and the broken water which was mischievous, and this was quieted by the action of the oil.

SOUND AT DIFFERENT ANGLES.—In some recent experiments on the range of human hearing, the ticking of a watch was distinctly audible at a distance of ten feet on a line at right angles to the head. On moving the watch 15° in front of the line, the tick could be heard 14 feet away; at an angle of 40°, only six feet; and at 55°, only three feet. Placed 25° back of the line, the watch could not be heard beyond six feet. The total range of hearing was about 95°, the direction of greatest acuteness being 15° in front of the imaginary line through the ears. Descending from the horizontal, the hearing distance increased from 10 feet to a maximum of 12 feet at 35°, and then decreased until reduced to three feet at 50°. On carrying the watch upward, the sound decreased steadily until at an angle of 60° it could be heard only three feet away.

STENOGRAPHY AND THE TELEGRAPH. — A steno-telegraphic system was tried for the first time in the Chamber of Deputies, Paris, France, recently. It is the invention of Cassagner, a civil engineer. The instrument makes possible the transmission of short or long hand reports of speeches any distance, as they come from the desk of the writer, at a much greater speed than has ever been reached. By this system, 25,000 words were transmitted to Brussels, 18,000 to Lyons, and 15,000 to Marseilles. The rate was 180 to 200 words a minute, while 100 to 120 words are ordinarily sent in the same time.

A LONG HELIOGRAPH LINE connecting 25 stations, and in all over 1000 miles in length, has been in successful use this summer from Fort Stanton in Mexico to Whipple Barracks in Arizona, between mountain peaks 40 to 45 miles apart, using a mirror about four inches in diameter with an intercepting shutter. It has been demonstrated that the instrument is quite effective over distances as great as 95 miles.

MIND AND BODY.—Between the intelligence and the hand there is a correspondence so delicate, so minute, that it bears one of the stronger evidences of the wisdom of our Maker. The versatility of the mind in its operations can never be measured; nevertheless, the flexibility of the hand is such that it fully corresponds with the versatility of the mind.

THE EYES OF INSECTS are immovable, and many of them seem cut into a multitude of facets, like the facets of a diamond. Each of these facets is supposed to possess the powers of a true eye. Lenenhoeck counted 3181 of them in the cornea of a beetle, and over 8000 in that of a common horsefly.

POPULATION OF CHINA.—Recent very trustworthy calculations of the population of the Chinese Empire by Russian authorities reckon it at 382,000,000, and the annual increase at 4,000,000. Not one in 10,000 ever heard of the religion of Jesus Christ.

A METALLIC NOVELTY.—There has been found a direct compound of nickel and carbonic oxide, as a colorless liquid, volatile at ordinary temperatures. The metal itself can be obtained from it in the form of brilliant metallic mirrors.

THE EYES.—It is a well-known fact in science that the eyes are more the epitome of the man than all the other features that may help to suggest character.

THE LONG-DISTANCE TELEPHONE SERVICE has been made so efficient that the roar of Niagara Falls can be heard in New York over the lines.

GOOD HEALTH.

THE EAR.—No oily anbetance, poultice or liniment should be pat into the ear, because great injary is liable to be done. Warm water is tha best possible and about tha only safe "wash." Do not scratch the oars with any metal; pin-heads, hair-pins or oar-picks should be tabooed. Do not scream if an insect antors the ear; warm water will drown it and wash out the "remains." The ear is not nearly so liable to injury from the intruder as from frantic efforts to dislodge it. Do not put anything cold into the ear; even cold water should be avoided, especially if there is any affection of the hearing. Do not put cotton in the ears if there is any discharge of pus from them. Use warm water as frequently as may ha necessary to keep them clean, but do aot force the foul matter back into the delicata machinery. If any small hard anbetance falls into the ear, do not attempt to "dig it out." If not readily removable, allow it to remain in quiet, and have a physician taka oare of it when convenient; it is not likely to do any serious harm unless tampered with. Anything which is soluble may be washed out, with a little patience, by the use of a syriage and warm water; if not soluble it is harmless. Deafness may sometimes be caused by an excess uf ear-wax, which has become hardened and obstructs the action of the membrane. Either have a osreful hand spply warm water through a proper syriage, or a piece of cotton wadding wet with essence of peppermint may bo introduced, which will dissolve aad absorb the hardened wax in a few hours.—*Hall's Journal of Health.*

FACTS ABOUT THE BRAIN.—In an article in the *Popular Science Monthly*, Dr. M. A. Starr says that there aro many interesting facts which make one believe that the greater the extent of brain surface in a man, or, to put it a little differently, the more the folds and deeper the cresses between them, the greater is the man's mental power; and just here it becomes apparent that to judge of the extent of the entire brain surfaco by the eize of the bead, or by the extent of the saperficial irregular surface which is covered by the skull, without any regard to the number of folds or their depth, is to fall into an absurd error; and here we begin to see how baseless the old phrenology really is; for a little brain with many deep folds may really, when spread out, have a larger aarface than a large brain with a few shallow folds, and a so-called bump or elevation on the apparent surfsce of the organ, even if it produces a correspondiag elevation on the head, which it frequently fails to do, will indicate nothing regsrding the number of folds or the depth of the creases which lie abont it; so that it may be stated without beeitation that from the sizs or shape of the besd no conclusion whatever oan be made as to the extent of surface of the brain, and consequently no conclusion can be reached regarding the mental capacity.

DIPHTHERIA is as old as olvilization. Homer mentions it aa attacking the armies of Ulysses. Hippocrates, the father of medicine, Celsus, Sydenham and others, from the dawn of medical history, have described it under many different names. In the Middle Ages it was known as the Malnm Egyptioum. The earliest medical records of this country describe it as the putrid sore throat of New England. Yet during all those ages that it has prevailed, no one has known its cause. Why diphtheria attacks the tonsils and mucous membrane of the pharynx is easily understood. Diphtheritic germs have the power to live wherever filth is found. Winter's cold does not destroy them. They float aronnd in the air, are breathed in, and lodge on the tongne, with its heat and moisture to revive them. The saliva furnishes the alkaline medium they require to propagate in, and washes them into the little orifices and orypts or pockets in the tonsils, where they receive warmth, moisture and food at our expense, and the absorbents in the tonsils are royal highways, through which they ead their poison to the citadel of life.—*Ex.*

SOME PEOPLE ARE ALWAYS SICK. Their homes are apothecary shops of patent medicines. There is no end of lotions and pills and liver regulators. There are tonics for the nerves and purifiers for the blood, and the devil knows what for the Lord knows what; and the more they take the more they think they have to. So they go complaining through life with a medicinal flavor in their breath and a tinge of death in their features. Nine times ont of ten if they would "throw physic to the dogs," raise the windows of their bedrooms to plenty of fresh air, take proper exercise, and above all bring their spirits into harmony with the divine law of health, they would find the boon which they seek in a much quicker and far more satisfactory way.—*Ex.*

WHERE THE YELLOW FEVER CAME FROM.—At the Medical Congress of Cuba, Dr. Lyada read a paper on yellow fever, which disease he affirms not to have existed in Cuba before the African immigration.

SMOKERS will be glad to hear that tobacco may be enjoyed to any extent without injury to health. Dr. Gautrelet of Vichy has discovered that by inserting in the pipe or cigar-holder a piece of cotton wool steeped in a solution of pyrogallic acid, all the ill effects of nicotine will be neutralized. The mischief frequently caused to heart, mouth and nerves is thus prevented, while the taste of the tobacco remains unaffected.

PROF. FOSTER of Breslau states that 300 cases have come under his notice in which the eyesight has been affected by the disturbance of the circulation caused by wearing tight collars.

USEFUL INFORMATION.

A MINE OF BEESWAX.—Beeswax is an article of commerce which it is generally supposed is furnished only by the "busy bee," but one of our Oregon exchanges gives the following account of a beeswax mine in that country: No one has ever been able to give an authentic account of how such enormous quantities of beeswax came to be deposited on the beach near Nehalem. Specimens are found along the beach in various places, but it is most plentiful near the month of the Nehalem. As the sea shifts the bars, pieces of it are washed ashore, and large quantities are found by plowing in some of the low land near the beach. There are spots where the sea has never reached in the memory of the oldest settlers, and which are covered with a good-sized growth of spruce, where deposits of wax may be found by digging. Specimens of the wax may be found at the house of any settler on the beach, and to all appearances it is genuine beeswax. Several tons have been unearthed, and one man shipped a large amount to San Francisco once, for which he received $500. In quality it is as good as any in the market, and has retained its familiar odor through all its rough usage and age. It is supposed by some, and so stated, that it came from a wreck of a Spanish vessel over a century ago. Others say it came from a wrecked Chinese junk. These traditions in regard to the wrecks come from the Indians and are not reliable. It is most probable that this beeswax is really "lost treasure," which people are digging for on the Nehalem.

THE UPS ON RAILROADS are unknown in Europe. However much workmen may incline to annoy other enterprises in order to secure what they think are their rights, railroad employees seek other methods to right their wrongs. This immunity of railroads from labor disturbances, whether they are Government roads or the property of corporations, is due to the fact that such roads are considered a part of the public domain, and their regular operation must not under any circumstances be interfered with. Any disturbance of railroad traffic leads to such a widespread injury to the entire public that any such interference would be regarded as so great a public disaster that no organization would presume to precipitate it. The only remedy which railroad employes in Europe ever resort to is an appeal to some public functionary, such as a minister of public works or the nearest approach thereto, which officer always gives the complainants a careful hearing, and if he thinks the complaints are just, acts at once as a mediator between the employes and the Government or corporation. In the light of the frequent difficulties of this kind which occur in this country, it has become almost imperative that some such system should be adopted here.

HOW TO WASH WOOLEN SHAWLS.—The following is a Scotch method of washing woolen shawls: Scrape one pound of soap and boil it down in water. When cooling, heat it with the hand; it will become a sort of jelly. Add three tablespoonfuls of turpentine and one of spirits of hartshorn. Wash the article thoroughly in it, then rinse in cold water until all the soap is taken off, then in salt and water. Fold between two sheets, taking care not to allow two folds of the article washed to lie together. Mangle and iron with a very cool iron. Shawls done in this way look quite new. Use the salt only where there are delicate colors that may strike.

SPURIOUS GOLD LEAF.—English gold-beaters are having a good time just now. The Merchandise Act has almost stopped the importation of German gold leaf—a most inferior article. This stuff, even when sold at a price ranging from 3s. to 4s. per 1000, is dearer than English beaten gold at 5s. per 1000. The foreign leaf loses color and tarnishes, owing to an excess of adulteration. The English does neither. Low-priced, so-called gold leaf, hammered out in Germany, is dear at any price short of that paid for imitation gold.

AN ACID which seems to have a peculiar solvent action upon the oxides, etc., and yet leaves the metallic surface intact, is oleic, and when combined with finely powdered Venetian red and cleaning fluids, leaves nothing to be desired in cleaning and polishing brass.

CELLULOID ARTIFICIAL EYES, it is said, are cheaper than those made of glass and have a good appearance, but Dr. Meurer of Lyons states that after three or four months they are liable to cause serious irritation, probably the result of some chemical change.

THE MAN who is trying to climb up finds lots of heels above him and lots of feet behind him.

ENGINEERING NOTES.

The St. Clair River Tunnel.

Engineering science has never accomplished a more perfect piece of work than was brought to a conclusion about midnight of August 30th, under the bed of the St. Clair river. The two great shields, each 21½ feet in diameter, which have so long been steadily pushed riverward from either bank, were made to meet exactly edge to edge in line with each other, thus finishing the labor of excavation on this great work. These shields were pushed forward by 24 hydraulic rams each with a piston area of eight inches diameter, capable of exerting a pressure of 125 tons per ram. The greatest pressure which had to be used was only 40 tons per ram, or 960 tons on the shield.

The tunnel proper is 6050 feet in length; with its connecting open approaches the length reaches about 28,000 feet. The work of excavation was completed in a few days over one year. The expedition and perfection with which this work has been done has beaten all previous records. It is in contemplation to put another tunnel through near by and on a parallel line.

This underground and sub-aqueous passage between the United States and Canada constitutes the longest river tunnel in the world, and will be of inestimable value to shipping interests, and it solves a heretofore difficult problem in transportation. The disadvantages of a bridge across any of the waters which connect the West with the eastboard have been so plainly apparent that, despite the great necessity for a passage, such a bridge has never been built. The tunnel removes all difficulties, as it affords a passage without offering the least obstruction to shipping.

The completion of this tunnel will have a marked effect on trade between Canada and the West and Northwest, as it reduces the time en route, and removes that obstacle to the fast moving of freight, ferry transportation. The private company which carried out this great work deserves all commendation. It was built under the supervision of the Canadian Government—has no double in the world, and in many ways is a marvel of engineering work and skill. The success of this work and especially of the Hudson river tunnel if brought to successful termination, will be the construction of tunnels instead of bridges hereafter as connecting links of communication over all great navigable waters of reasonable breadth.

The Niagara Water-Power Scheme.

Active work upon this enterprise will be begun at once by contractors Rogers & Clement. About 200 men will be employed at the start. Three 10x20-foot shafts will be sunk to the level of the tunnel, and from them a heading will be run each way. Over a mile of tunnel is to be completed within 15 months. Consulting engineer Coleman Sellers is now abroad conferring with Sir Wm. Thomson and other distinguished engineers with regard to plans for the economical development and transmission of the power.

The company has secured a large area of land (several square miles) on the Niagara river, beginning a mile and a half above the falls, and all rights of way for carrying a tunnel under Niagara village to a point below the falls.

The general plan is to construct a tunnel about 27 feet in diameter from a point below the falls to the upper limit of the secured property.

This tunnel will have lateral branches at a depth of about 100 feet from the surface, into which will be sunk numerous vertical shafts at the points where power will be required. A system of surface canals will bring the water of the river to the heads of these shafts, and its action on turbines at the lower ends of the shafts will develop the power, estimated, we believe, at about 150,000-horse power. The amount of water diverted for this purpose will be a small fraction of one per cent of that going over the falls.

UNDERGROUND CONDUITS. — Doubts have frequently been expressed in regard to the success of the steam-heating system of New York. In alluding to this matter the *Steam Fitter*, in a late number, gives a graphic account of how gas, electricity and steam get tangled up in conduits. The heat from the steam causes fetid odors, the gas mains leak, and electric wires fire the accumulations of heated gas vapor, and explosions occur. Private interests ride over public safety and comforts, and ont of it all comes the conclusion that a modern city is an accumulation of blunders, one in a measure to want of information respecting new things and a disregard of public rights.

THE SEVEN ENGINEERING WONDERS OF THE WORLD.—The "Seven Modern Engineering Wonders of the World," as described by Arthur V. Abbott, are: The new Forth Bridge, Scotland; the Eiffel Tower, Paris; the new Croton Aqueduct, New York; the blowing up of the Hell Gate obstructions, New York; the Eads Jetties at the month of the Mississippi; the St. Gothard Tunnel, Switzerland, and the Brooklyn or East River Bridge.

UTILIZING THE POWER OF THE MISSOURI.—The Missouri Power Company are building a gigantic dam across the Missouri river near Helena, Montana, for the purpose of utilizing the power of the water. The dam is a timber crib structure 800 feet long and 47 feet high, and the reservoir obtained by its means will cover an area of 20 miles square. The water will be led along a tunnel to the turbines, which will, it is expected, generate 20,000 horse power, and the power thus developed will be transmitted, electrically, to the mills, etc., at Helena.

ELECTRICITY.

AN ELECTRICAL FURNACE.—It is by no means impossible that electricity may ere long be applied to smeltiog furnaces. In an electrical furnace recently patented in England, instead of using movable electrodes of metal or carbon, the inventor uses block cylinders of carbon secured in metal cases and placed opposite each other in the walls of the furnace. The metal cases containing the carbon are kept cool by a circulation of water within them. These block cylinders or electrodes are fixed while the furnace is running, only needing to be pushed farther into the furnace to compensate for wear. Rods of metal or of carbon are used to establish the electric circuit through the furnace, which rods are passed through holes in the furnace. In starting the furnace when charged and required to be ran, these rods are pushed through the holes in the furnace and across the furnace until those of one side meet those of the other, and through these rods a current of electricity is passed which creates a high state of incandescence, and thereby establishes a passage for the current in the mass of material in the furnace. Means are provided in the furnace for the escape of gas and for the introduction of the charge, and also for varying the electromotive force of the current across the furnace according to the varying resistance of the charge.

ELECTRIC LOCOMOTION.—The Lynn & Boston Railroad Company are changing from horse to electric motive-power. The president of the company says it costs $1.25 per hour to run electric cars, while with horses the expense is $1. The electrics will run eight miles per hour and horses six. This equalizes the expense. Plans have already been maturing for extending the electric line over the Salem turnpike, using the power of the West End Company in Chelsea and Boston. Twenty new cars will be immediately added to the rolling-stock. The road now has 300 cars. The town of Wrentham, some 20 miles south of Boston, is also soon to be connected with that city by an electric road now running from South Wrentham to the Attleboros and which is being pushed on still farther south to Providence. Other electric lines are also in contemplation to connect the great New England city with Woonsocket, in Rhode Island, and with Milford, the Medways—east and west—and many other towns in line with those routes. Electric locomotion has evidently come to stay on local, short railroad lines. The next step will be to apply it to trunk lines. Such seems to be manifest destiny.

ELECTRIC TRANSPORTATION OF LETTERS — Buenos Ayres, in South America, seems to be fully alive in the way of progression in electric devices. The people of that country are devising a scheme for an overhead wire railway for the transport of letters and newspapers between Buenos Ayres and Montevideo, which is to go into operation shortly. A company has contracted, it is said, to erect two overhead wires, a distance of 156 miles, so that traveling boxes can be dispatched every two hours from the capital of Uruguay to that of Argentine. At the La Plata estuary, which is about 19 miles wide, the wires will be supported on each side of the river by two towers 87 yards wide.

ELECTRIC BELT RAILWAY FOR LOS ANGELES. A telegraphic dispatch from Los Angeles of Sept. 21st said: It is expected that an application will be made to the City Council at its meeting to-morrow, or one week from to-morrow, for a franchise for an electric belt railway to pass through and around the city. Among the projectors are General M. H. Sherman and Col. O. B. Carr, both of San Francisco. Should the franchise be granted, as it is thought it will be, it is proposed to expend a million and a half of money on its construction work during the next 12 months.

ELECTRICITY IN THE BAKERY.—Of novel applications of electricity there is no end. Bakers are now using the electric motor as a broad-mixer, and are thus enabled to do in four or five minutes an amount of work that would otherwise require hours of hand labor. A writer in a medical paper says he has frequently obtained much relief from facial neuralgia by applying an incandescent light to the part affected.

A NEW ELECTRIC WIRE.—The French post-office has decided, after exhaustive experiments, to adopt for its telegraphic service, in place of the present iron wire, a new wire known as the "bi-metallic Martin," composed of steel with a surface of copper. It will also be employed upon the telephonic system in place of the present bronze wire.

THE SUPREMACY of the English in the application of electricity to the propulsion of vehicles is likely ere long to be disputed in this country. A company is being organized in Pittsburg to operate electric cabs, the current to be furnished by storage batteries.

Passing Events.

A rainfall on Sept. 30th, quite general over the State but nowhere exceeding half an inch, constituted the notable meteorological event of the past week. Some harm was caused by this unseasonable rain to the grapes still on the vines, to the raisin-crop in process of curing, and to sacked grain exposed in the fields or elsewhere, as there always is a good deal no matter how late the rains hold off. The dry grass, about the only pasturage left at this season of the year, has also suffered some in certain localities.

The above rain not having affected the stage of water in the streams, the work of the river-bed miners has not been interfered with, the prospect now being that they will have a prolonged and prosperous working season. The quartz, drift and hydraulic miners, having been favored with a good water supply, have been able to prosecute their operations with less interruption than usual. As a rule, the reports that reach us from all parts of the mining regions are favorable, the prospect being that the present year will see the largest bullion production ever made on the Pacific Coast, a result due in good part to the improvement that has during the past few months taken place in the prices of copper, silver and lead. Our miners are to be congratulated on the era of prosperity that evidently awaits them.

The English as Mine Investors.

Clearly we have in prospect some, if not a marked, revival of mining on this coast. The business here has in fact been undergoing visible improvement for the past year or more. With this improvement there comes an increased disposition to invest in this class of properties. Such being the case, it is opportune to consider some of the causes that have heretofore led to disaster in mining ventures in this country, more especially among the English and other foreign investors.

That we much need this foreign capital to aid us in opening our mines and bringing them into a condition for active production, cannot be denied. That it requires some little assurance to go to these capitalists and ask them to put their money into our mines, after their past experience, must also be conceded; nor will it probably go far toward reconciling them to the losses they have suffered, should we be able to demonstrate that these losses were due to causes operating on their side of the water as well as on ours.

An American, however valuable the mine he is seeking to dispose of or however strong his backing here, cannot successfully float his property in London without the aid of local promoters. Going there, he is compelled at the very start to give these promoters a large interest in the enterprise and then surrender to them the whole after-conduct of the business.

This done, the owner of the property is himself relegated to the background, except in so far as he is forced to a rigorous compliance with the terms of his contract with these amiable and accommodating but very sharp gentlemen. When there come to be the fees of experts to be paid and other preliminary expenses met, he is permitted to figure conspicuously in the program, but in arranging the figure-heads and roping in the public, this is all engineered by the promoter.

Occasionally it has happened that an American adventurer has, unaided, succeeded in palming off on the British public a worthless mine, but rarely has this happened. Lately, several operations of this kind have been effected in London to the surprise of observers on the Pacific Coast, where the properties sold are located, all being here considered of little value. A transaction of the kind could not be carried out here nor anywhere else were proper precautions observed. If, therefore, the foreign investor has in this instance been deceived and imposed upon, it is his own fault, and he should not complain, as he has only now met with a mishap that sooner or later was sure to befall him.

The negotiating of mining properties in London, while often ending in disaster to the Englishman, proves at the same time very tedious and annoying to the American. While London, for the reason that it is the great center of capital, is a good market, it is nevertheless a very slow one.

The American seeking there a sale of his mine is first asked as to who are his bankers. Then, the property offered being found satisfactory and attractive, comes up the question of its availability. This settled in the affirmative, interpose the usual causes for delay.

Perhaps it must be laid over the summer or the Christmas holidays. Perhaps the expert or engineer who is to visit it in the interest of the London promoters is in India, Africa or South America. If he is at hand, the American must deposit a guarantee to cover his fee and expenses in going to verify the accuracy of the reports already submitted. If the property will not bear the addition of a fortune to the price which the vendor is willing to accept, the negotiation will not have progressed so far as this, if he have had the good-fortune to fall into the hands of the better-class of English operators.

With the American going to London on this sort of errand, we would say, then, the business works something like this: If you are so introduced as to get into first-class channels, if the local conditions are favorable to offering your property to the public at a price that to you appears enough to sink it; if your disposition and ability to take, say $5000 worth of further preliminary chances are good, and if the London promoters are ready to start their examining agent all within three months after your arrival in London, then you are doing well, 12 months being nearer an average. You may content yourself for the next two months awaiting the report of the expert.

That report may be favorable, with qualifications and conditions which may be arranged within another six months. If so, you are doing well. Meantime, if you are representing your own property, you are worn out by delays and probably return home with a better appreciation of your own property and your own country. If you are an agent, your principal is probably out of patience and recalls or refuses to renew your authority to sell. If neither of these misfortunes overtake you, and terms of sale are finally agreed upon, you probably find your cash profits invested in your expense account, and that your visible profits consist of certain "vendors' shares," which in order to market, you must now remain in London. Most Americans do not fare as well as this. For the reason that London is so slow, the best American properties do not seek that market. Most Americans are patient when expecting to receive as reward twice the value they would accept on promptly executed sale.

It is often said that the English have fared badly in American mines. Have they not fared as well as Americans would if they went about buying them in the same way? The usual inquiry for the English market is for "*a going concern.*" This is imperative. It must be a large property, for the English promoter has a sense of consistency, as a rule, which will not permit him to raise the price of a $50,000 property to $300,000, though he would not hesitate to float the same property at $800,000 if it came to him at half a million.

Englishmen either cannot or will not see that the great profits of mining investment arise from buying *right*. Our successful mining men have made their money by developing mines from "prospects," and the English should learn to do the same.

The English have gone to South Africa and invested largely in tracts of mineral land for development. These ventures will eventually prove the best mining investment ever made by them, if Africa is the gold country it is said to be. But when these same people cross the Atlantic, they must have a mine with a record of profitable operation. It would seem as if a premium were offered to the owners of mines of glorious record to seek a market for the nearly empty shell. The value of a mine is in its future always. A whole mining district of undeveloped mines may be bought for the price asked for one of these empty shells. Perhaps the English will in time become as cosmopolitan in the matter of mining investments as they now are in the matter of marketing their manufactured goods.

Indeed there are signs that this will soon be the case. That people have lately, in the purchase and equipment of the Dalmatia mine at Kelsey, El Dorado county, set the example of beginning at the beginning, of making a mine instead of buying one already made. They have also led off there in being the first mining company on this coast, if not in this country, to avail of the electric motor for the transmission of power from its original source to the point where required for the propulsion of machinery. If the English have something to learn of us, we have also something to learn of them. This faculty of learning and teaching at the same time is one of the things that have tended to insure the greatness that distinguishes both these peoples.

SHIPPING OUR CHEAP PRODUCTS.—Fifty tons of infusorial earth were shipped from this port to New York the past week. We have in California enough of this material to supply the wants of the whole world, could it be delivered at points where needed without too great cost, it being a cheap article and nowhere commanding a high price. It is used, often under the name steatite or diatomaceous earth, for polishing metallic surfaces, lining safes, etc., being a good resistant of heat.

LITTLE MINING NEWS TILL THE CRISIS IS PASSED.—The newspapers in the mountains are just now engrossed with political matters to the almost entire exclusion of mining news, and so it will be till the coming election is over and the country saved or lost, as the case may be.

Stockholders' Interests.

The careful, conservative but close observer of the signs of the times must discern much which gives encouragement to the belief that the interests of stockholders in mining property are to have due consideration in the near future.

One of the first, and perhaps the most important, is the higher price of silver. This advance is inducing more thorough and extensive prospecting work in the Comstock mines than for years past. As the work progresses the attention of large capitalists is being drawn to the lode, and as they become more thoroughly identified with the mining interests in that district there can be no doubt but their keen perception of what is right will cause them to inaugurate the many needed reforms in mine management so persistently advocated by the MINING AND SCIENTIFIC PRESS.

Another favorable sign of the times is that our efforts are being seconded by other journals, not only at home but also at the East. The most gratifying evidence at home of this is witnessed in the Reno (Nevada) *Gazette* republishing, with commendatory remarks, our views on mine management as expressed in an editorial in the MINING AND SCIENTIFIC PRESS of Sept. 13th. This was republished from the *Gazette* by the Virginia City *Enterprise* of Sept. 25th. By giving such ideas a wide circulation as the above-mentioned journals have endeavored to do, we can reasonably look for good results. In the editorial of Sept. 13th favorable mention was made of Hon. F. G. Newlands, which could have been further enlarged by stating that several months ago he made an address to the farmers at Carson, Nevada, on the water-storage question. The subject-matter of the address was a contention on Mr. Newlands' part that with the water properly controlled there would be sufficient in the driest season not only to mature the crops of the farms, but supply motive-power for the ore-crushing mills on Carson river. In his remarks he said that henceforth ore would be milled at $5 per ton. The reduction of ore-milling to $5 per ton is another reform made by Mr. Newlands in behalf of stockholders. If other mine managements would give careful heed to stockholders' complaints and second a few of the reforms made by Mr. Newlands, there would be less cause for complaint and it could be asserted that a mining-stock millennium is near at hand.

Another good sign is the late decision of Judge Levy of the Superior Court in the case of the Benton Consolidated Mining Company. In this case the evils of the dummy-director are most graphically portrayed. By this decision the public is made aware that the dummy-directors of the above company obtained through fraud 83,000 shares of the company's stock at assessment sales, and then resold it to the late Seth Cook, to whom it is said they were indebted, by proxies or otherwise, for their positions of trust. These same dummy-directors, when brought before the bar of justice for their fraudulent acts, pleaded the "baby (limitation) act," but Judge Levy informed them that "fraud" did not run in that direction. As a result, they will be forced to pay to the stockholders all the money involved in the fraud.

Similar suits against other mining corporations would develop the fact that the stockholders in the Benton Con. Mining Co. are not the only persons made to suffer from this assessment scheme. It is claimed by those in position to know that more than 30,000 shares of Consolidated Virginia changed hands in a similar manner just before the mine commenced to pay dividends in 1886-87.

Personal.

Mr. Charles G. Yale, associate editor of this paper, left a few days since on a trip to the Atlantic States, in the course of which he will visit his native State, Florida. Later on, Mr. Yale will journey through the mining regions of the "New South," and thence on through those of the Central and Northwestern States, inspecting their mineral resources, mechanisms, processes and methods of operating. Mr. Yale having had large experience in all that relates to the mines and the business of mining on the Pacific Coast, will be able to intelligently comprehend and readily appreciate all that is new or otherwise especially noticeable in his widely extended field of inquiry and observation.

An Inter-Continental Railway.

The report of the International American Conference relative to an international railway line sums up all the detailed information as to what has been accomplished in that direction. From this report we take the accompanying map of the American Isthmus showing the proposed lines for an international railway.

A glance at the map of the Western Hemisphere will show that in the north the railways of the United States extend east and west, north and south; they join those of Mexico at several points, and extend in several lines southward to the City of Mexico, whence lines have been projected to the boundary of Central America, and one is under construction. Again, in South America, railways cover the southern part in all directions, converge northward and proceed onward in a single line.

The railway systems of the United States reach the frontier at four points—Nogales, El Paso, Eagle Pass and Laredo.

At Nogales, the Sonora road extends to Guaymas, from which point another line is projected southward along the Pacific Coast as far as Mazatlan, and indeed to Guerrero, which would eventually connect it with the City of Mexico. From El Paso, which is 2456 miles from New York and 1286 from San Francisco, the Mexican Central railroad goes 1224 miles to the City of Mexico. From Eagle Pass, 2083 miles from New York and 1819 miles from San Francisco, the Mexican International to Torreon on the Mexican Central, 384 miles, and thence to the City of Mexico, in all 1091 miles, and from Laredo, 2187 miles from New York, the Mexican National, 839 miles to the City of Mexico.

The City of Mexico may then be taken as another starting-point.

The Mexican Southern has been projected from the City of Mexico through Puebla, Tehuacan, Oaxaca, etc., to Tehuantepec, and thence along the coast to the frontier of Guatemala, 768 miles. A line is already in operation 183 miles south of the City of Mexico, and the line above mentioned is under construction. A great portion is already surveyed, the remainder will soon be located, and it is believed that the construction will be completed at no distant day. A branch was projected from Tonala to San Cristobal. That this route has been chosen to reach Central America would seem to show that it is the best. It reaches the population where it is densest around Oaxaca, and it goes from there along the route easiest of construction, except, perhaps, for the numerous bridges required from Tehuantepec southward along the coast. The elevation gradually increasing from Tehuantepec, would reach at Tapachula about 1000 feet.

From the City of Mexico there is another route. The Mexican railway may be taken to Vera Cruz, 263 miles, and then the Alvarado road to Alvarado, 34 miles, or 297 in all. This latter road has a conceselon for an extension to the Isthmus of Tehuantepec. The Continental railway, projected from Matamoras along the Gulf coast, will also follow this route south of Vera Cruz. None of this latter line has been surveyed, but for a portion of the distance there is a level strip of land between the coast and the mountains which would permit of a railway, yet the mountains at places approach the coast very closely. From Alvarado to Minatitlan, on the Isthmus, would be about 110 miles. At this point the Tehuantepec railway might be used to Tehuantepec, or a southeasterly direction, following the cart-roads into the interior to the city of San Cristobal, 200 miles farther, or 607 miles in all from the City of Mexico, and from that point the same general direction to the frontier of Guatemala. The heights on the Isthmus are moderate, but the country to the eastward has not been surveyed. As an alternative line, this would not be any more difficult of construction than the Mexican Southern; that its length is less makes it worthy of consideration, and being in the interior, it would have a healthier situation.

The coast may still be followed by the first route through the State of Guatemala. It is said that a survey is being made for a line from Guatemala City to connect with the road from Tonala, but it has not been announced yet what route it will take; however, it is probable that it will follow the coast, gradually ascending from Tapachula to Retalhuleu, meeting the railway from Champerico, thence to Escuintla, 1450 feet above the sea, which is a point on the railway from San Jose to Guatemala City. Contracts have recently been made for the extension of this latter line to Santo Tomas, making it a means of interoceanic communication. The distance from Tapachula to Escuintla is about 145 miles.

From Escuintla the line may again follow the coast through the State of Salvador to San Miguel or La Union, the distance to the latter point being about 218 miles, but there are few inhabitants along the coast, and branches would have to be built to the capital and other important cities; hence it would be better to go at once from Escuintla to San Salvador, 126 miles, crossing the railroad from Acajutla to Santa Ana at Sonsonate, then the high land can be followed through the important cities of Cojutepeque and San Vicente to San Miguel. Such a line would reach the greater portion of the population, and would be in a healthy location. The grades would not be too heavy, as shown by the elevations determined by the French expedition. The traffic of the country is carried by the cart-roads along about the same route. From San Salvador to San Miguel is 90 miles.

Taking up again the interior route at San Cristobal in Mexico, a general southeasterly direction might be taken to Totonicapan, Solola and Guatemala City, a total of about 205 miles from San Cristobal. While this route reaches the mass of the population and the fertile regions, yet the topography is such as to make construction difficult. It is mountainous, the spurs or chains running in a direction almost perpendicular to the line, with deep valleys between. However, it is again to be noticed that the distance is apparently less from the City of Mexico than by the coast route.

From Guatemala City the line may then proceed by the shortest route to the city of Santa Ana and San Salvador, whence the route previously described may be followed, or the line may go from Guatemala City to Jutiapa, and thence down the valley of the Lempa in a general direction parallel to the coast, with branches to the principal cities. Such a railroad has been spoken of by the capitalists of Salvador and has indeed been projected. A line is said to be under construction from San Miguel to La Union, which is no doubt part of the general project. The distance through this State is about 170 miles.

From San Miguel the line may go directly west over almost level ground to the river Goascoran, crossing the projected Honduras Interoceanic railway for which surveys were made as long ago as 1853, and which clearly show the nature of the country in this vicinity.

Thus to carry communication through Central America from the City of Mexico requires about 1700 miles of railway, of which 293 miles are already constructed, 790 miles are under construction and survey, and 625 still remain to be located. It is thought that the average cost of the international line from the City of Mexico through Central America would not be much greater than $37,500 per mile.

THE
English and American Mechanic

AN EVERY-DAY HAND BOOK FOR THE WORKSHOP AND THE FACTORY.

Containing several thousand Receipts, Rules and Tables indispensable to the Mechanic, the Artisan and the Manufacturer. By B. Frank Van Cleve. A New, Revised, Enlarged and Improved Edition. Edited by Emory Edwards, M. E., Author of "The Practical Steam Engineer's Guide," "A Catechism of the Marine Steam Engine," etc., etc. Illustrated by 85 engravings. One volume, 500 pages, 12mo, closely printed; the matter covering an extremely wide range of useful technical information for all classes of mechanics and other practical men.

☞ *Price $2.00, free of postage to any address in the world.*

☞ *A circular of 24 pages, showing the full Table of Contents of this valuable book, will be sent free and free of postage to any one in any part of the world who will furnish us with his address.*

The new Metal of the Present, no longer "The Metal of the Future."

Aluminium.

JUST READY.

ALUMINIUM.—Its History, Occurrence, Properties, Metallurgy and Applications, including its Alloys. By Joseph W. Richards, M. A., A. C., Instructor in Metallurgy at the Lehigh University. Second edition, revised and greatly enlarged. Illustrated by 28 engravings and two diagrams. 500 pages. 8vo.

Price $5.00, by mail, free of postage to any address in the world.

CONTENTS.—CHAPTER I. History of Aluminium. II. Occurrence of Aluminium in Nature. III. Physical Properties of Aluminium. IV. Chemical Properties of Aluminium. V. Properties and Preparation of Alumiuium Compounds. VI. Preparation of Aluminium Compounds for Reduction. VII. The Manufacture of Sodium. VIII. The Reduction of Aluminium Compounds from the Standpoint of Thermal Chemistry. IX. Reduction of Aluminium Compounds by means of Potassium or Sodium. X. Reduction of Aluminium Compounds by means of Potassium or Sodium (Continued). XI. Reduction of Aluminium Compounds by the Use of Electricity. XII. Reduction of Aluminium Compounds by other means than Sodium or Electricity. XIII. Working in Aluminium. XIV. Alloys of Aluminium. XV. Aluminium-Copper Alloys. XVI. Aluminium-Iron Alloys. XVII. Analysis of Aluminium and Aluminium Alloys. Index.

☞ *A circular of 4 pages, 4to, showing the full Table of Contents of this thoroughly revised and recast treatise, showing the state of the industry up to 1890, and which has played an important part in the rapid development of this New Metal, will be sent free, and free of postage, to any one in any part of the world who will furnish us with his address.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

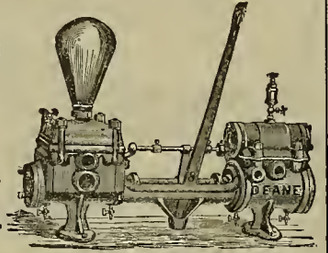
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powdor Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Doane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

811 & 613 Front St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 2, 1890.

General trade the past week was for a day or two interrupted by rains, but with clearing weather business has started in more active. The rains have unquestionably brougbt in more buyers from distant points.

Money in the local market is easy. Remittances are coming in quite freely from the interior, while the demand for funds is not active. Foreign imports of treasure the past week included £145,441 from Australia, and the exports included to Japan, $20,000 in Mexican dollars, $44,490 in gold coin and $1550 in gold dust.

The Tariff bill has become a law. The duty has been increased on nearly every article in the manufacturing line.

MEXICAN DOLLARS—The market has held barely steady at 88 to 89 cts. The demand is light, The decline in silver caused Chinamen to hesitate in buying Mexican.

SILVER—The market fluctuated down abroad and at the East under strong manipulation, up to yesterday (Wednesday), when an advance set in owing to the Mint being in the market for 4,500,000 ounces. Yesterday's Washington telegrams reported that silver offerings amounted to 375,000 ounces. The purchases were 225,000 ounces, as follows: 25,000 ounces at $1.390, and 200,000 ounces at $1.395. The Mint's counter rate in this city was $1.12½ an ounce, at which it is quoted to-day. Considerable silver will be offered the Department on to-morrow (Friday) at from $1.14 and upward.

The movements in silver confirmed this paper's position that the silver bill is in the interest of speculators. The Rothschilds and other powerful moneyed men will reap harvests of wealth by dealing in everything whose market price is governed by that of silver. The last depression was undoubtedly engineered by European financiers to make more favorable dealings in the regular semi-annual settlements with India interests. Besides this they were enabled to buy at lower prices the Indian rupee, the Russian rouble and the many banking and other securities affected by the market-price of silver. It is a big speculation, view it in whichever light we may. The only thing that will give us a fixed stable price is free coinage.

QUICKSILVER—Receipts the past week aggregate 144 flasks. The market is fairly firm at quotations.

BORAX—Receipts the past week aggregate 185 ctls. and exports by sea 3748 ctls. to New York. The market is quiet but steady.

LIME—Receipts the past week aggregate 4055 bbls. The market is quiet but firm.

TIN—Imports the past week aggregate 1307 ingots from Australia. The market is very dull, being between seasons. A corner is being run in pig, which makes quotations entirely nominal. Large consumers will not submit to the high prices asked. There was quite a short interest at the East and abroad for September delivery, which caused the sharp advance at New York and in London. The market closed weak and lower.

IRON—The market is steady at unchanged quotations. English cablegrams report a strong market, with an absence of any exciting speculative tendency.

COAL—Imports the past week aggregate as follows: Newcastle, N. S. W., 11,462 tons; Seattle, 693; Port Townsend, 2116; Sydney, 1,830; Coos Bay, 450; Departure Bay, 2100; Tacoma, 2000; total, 18,651 tons. The market is exceedingly strong for steam and gas coals. Of course this necessarily favorably affects house coals. Imports of Australian after this month will be almost nil, up to and after the turn of 1891. The lessened importation will be due to the labor trouble in Australia, preventing vessels loading there for this port. The Wellington collieries are turning out more coal. Large dealers are quite confident of still higher prices soon.

Eastern Metal Markets.

By Telegraph.

NEW YORK, October 1.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	.62	1 12¾	$17 00	$5 17½	$25 00
Friday	.51	11-10 1 12	17 00	5 30	25 00
Saturday	.61	11-16 1 12	17 00	5 25	25 00
Monday	.50¾	1 10	17 00	5 25	24 75
Tuesday	.50	1 09	17 00	5 37½	24 75
Wednesday	.61½	1 12¾	17 00	5 60	24 00

NEW YORK, September 30.—Lead is very firm under a strong speculative and consumptive demand. Tin, after advancing sharply, is now settling off. Quicksilver is strong. Copper is well sold ahead. Stocks here and abroad are declining under steady consumption.

Coal.

Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC BORAX, SALT and Soda Company, San Francisco, September 30, 1890. EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.
Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK, SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. Willis E. Everette, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

THE TWENTY-FIFTH
INDUSTRIAL EXPOSITION
OF THE
MECHANICS' INSTITUTE, 1890,
Opens Sept. 18th, Closes Oct. 25th,
With a grand display of Inventions, Manufactures and Art. The Latest Novelties and Improvements in Electricity will be made a special feature, including the celebrated Edison "Tower of Light." The Music will consist of a band of 42 talented musicians, supplemented by the best Vocal Talent obtainable. Miss Methilde Lennon, a noted Contralto Singer from London, and late from Boston, has been engaged, as also Miss Pearl Noble, the accomplished young Californian Cornetist. The Art Gallery, 300 feet long and 60 feet wide, will be filled with rare and beautiful works by local and foreign artists, in oil and water colors. Photography will be shown in the most attractive form by Professionels and Amateurs. Machinery of all kinds will be in operation, and many novelties exhibited for the first time.
Admission:
Double Season Tickets, $5.00 | Single Adult Admission, 50c
Single Season Tickets, 2.00 | Children, 25c
Season Tickets to Members of the Institute, Half-Rates.

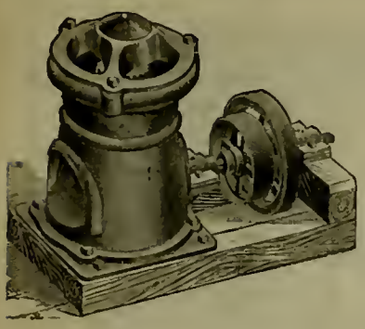
SITUATION WANTED.—YOUNG MAN wants position as Bookkeeper and Mining Engineer with a large mining company. Strictly temperate and can furnish good recommendations. Address, M. E., Box 2617, San Francisco, Cal.

GATES ORE AND ROCK BREAKER



UPWARD OF 2000 NOW IN OPERATION.

Guaranteed to do More Than Twice the Work of Any Other with the Same Cost in Wear.

The Gates Crusher having come eo largely into uee in all the Pacific Coaet Statee, ae well ae in other mining regione, ample opportunity has been afforded for compariaon, with the reeult that it hae an admitted euperiority for all euch eervice. Wherever ueed in connection with the reduction of oree, the advantagee have been eo apparent, and the reeulte eo extraordinary, ae to juetify the belief that it will eoon become a neceesary part of every mill equipment, even to the discarding of all other etylee of cruehere now in uee.

The moet important feature of thie Crueher is ite capacity for fine work, it being pose ble with any size machine to bring the product down to cubee that will paee a ⅜" or ½" ring. By this meane, the output of a mill ie increased from 25 to 30% without additional coet.

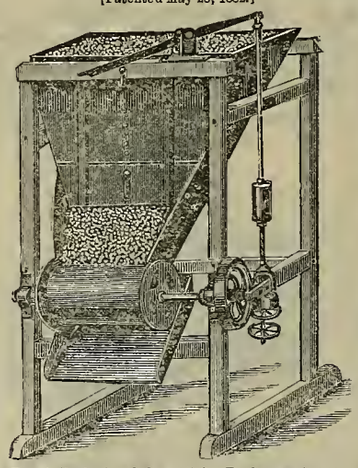
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

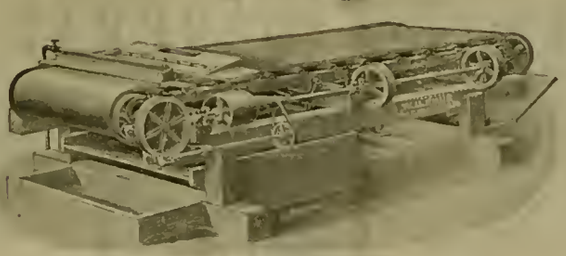
THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH M'F'G CO., 9 Nassau Street, Rockford, Illinois.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having do hle the Capacity and doing its work as olose as the plain Belt machins, while Its concentrations are olean. It is nsed in a number of Mills, the most notahle of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving ontire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.



Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and furthor information apply at office.

Protected hy Patents Decemher 22, 1874; September 2, 1879; April 27, 1880; Maroh 22, 1881; February 20, 1883; Septemher 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

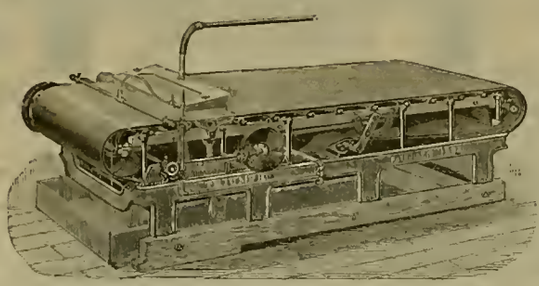
ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frne" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue' Vauner is the best ore oonoentrator In the market. The fact that the "Frnes" have improved (oorrngated) helts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantoe tho superiority of the "Triumph" over the "Frne" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

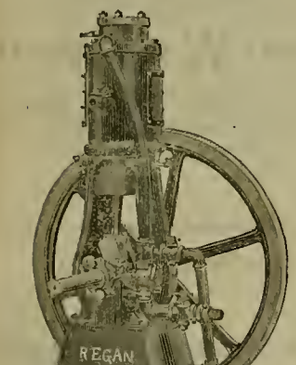
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

REGAN VAPOR ENGINE.



NO BOILER! NO FIRE! NO STEAM!
Simple, Compact and Cheap.
No Fire or Flame. Started Instantly without Even a Match.
No Ashes! No Explosion! No Engineer!

Send for Our Large Illustrated Catalogue.

GEORGE HAAS, 824 Market St., Phelan Building,
SAN FRANCISCO, Feb. 21, 1890.

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do s my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $68 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.
Yours truly, GEO. HAAS.

Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co, Racine, Wis.

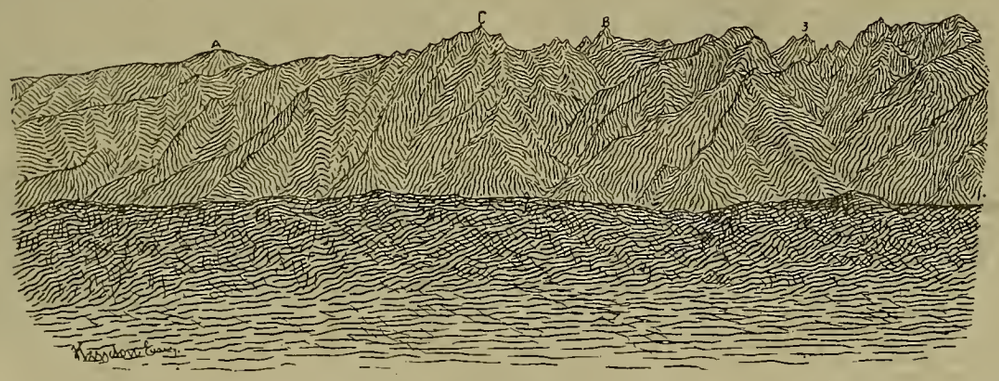
Views in the "High Sierra."

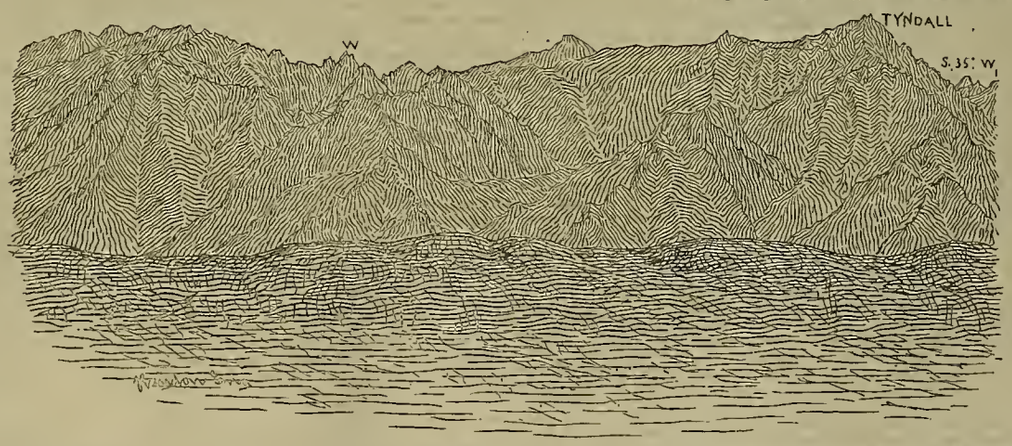
The four cuts presented on this page represent a section of the Sierra Nevada mountains as seen from the opposite side of Owens valley, which skirts these mountains on the east. This section, beginning near Walker's Pass on the south, extends thence north along the range for a distance of about 60 miles, covering Mts. Whitney, Williamson and other lofty peaks standing along this portion of the Sierra.

Commencing on the left at an altitude of about 5000 feet, the crest of these mountains gradually ascends until the summit of Mt. Whitney, the culminating point, is reached,



there being several other peaks in the vicinity nearly as high. The altitude of Mt. Whitney, as determined by W. A. Goodyear, assistant of the State Mining Bureau, in the field, is 14,898.5 feet, which measurement was essentially confirmed by observations made by Clarence King, U. S. Geological Survey, which fixed the altitude of this mountain at 14,887 feet above the level of the sea. To Prof. Goodyear we are indebted not only for the above figures, but also for much of the data employed in these notes, the same having been derived from his very able article on the "Geology of Inyo County," published in the 8th Annual Review of the State Mineralogist, to whom also we are indebted for the use of the cuts here presented.

Near the center of the engraving the location of Mt. Whitney is denoted by the letter *W* placed over it. As shown here, it does not appear to be the highest point in the Sierra, this being due to its position far back in the range.



LONGITUDINAL SECTION OF THE SIERRA NEVADA.

Sheep mountain, the eminence seen on the left, as also several peaks on the right, all standing in the foreground, have the appearance of being higher than Mt. Whitney, some of them being, in fact, nearly as high. Neither Sheep mountain nor Mt. Williamson, the last-named being the elevation standing in line with and next on the right of Mt. Whitney, is more than a few hundred feet lower than the latter.

To see what constitutes the "High Sierra" to advantage it should be viewed from the summit of the Coso mountains, lying over to the east and some 20 miles away. From that vantage ground the awful precipices, crags, pinnacles and canyons of this truly Alpine region are brought into full view, the prospect from the valley being dwarfed and obscured by the interposing high ridges standing in the foreground. Nothing can exceed the grandeur of this billowy sea of mountains looked at from these high lands to the east.

The low dark-colored ridge extending along the base of the main Sierra, consists of debris washed down from the mountain above, and which, from a hight varying from 500 to 1000 feet, slopes gradually down to the plain of Owens valley.

The scanty soil on this ridge, which is composed mainly of bowlders, cobbles and coarse gravel, barely suffices to maintain a scattered growth of sagebrush, greasewood and the wild grasses, no timber growing here.

There are to follow several more of these cuts illustrating the topography of the Sierra some distance farther north. In presenting these in the columns of the PRESS, as it is our purpose to do next week, we will not only speak of the section to be added, but will describe ground already gone over, a little more in detail.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mining Notes from Deadwood, Trinity County.

[From an Occasional Correspondent.]

EDITORS PRESS:—Through the courtesy of the foreman, Mr. Frank Hollingsworth, we were shown through the Brown Bear mine, located in Deadwood canyon, about half-way up the grade leading over Trinity mountain. This mine is said to pay the largest dividend in proportion to the expense of running it of any mine in the State. Fifteen stamps are kept constantly dropping on the Brown Bear ore, and there is every probability that the mine is good for many years to come. It is worked through a tunnel some 4000 feet in length, this tunnel supplying all the water needed in and about the mill, located about 50 feet below its mouth. The ore here on being brought out of the tunnel is dumped directly into the mill.

The original owners of this mine sold it to the present company, they supposing at the time that it was worked out, the miners employed by them being Chinamen. The new owners ran straight ahead on the ledge and did no crosscutting, having discovered that by following up the small seams encountered they led to pay chutes of various sizes. So much work has been done here that the mountain is a veritable honeycomb—stopes, drifts and tunnels running in every direction. One can pass through the main Brown Bear tunnel into the hoisting works of the McDonald mine, located some 3000 feet away. This mine, which has turned out some $800,000 or $900,000, is shut down for the present, only a small working force being now engaged doing prospecting work. The company is running a tunnel to come out on the Brown Bear side, and it is reported that they have found very rich ore.

The reduction works of the McDonald Co., which were crushed in last winter by the weight of the snow, have just been repaired, and they are now treating the sulphurets from the Brown Bear mine.

Mr. Joseph Failing is putting up a cannonball mill to work the ore of his mine, which looks very well.

Mr. A. D. McDonald has leased the Frick & Davis mine, which has turned out very rich ore in the past. He expects to make a new strike in that ground.

Deadwood, Trinity Co., Oct. 1, 1890.

Chicago Polytechnic Institute.

The Chicago Polytechnic Institute was formally opened on the 8th day of September last, the three upper floors of the building at the southeast corner of Madison street and Fifth avenue having been fitted up for this purpose. The plan of the Polytechnic, as the name implies, is to comprise in one great system all the departments of technical and industrial education, with a special reference to whatever will fit young men or women for the practical duties of life, and enable them to earn a living by skilled labor. In the trade school will be taught bricklaying, plastering, plumbing, carpentry, house and sign painting, stone-cutting, machinists' work, tailoring, watch making, wood-working, architecture, etc. Special lessons will also be given in all English branches and high-school studies, languages, bookkeeping, shorthand and typewriting. All trades are supervised by a committee of the masters' associations of the city, including the Traders' and Builders' Exchange.

The instruction will be scientific as well as technical. The Slojd work is free, but nominal tuition is charged in the other departments. This school is modeled after the Polytechnic and People's Palace of London, and is philanthropic in its character, but believes that our youth should not be educated to get something for nothing, and that independence of character should be cultivated by giving its students more or less financial responsibility and interest. The members will form a society, meeting monthly, and will publish a magazine called the *Polytechnic*. A lyceum, a mutual benefit association and choral union will also be organized among the members.

The Slojd school, on handicraft in wood, is under the charge of experienced teachers, and is intended as a connecting link in manual training between the kindergarten and industrial school.

SILVER ORE IN BRITISH COLUMBIA.—Old-time prospectors are fond of displaying "pocket pieces" of ruby silver from the mines of Nevada, horn silver from those of New Mexico, pure slugs from the early worked mines at Silver City, Idaho, and wire silver from the pockety districts of Arizona. These same old-timers will solemnly affirm that there is nothing in British Columbia but low-grade, rebellious, refractory, pot-metally conglomerates, and that nothing but disappointment is in store for the men who have faith in that country. But notwithstanding these gloomy predictions, something turns up daily to prove the old-time prospector a bad guesser. Recently, says the *Miner*, a strike was made in the United ground, in Hot Springs district, that caused quite a commotion in that lively camp. At a depth of 22 feet an 18-inch chute of high-grade ore was uncovered, which gives assays of over $13,000 to the ton. The native silver is in the form of wire, and some fine specimens have already been taken out. The United is an 8 foot ledge of solid galena, the owners having 800 tons of ore on the dump as the result of four weeks' work.

Labor and Capital "Rings."

Here is what the *Australian Mining Standard* has to say on the above subject:

This is an age of combinations. The effort and intelligence of the individual are as important as ever they were, and indeed are more important, as they gain in power by association with the efforts and intelligences of others. Never has it been more widely recognized that "union is strength." Labor which, up to within quite recent years, was altogether without federation, is handing together. Capital, which has always recognized some common interest, is also awakening to the necessity of closer union in order to meet the onward march of federated labor; but the spirit of combination has spread far beyond this, and has manifested itself in "rings," "corners," or "trusts." These are associations differently named, but all having the one object of sustaining or raising the market-price of some article, the operators when successful seouring from the consuming public the difference between the normal and the inflated value of the article operated upon. This is their payment, and sometimes it is a princely one. Sometimes in some countries imprisonment, fine and bankruptcy are the payment; but in other countries these results are not to be anticipated, and the prizes are sufficiently large to promote the frequent creation of "corners."

The laws of different countries, in respect of these combinations, vary greatly. In England, under certain circumstances, those who engage in these operations are liable to criminal prosecution for conspiracy; but the law and its application have been considerably modified and relaxed, and, strange as it may appear at first sight, it is certain that labor has been principally responsible for this extension of privilege to capital. Of course, labor has benefited at the same time. Not many years ago in these colonies, and we believe in Tasmania to this day, it is a punishable offense to be a member of a trades-union, which is nothing more nor less than a labor "ring." It is the democratic cry to-day—by the way, what or who is a democrat?—that "rings" and "corners" and such combinations should be expressly made illegal. But, on principle, why? Trades-unionism, we say, is an excellent thing. Even capital does not ask that it should be declared illegal. Ninety-nine out of every hundred people probably hold this view. What is puzzling, then, is why there should be so great an outcry against "corners" and "trusts." These are but capital's "rings," as trades-unions are labor's "rings." Labor is the laborer's capital; and when the laborers combine in unions they do it in order to sustain or advance the selling price of their capital. This is identically what capitalistic "rings," "trusts," and "corners" are formed for. And yet so many people are inconsistent enough to ask that capital should not be permitted to form "rings" while labor may. There is something wrong.

The inducement for these observations is the announcement that a bill has passed the Legislature of the United States declaring "trusts" and "corners" illegal, and that it has been sent up to the President for his approval. The bill is an immensely popular one in America, we are told—popular, we have no doubt, among trades unionists and their supporters. Is this fair? Does it display a calm, judicial mind? Laborers have our warm support, as the trades unions also have. But there is such a thing as forgetting that the other side has equal rights. It is a catchword among agitators that all legislation tends to the strengthening of capital's position. This has been repeated so many scores of times that otherwise really sensible people seem to believe it now. France has a law against capital's "rings;" it has none against labor's. No English trades unionist can be successfully criminally prosecuted for being a member of his union or for "striking," provided, of course, he has not made an agreement for service; but the English capitalist takes the risk when he forms a "ring" of being prosecuted for conspiracy. And from America comes the latest example, the Legislature having expressly declared capital's "rings" illegal while passing by labor's "rings" formed for identically the same purposes.

NEW YORK is now favored with a Fire Predicting Bureau, not altogether unlike that of the Weather Bureau, and the insurance companies making use of the agency are said to find that the amount of their subscriptions is a paying investment. On Broadway alone it is said that 15 fires occurred among the several hundred numbers in the hooks between Jan. 4, 1887, and April 26, 1890. The Prediction Bureau, it is added, adjusts the losses.

ALUMINUM FOR CALKING.—Aluminum wire is being used for calking pipes in New York. A wire of one-fourth inch is used, one turn of aluminum wire being first inserted, followed by four or five turns of a lead wire of slightly larger diameter, these last being calked in the usual manner. It is found that the aluminum does not cut, and it is not acted upon by the steam as the lead is, so that the joints, it is claimed, remain tight.

Is There Such a Thing as Luck?

Arthur McEwen tells the following in the Virginia *Chronicle* on "Uncle" George Hearst, the mining man:

All very rich men who have made their own fortunes are believers in luck, as they have reason to be. George Hearst, who thinks of a million as ordinary men do of a dollar or two, owned to me once that he regarded his possession of a great fortune as a sort of a miracle. "I was 49 years old," he said, "when the row made over the discovery of the Comstock silver mines in Nevada set the whole coast wild. I had been disappointed in the work I had been at, and found myself pretty nearly broke. I had enough to buy a horse and the outfit, and started over the mountains with a party of the boys. That broke me, and I wasn't feeling happy, because I'd worked and struggled and speculated for a good many years, and it struck me as rather rough that a man of my age should have to start out, as I did then, like a young fellow. There were about 10 or 12 of us in the party, and as I was blue they let me rather alone, and my mustang being rather worn down, I stopped on the trail, put my arm through the bridle, and picked out a rock to sit on. The rest of the boys rode on, but I sat there. There wasn't any reason why I should particularly, only I did. The whip I had was a willow switch I'd pulled from a tree as I rode along. As I sat there I switched the dust of the trail, and thought, 'Shall I go with them, or shall I go back?' I switched and switched, and thought and thought. I saw behind me all the hard work I'd done, all the chances I'd taken and lost on, and felt old, and need up, and no good. My sense told me to turn back and make my fight where I was known. There was safety in that, anyhow. But I'd been camping night after night with the boys ahead of me, and it made me lonesome to think of parting company with them. So after switching and switching the dust on the trail, and feeling weak and human because I yielded, I mounted my horse again and rode on after the party. I got to the Comstock and in six months I made half a million dollars. That was the foundation of what I've done since. Now, why shouldn't I have turned back when I hesitated? It would have been sensible, 'conservative' to do that, but I didn't, and because I didn't I won. If you're ever inclined to think there's no such thing as luck, just think of me."

WORTHY OF HIS HIRE WHEN HE MAKES HIMSELF WORTHY.—Western molders seem inclined to foment trouble with their employers. Indications of this are cropping out in a number of directions. Stove manufacturers have observed for some months past that even their best workmen were not turning out as much work as they could easily do and much less than might be reasonably expected of them. Trifling matters have been magnified into grievances, and men have transferred themselves to other shops on the slightest pretext, only to return again and conduct themselves still less satisfactorily than before. A strike in a large machinery establishment in Chicago last week developed the same condition of affairs in that line. The foreman of the works states, in a published interview, that the molders had latterly not been doing the amount of work that should be done in a day, and he had been obliged to discharge some of them on that account, whereupon the others struck. The uniform tenor of reports from foundrymen indicates concerted action on the part of the molders in various localities to cut down work. This is probably in sympathy with the movement among workingmen to reduce the working day to eight hours. It is to be hoped that the broad view of the situation thus set forth is not fully justified, as there never was a time when workingmen were so fully employed at good wages as is the case at present in the West. The relations between employers and employed should be of the best nature. No one is oppressed or asked to work at starvation rates, but he is expected to render a full equivalent for the wages he receives. "The laborer is worthy of his hire" when he makes himself worthy.—*N. Y. Iron Age.*

THE RIVER AND HARBOR BILL was signed by the President on Sept. 19th, and is now a law. Doubtless the most important provision of the bill is that appropriating $6 200,000 for securing a deep-water harbor at Galveston, Tex., a measure for whose success the South west has been working most energetically. It will be remembered that this site for a deep-water port on the gulf was recommended by a board appointed from the U. S. Engineer corps some months ago. Other Southern harbors receive generous appropriations, among them Savannah and Charleston. At the former port work is to be commenced on improvements which are intended to secure a safe channel with 26 feet of water from Savannah to the sea, at a total cost estimated at $6,000,000. The expenditure of the many million dollars appropriated by the bill will certainly have a very marked effect in giving employment to engineers and contractors, especially the latter.

THE PIKE'S PEAK RAILWAY (Abt system) is progressing rapidly to completion, in spite of some annoying delays. The first trial trip with a passenger car was made Aug. 14th; on the next day the road was opened to the public as far as the Half Way House, with two trains daily; but these were stopped Sept. 1st for lack of sufficient patronage and because it impeded somewhat the work at the front. The cars are nearly all glass from window sill to roof, with very narrow pilasters between windows. The track is now well above the timber line, within about 1000 feet of the summit.

Beatty's Improved Steam Motor for Pumps.

Judge H. O. Beatty of Sacramento had on exhibition at the State Fair his new steam motor for pumps recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency. This ingenious machine takes the place of an ordinary steam engine in pumping water with any kind of lift or suction pump. The steam is taken directly from the boiler or steam drum to the steam-chest of the motor, and from that chest rises directly under the piston in an upright cylinder. The piston-rod is connected with the pump-plunger, and as the piston rises in the steam cylinder the pump-plunger follows and discharges its load of water. When the piston reaches the proper hight in the cylinder, the valves in the steam-chest are reversed, the steam is shut off and that in the cylinder is set free. As the steam escapes from the cylinder the plunger returns to its original position by its own weight. As the piston reaches the bottom of the cylinder the valves are again reversed and another upward stroke is made.

This method of using steam only half the time (during the upward stroke) and wasting no power in converting direct motion into crank and circular motion and none in forcing water at high speed through crooks and elbows in small pipes, saves a great amount of steam-power that is wasted in the old-fashioned pumps.

In most of the direct-acting pumps, the steam cylinder is as large, sometimes twice or three times as large, as the water cylinder. The piston in the steam cylinder and the plunger in the water cylinder both having the same motion, it of necessity takes one foot or sometimes two or three feet of steam to raise one foot of water. But with this motor, according to the inventor, when the water is not raised over 20 feet in hight, the water cylinder is about seven times as large as the steam cylinder, so that a foot of steam raises from 7 to 20 times as much water as those pumps. Of course when the steam cylinders are two or three times as large as the water cylinder, then these pumps will raise the water much higher than 20 feet.

This motor is well adapted to running quartz stamps in portable quartz-mills. A small quartz mill can be manufactured with stamps of any desired weight, in which no one piece of the whole need weigh over 200 or 250 pounds. After this machine is set up and ready to run, no skilled labor is required. A motor and pump are set up at the Union Foundry of Root, Neilson & Co., Sacramento, and will be set running for the inspection of any one interested. A motor will also be exhibited at the Mechanics' Fair in this city.

SULPHURETS TREATED BY A NEW FREE-MILLING PROCESS.—That there will be little difficulty in treating the sulphuret ores of the gold district lying between Eagle and Rover creeks, west of Nelson, by the McArthur-Forest process, is almost beyond dispute. The process has been tried at Denver, Colorado, on ores from Chihuahua, Mexico, with the result of saving 90 per cent gold and 60 per cent silver. On low-grade refractory ores taken from Boulder, Gilpin, Rio Grande, Conejos and other Colorado counties, the result was even better than from the Mexican ore. In South Africa 1½ tons of concentrates from the Randt, containing 80 per cent of pyrites, were treated as a test, giving a result as follows: Gold in concentrates before treatment, 24 ounces 10 pennyweights; gold in residue after treatment, traces; extraction over 99 per cent. This method of treating concentrates has the advantage of great simplicity and economy, combined with the highest efficacy in practice and results. In Scotland, where the McArthur-Forest Company has its main plant, ores from Chili are treated, and enough money is made to create a value of $16 50 for stock worth $5 at par.

ALL of the window-glass manufacturers of the United States, those of New Jersey alone excepted, will be known hereafter as the American Glass Co., with principal office in Pittsburg. The property of the different firms does not pass into the possession of the combination, but is controlled by it nevertheless. Each factory, large or small, will pay $5000 in cash or in goods into the common treasury and will send one delegate. The delegates elect a board of directors, who will practically run the entire window-glass business of the country. They will do all the selling to the agents or jobbers, no factory being permitted to sell individually through any other agency.

THE Seattle, Washington, *Press* says that the immense lumber production of the Puget Sound mills exceeds that of any other section in the United States. During the year ended May 31st the quantity of lumber manufactured on Puget sound was 303 986,692 feet. Of this quantity 233,481,057 feet were shipped to foreign and coastwise markets. To foreign ports 163 vessels carried 172,502 205 feet of lumber valued at $1,438,847. In the coastwise ports were marketed 160,978,852 feet of lumber, which was transported in 262 vessels.

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XIV.

[Written for the Press by James H. Crossman.]

The Black Hawk Mining District.

This district is situated in a spur of the San Bernardino range of mountains of the same name on the district. Its trend is easterly and westerly, and it contains on its northerly flank an important belt of limestone, to which reference has been made in article three of this series. This belt cuts on important figure in the mineral resources of San Bernardino county. Adjoining its incasing rocks on either border, the limestone is dolomitic in character, containing on its southerly contact with a metamorphic granitic rock, veins of quartz and spar carrying the ores of lead, silver and copper, while on its northerly border gold and silver predominate.

This belt of lime is from four to six miles in width, extending and traceable at intervals from Bear valley to a point near the Colorado river. It contains in its make-up nearly all the varieties of limestone known to exist: Blue limestone suitable for manufacturing the lime of commerce, a carbonate of lime, pure crystalline and white, for structural or sculptural purposes; magnesian limestone, dolomite, known by the Latin races as the "metallic oriador." Its boundaries on the south are a granitic rock, and on the north a micaceous schist, underlaid by syenite and gneiss, but on both borders of the contact dolomitic rocks occur.

On the northerly border of this belt we find the series of mines known as the Black Hawk group, consisting of 21 locations, the most of which comprise an area of 1500 by 600 feet on the main mineral belt that here traverses the country.

The summit of Black Hawk mountain is 6720 feet above sea level. The bottom of the ore deposit on the Hecla is 5830 feet above sea level, and the top 5855 feet. The bottom of Tunnel No. 2 on the Lookout is 5250 feet, and of Tunnel No. 1, 5275 feet above sea level. The entrance to Black Hawk ravine from the desert is at an elevation of 4100 feet.

These mines are situated on the northerly flank of the range as it slopes toward the desert. The apex of the mountains at a point opposite the group in a southerly direction is 6700 feet high. Descending the mountain, we reach the Santa Fe and Lady Alice at an elevation of 6050 feet; at a lower elevation, and lying parallel, the Calumet and Hecla occur at 5855 feet. These four locations course with the stratification and dip into the mountain southerly at an angle of 35 degrees. They are well set in their incasing walls, showing no evidence of disturbance or displacement.

The remaining 17 have a reverse strike and lay conformably on a hard slenitic floor, dip southwesterly at a small angle of inclination as well as easterly and westerly from the ridge's center, varying in thickness from 10 to 60 feet. Strictly speaking, they form a blanket of gold-bearing quartz covered by from 10 to 40 feet of soil and debris. The quartz, to all appearance, has in places been by some powerful dynamic force pulverized, broken, disintegrated and crushed into a condition to be fed to the mill-hopper after passing over a grizzly to remove the coarser pieces. It contains bright particles of gold often visible to the eye, and is accompanied by some base which is not easily amalgamated. The ore here can be mined and milled at a very low figure. This deposit has been developed in a number of places by a system of open cuts in a quarry form, several tunnels having also been driven at right angles with the strike into the mass.

A Big Slide.

The observer would at first be puzzled to account for the origin of this singular formation, a blanket deposit gently sloping from the mountain toward a lower level. (This position of the vein would be reversed if it were in place undisturbed.) This mystery is solved if we ascend the precipitous mountain slope and examine the footwall of the Hecla and Calumet veins, which consists of a soft and easily decomposed variety of a calcareous schist, containing sufficient magnesia and talc when wet to slide and break away with the weight of the superincumbent mass. In point of fact it is a slide or slip of the face of the mountain on a mammoth scale. The movement was so slow that nothing has been displaced in the change of the lode from its former semi-vertical to its now nearly horizontal position. An estimate of the number of tons involved in this displacement would take a formidable array of figures. The quartz in the deposits has been estimated by good judges to carry gold values of from $2 to $25 per ton of 2000 pounds. Several drifts have been extended into the ore body for a distance of 180 feet, the face of which shows 20 feet of ore.

The outlook for the Black Hawk mines is particularly bright. A portion of this property (the Lookout and Buena Vista mines) has recently been sold to an English syndicate, who have since erected a 10-stamp mill upon them, the property being under the superintendence of Harry Del Mar. Wood for fuel and timber for mine purposes are abundant within a reasonable distance of the mines.

This company has brought in water through pipe from several springs in the vicinity, and is utilizing it for power as well as amalgamating purposes. It is claimed that there can be procured a sufficiency of water for a 100-stamp mill, the source of supply being at so great an elevation that any desired amount of pressure can be obtained.

Among the principal supplying springs, the Crystal is situated at an elevation of 6120 feet; the Arctic at 6450, and the Live Oak at 6700 feet above the level of the sea.

Reserves.

On the Santa Fe and Lady Alice, the most southerly mines of this group, the ore body has been exposed for a length of 800 feet by a width of 34 feet.

The Hecla, which joins the Santa Fe on the north, shows a large body of ore, some of it high grade.

Lady Alice and Calumet adjoining are but little worked. The Pinon claim shows a large body of ore, some of it being high grade.

The Lookout, adjoining the Pinon on the north, shows also a large body of ore (30 feet thick) 1000 feet long, much of it high grade. This mine has been opened by two tunnels 180 feet apart, and each 100 feet long; several open cuts having also been run, an upraise has been made through the ore to the surface.

The Senator mine joins the Lookout on the north, and shows a large body of ore opened by two short tunnels and open cut.

Black Hawk mine joins the Senator on the north, and shows a body of ore 600 feet long and from 10 to 60 feet thick, considerable of it high grade. It is opened by two tunnels 40 feet apart and several open cuts.

The Morongo King, Glasgow and Overly Scott.

Situated on the same vein and contiguous to each other, lie on the eastern slope of Black Hawk mountain, 18 miles easterly from the Cushinghury Ranche, at an elevation of 4500 feet above the level of the sea. The vein takes a curvilinear form, striking northwest to southwest. It lies between granite and a micaceous schist. On the Morongo King a shaft has been sunk to a depth of 180 feet, with lateral drifts of 30 feet. The ores are bunchy and spotted, but reported to carry gold values of $12 per ton. Eighty feet northerly from the first-mentioned vein, on the Overly Scott, a shaft of 14 feet deep has been put down. Antelope Springs, easterly ½ mile, would furnish enough water for mill purposes. There is wood for steam in the vicinity.

Preciado & Vader's Group of Mines

Are situated in Tp. 4 N., R. 6 E., 3 miles westerly from Old Woman's Springs. The locality is known as the Silver Reef. It lies in the same mineral belt and easterly from the Black Hawk group of mines. This district is but little known, nor are the lodes here much prospected, though quite numerous. Some of them show considerable strength, their ores carrying silver with traces of lead and copper. Several locations have been made by a Mexican company and a shaft has been sunk on the Hermosillo mine to a depth of 100 feet, from which there has been extracted about 100 tons of ore. This ore, graded to values of 84 ounces per ton, was hauled to Victor by wagons and thence sent by rail to San Francisco for reduction. Strike of vein, N. 40 E.; formation of incasing walls, lime (magnesia) and a porphyritic granite. But seven locations in all have been made here; the only developments of any account are on the Hermosillo and Santa Maria.

The Morongo Mining District

Lies on the southerly flank of the San Bernardino range of mountains. The formation here consists of metamorphic and porphyritic rock in which several large springs come to the surface. Scattered gold-bearing veins occur throughout the district, but are yet unimportant as producers, not having been developed to any extent.

The Rose Mine

Lies 14 miles southerly from Cushinghury, at an elevation of 7250 feet and near the head of Rattle Snake Canyon. The vein is heavily charged with iron in an oxidized form, and is said to carry gold values from $5 to $110 per ton. Its strike is north 20 west, and it is inclosed in walls of micaceous schist and talcose slate. It crops strongly for a distance of several thousand feet, and has been developed by a shaft to a depth of 100 feet. Two miles southeasterly from this mine there are a number of small veins from two to four inches thick, the ore from which has been worked by Mexicans in arastras, yielding over $100 per ton.

The Lawrence Mine,

A silver-lead bearing vein, situated in Rattle Snake Canyon, is four feet thick and developed by a 40-foot shaft and drift of same length. Its strike is north 40° east, dip southerly at an angle of 45°, vein inclosed in a formation of granite and micaceous slate.

The Morongo mine, 2000x600 feet, is situated in Pioni valley, 10 miles in a southeasterly direction from the Black Hawk mines, and six miles from Bear valley, in the Black Hawk mining district, and at an altitude of 6300 feet. The strike of the vein is N. 70 West, dip South 55 degrees. The footwall is composed of lime shale; hanging-wall, dolomite. The vein varies in strength from 10 to 40 feet and is reported to carry silver values of from $10 to $400 per ton. Capt. Peter Mackie, co owner with Messrs. Nichols & Childs of Los Angeles, reports that 300 tons of select ore were shipped to Colorado, Argo and Denver that returned $400 per ton, average value $45; the ore contains galena and silver, the latter in the form of a chloride with a small percentage of gold.

The mine has been developed by a series of shafts (nine in all) of varying depths, the deepest being 137 feet, where crosscuts show the vein between walls to be 40 feet thick.

The Yucupa mining district is situated 20 miles E. N. E. from Colton. In this district the Southern California Land and Stone Company have opened a promising quarry of sandstone and erected a mill on Mill creek. The stone here obtained consists of two varieties, the first and most valuable being a hard, fine-grained bluish rock, the second yellow and coarse, with less tensile strength. The rock splits and dresses well and can be quarried in blocks of any desired dimensions. This stone is known as the mentone and has acquired quite a reputation for structural and street-paving purposes. In the vicinity of this quarry a strong belt of limestone courses easterly and westerly, on which a quarry has been opened, kilns erected and commercial lime produced. The formation here, which has been highly metamorphosed, contains granite, porphyry and magnesian slates with metalliferous veins of quartz carrying the ores of both silver and gold. But little development work has, however, been done.

The Digleer

Granite quarry is situated on land owned by a colony of that name, 12 miles west of Colton and 4½ south of Cucamonga. Though this quarry has not recently been opened, we have good accounts as to the quality of the stone.

Clay.

A valuable body of clay exists in the vicinity of Colton, from which a first-quality of brick is burned.

(To be Continued.)

Diamonds in Australia.—It appears from a publication recently issued by the Government statisticians of New South Wales that many descriptions of gems and gem stones have been discovered in various parts of the Australasian colonies, but no systematic search has been made for any but the diamond. Diamonds are found in New South Wales, Victoria and Queensland, but only in the first named colony have any attempts been made to work the diamond drifts. The principal diamond-fields are situated at Bingera, near Inverell, in the New England district. The Government of New South Wales has on various occasions obtained the service of experts to report upon the fields, as well as the gems which have been from time to time extracted from them, and these reports, it is said, have generally been of an encouraging nature. The number of diamonds found in the colony to the end of 1887 is estimated at 75,000, the largest one being 5⅝ carats, or 16 2 grains. The diamonds occur in old terrestory river drifts, and in the more recent drifts derived from them. The deposits are extensive and have not yet been thoroughly prospected. The New South Wales diamonds are harder and much whiter than the South African diamonds, and are classified on a par with the best Brazilian gems. During the year 1887 the diamond companies at Cope's Creek, near Bingera, produced about 23,000 diamonds, weighing 5151 carats; but in 1888, owing to the severe drought which occurred, the search for diamonds had to be temporarily abandoned.—*Mining Review.*

New Mexico Onyx.—Mrs. L. J. Caldwell of Chicago is the owner of ricolite and green onyx quarries being operated in Western Grant county, New Mexico. This is one of the most remarkable discoveries. The stone has the form of true fissure vein 50 feet wide and over a mile in length, and it is taken out in massive blocks and taken to Chicago, where it is becoming very popular for house decoration inside and outside. The stone is susceptible of a very high polish, and of a variety of colors—dark green and cream, striped and mottled, also pink and salmon. In fact, it carries what are termed the "lost colors" in stone. It is very tough, is superior to Mexican onyx, and is the only stone of the kind in the world that can be carved. Contracts have been signed to furnish to the new Alhambra theater and hotel and other public buildings in Chicago for decorative purposes. Mrs. Caldwell offers blocks of it to be used in the construction of the New Mexico exhibit pavilion at the World's Fair.—*Stone.*

Tunneling under the New York Narrows.—The long-talked-of scheme of tunneling under the Narrows in New York harbor has, it is announced, been seriously taken up by well-known capitalists, and it is quite possible that in the course of a few years we shall see railroad lines connecting the Great West with the eastern end of Long Island and ocean ferries to Great Britain. It is considered that the most desirable line for running a tunnel is one from somewhere near Fort Wadsworth, on the Staten Island shore, to Bay Ridge. The scheme, as far as known, contemplates the construction of two parallel tunnels at a depth of 35 feet below the bottom of the bay. The length is roughly put at one and three-quarter miles, and the cost, it is estimated, would not exceed $5,000,000, as it is considered that there will be no particular difficulty attendant upon the work of construction.

The largest and highest electric-light tower in the world is to be erected in Minneapolis.

North Dakota Coal.

For the past five years the question of transmitting coal from the coal-beds of North Dakota down the Missouri river to Pierre has been under discussion, but owing to the general stagnation of business throughout the State since 1886, and the falling off of transportation on the river, the question for a time was lost sight of, but with the advent of the large river boat, the Ahner O'Neal, or the Chaska as it was at first called, the people were again awakened to the necessity of taking hold of this matter of supplying this portion of South Dakota with cheaper fuel. The matter was arranged, and Mr. A. L. Silver, a practical coal man, was sent to North Dakota to investigate, and he was so favorably impressed with the outlook that he immediately purchased several hundred acres of these coal lands north of Bismarck and is now organizing a company, with a capital of $30,000, to begin active operations. The coal can be transported in barges with a capacity of 100 tons each or thereabout, and under the most liberal estimate it can be docked at Pierre for $2 per ton. It can be shipped to Chamberlain and other points below at about $2.50, and can even be shipped from here by rail and delivered in Huron at about the same figure. It can be readily seen that the retailer can make a handsome profit and sell this coal at less than one-half the present price of Iowa coal. The quality for soft coal is good, and will compare favorably with the soft coal shipped from the other States. A company of Iowa men have purchased 3000 acres of these lands and incorporated the North Dakota Coal Company, and in order to ascertain the heating power of this coal an analysis was procured from S. W. Johnson, Professor of Theoretical and Agricultural Chemistry of Yale College: Water, 14 88; volatile, 36 72; fixed carbon, 44.51; ash, 3 44; sulphur, 45.—*Yankton Herald.*

Railway Earnings.

The net earnings of the railroads in the United States amounted for the first seven months of the present year to $95 408,090, against $103 535,117 during a corresponding period in 1889. This falling off, the first that has occurred for many months, has been due mainly to heavy decreases by a few of the large systems, the general condition of net earnings being better than the figures indicate. The principal cause for the decrease is a large increase in operating expenses amounting to over $3,000,000. It is also to be remembered that the result of operations for the month is being compared with a very favorable month last year.

Dam Failures have been numerous. The dam at the outlet of Bonesteel Pond, 12 miles east of Troy, N. Y., gave way Sept. 18th, and the flood carried away buildings, dams and bridges for several miles. On the same date a dam near the head of Broad Brook, in the town of Ellington, Conn., gave way, and the flood swept down the valley for eight miles to the Connecticut river, carrying out five dams, two railway trestles and six highway bridges. The total loss is set at $50,000. Highway bridges have been carried away by floods in many parts of New York and New England.

The high price and uncertainty of the supply of natural gas at Pittsburg have resulted in three large iron-mills going back to the use of coal for steam purposes. One mill at Alleghany has begun again the exclusive use of coal as a fuel. Natural-gas company managers believe the supply will soon be increased by new wells now under way, and point out that many industrial consumers of natural gas have used it extravagantly. The introduction of the meter system in connection with natural gas supplied to industrial establishments promises to induce more economy in its consumption.—*Bradstreet's.*

The Sequoia Park.—Secretary Noble has promulgated rules and regulations for the government of the park in Tulare county, containing the mammoth sequoias trees, created by Act of Congress and approved Sept. 25, 1890. The secretary christens it "The Sequoia National Park." The rules for its regulation are substantially the same as those covering the Yellowstone Park. The secretary said that if he found it practicable he would procure from a tract adjoining the park a section of one of the mammoth trees for exhibition at the World's Fair at Chicago.

The Pittsburg *Dispatch* predicts that by the end of this year the Pittsburg district will be producing 1000 tons a day more pig iron than formerly, or an increase over last year of 33⅓ per cent. The present capacity is about 3000 tons per day, of which 700 tons is mill pig and the rest Bessemer. The present year will see more blast furnaces erected or nearing completion in that district than ever before. In all, seven new furnaces have been projected.

The Philadelphia City Hall.—The tower of the City Hall is now 335 feet high, yet on top of that 8000 tons of iron and bronze are to be placed. There is to be a clock-tower, the dials of which are to be 27 feet in diameter, surmounted by a statue of William Penn 37 feet high, and there will be numerous statues,

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

THE GOLDEN GATE RIVER-BED ENTERPRISE.—Oroville *Register*, Oct. 4: This great work, under the supervision of Maj. McLaughlin, is being pushed steadily forward, an army of men with a great number of teams being employed on the dam, flumes and canal in course of construction. Some idea of the strength and magnitude of the dam here required will be gained from the fact that the Feather river carries here in the winter from 15 000 to 18,000 cubic feet per second. There can be no doubt but an enormous quantity of gold-dust will be taken out here when the company reaches that stage of the business.

Calaveras.

DROPPING THE STAMPS.—*Citizen*, Oct. 4: The 10-stamp mill of the Sandy Bar M. Co., which has recently been completed, commenced to drop stamps steadily last week. We expect to hear good reports from that property.

THE OLD PIONEER. — A rich strike has been made in this claim situated half a mile west of Angels Camp. The ore is rich in free gold. It will have to be crushed first and the free gold amalgamated, after which the sulphurets will have to be concentrated and taken to the chlorination works. The sulphurets assay from $128 per ton up to $700 per ton. No accurate or even approximate estimate can yet be made of the development, but from what is in sight the owners are satisfied that they have a fortune. This simply shows what industry, intelligence and scientific mining can accomplish. Mr. Hallock was led to commence operations at the present point of development, from his long systematic and scientific study of the meaning and application of mineralogy and geology.

Inyo.

INYO MARBLE QUARRY.—*Index*, Oct. 4: The mill at Verdi, on the Truckee river, Nevada, started up on Sept. 24th, in charge of Capt. Bronson. Mr. Paige, who superintended the erection of the mill and placing of the machinery, has returned and will assist in the management of the quarry. Just now nothing is being taken out except white marble for the Mills building, San Francisco. This is shipped to the mill for dressing, at the rate of two carloads per week. Moss agate and yellow marble for the interior of the building will be taken out later. Twenty men are at present working in the quarry.

SYLVANIA DISTRICT.—*Register*, Oct. 2: There are indications that Sylvania will soon be a booming camp, for some of the rougher features of society that inevitably cling to a new mining town are occasionally displayed in this camp, though thus far not to such a violent degree as was the case in the palmy days of Bodie. Three eight-hour shifts have been put on in the Liberal shaft, and they are sinking as fast as powder and muscle can do it. Work on the Climax mine is progressing favorably. Engineers Geo. Thorpe and Frank Higgs, with Furnace-men Preston and Davis, are busy getting the furnace, engine and blower ready for smelting.

Nevada.

ON THE LIBERTY HILL DIVIDE.—*Transcript*, Oct. 6: The Swamp Angel drift mine at Lowell Hill is now in rich ground and about 20 men are employed. The last family remaining on Remington Hill removed last week, and now that once populous section does not contain a human being. The East New York drift mine at Lowell Hill and adjoining the Swamp Angel, is doing so well that the force is being increased. Six men are now at work and weekly cleanups are being made. The shaft in the Ben Franklin mine is down 120 feet and is in good sinking ground, after having successfully passed through the 60 feet of caved ground, consisting of mud, sand and water.

THE IDAHO STRIKE.—*Tidings*, Oct. 7: We are informed by Mr. Edward Coleman that the new ledge cut in the Idaho shaft, near the 1800 level, about a fortnight since, holds its own and encourages the belief that a permanent vein has been discovered. This wonderful mine is likely to see the rise and fall of many other dividend-payers before the last ton of ore is dug out of its bowels.

GOOD ORE.—Many people who visited the pavilion during fair week will remember the exhibit of gold-bearing ore which was brought from the Washington mine. After the fair the rock, which weighed 1000 pounds, was milled, and from it was secured 2.81 ounces of pure gold.

HERMOSA MINE.—The owners of the Hermosa, who are all workingmen, have been busily engaged for some time in getting ready machinery with which to work their mine. Some of the machinery has been placed in position and in a short time they hope to be ready to start. The pumping machinery, rods, hohs, etc., from the Osborne Hill property will be used. They have every reason to believe that they will soon have one of the best prospect mines in the district.

Placer.

MINING GENERALLY PROSPEROUS.—*Republican*, Oct. 6: With the exception of the hydraulic branch of the business, now dead, mining is generally prosperous throughout this county, this having been with the drifters and the river-bed operators a fairly good year. The Hogshack tunnel is now completed a distance of 2510 feet. A perpendicular 5x8 feet upraise will be started up at once with Ingersoll drills which will tap the channel in about 170 feet.

Plumas.

VARIED DISPLAY. — Quincy *Journal*, Oct. 4: A fine display of gold-bearing quartz was on exhibition. The rock came from Rich Gulch, on the east branch of Feather river. The richest specimens were taken from the claim of Fred Lewis. In the collection was a bottle of free gold. There were also some rich specimens from the Hallsted ledge. These samples fully illustrate Plumas county for extensive ledges of gold-producing rock, and amply justifies the expenditure of capital for the development of this great industry. The lapidary collection is very interesting and brings to light the curious formation of some of the stones which may be seen every day, covering the mountain-sides and filling the gulches. The agates, particularly, are wonderful, and the water crystals might easily be mistaken for diamonds.

San Diego.

MORE QUARTZ-MILLS.—Julian *Sentinel*, Oct. 3: Three new quartz-mills are to be erected in Banner City immediately by the following parties: J. I. Minear, Capt. W. S. Kerr and the Gold King Mining & Milling Co. Step by step the forward movement goes on in this district and it will not be many days until "the Julian back-country" will be the theme instead of a by-word. Capital, energy, perseverance and faith are bound to win in the end, and they are all fast being brought to a culmination in this camp.

Shasta.

MINING NOTES. — *Free Press*, Oct. 4: A 10-stamp mill was loaded at the depot this week for the Gladstone mine near French Gulch. Eighteen bars of silver bullion were shipped this week from the Lost Confidence mine at Iron Mountain. Wm. Kellner took $600 out of a pocket near his cabin at Centerville. Several tons of ore from the Beecher mine, in the Lower Springs district, were unloaded at the concentrating works here this week. Sheriff Hopping has backed several miners in the county to the tune of $2000 in the past two years. Many good developments have been made through his liberality. It is reported that ex-Sheriff Ratchford of Modoc county has struck a rich ledge between Centerville and Texas Springs. He has hauled a quantity of rock to the concentrating works here. Matt Hume and Vivian have a valuable mine at Slick Rock, this side of Iron mountain. They have a tunnel in 60 feet, have crosscut the ledge and followed it 20 feet. The quartz is perfectly white and contains a liberal spattering of native gold. The ledge is two feet wide and promising.

Sierra.

GRAVEL AND QUARTZ.—*Mt. Messenger*, Oct. 4: About a year ago a company undertook to explore the country around Fir Cap and Saddleback mountains, believing that it contained much gold, both in gravel and quartz. Their ground includes the old Fir Cap gravel claim, from which was taken in early days $400,000. This was taken from a rich pot hole, which, being worked out and no more pay gravel found, operations were suspended. It is now believed that this gold was taken from a secondary and not from a primary pliocene gravel channel, and that large portions of a primary channel may be found near by, both north and south. While the original company was at work it discovered a promising quartz ledge, but did not prospect it. Just below this ledge many specimens of quartz gold were found, suggesting the idea that a paying ledge was near. John Mitchell owned the property many years, and it was he who organized the present company. Under his supervision, the old tunnel, over 2000 feet long, was repaired and the task of exploring the ledge begun, and although but just fairly started, quartz that prospects exceedingly well has been taken out, and it is probable that at no great distance a rich chimney may be found. That good gravel diggings may be found in the large flat above Fir Cap is more than probable, it being almost a certainty that a gravel channel runs, or at some time did run, from near Saddleback to Monte Cristo. This channel will be looked after later, it not being practicable to prospect both at the same time.

NEAR ALLEGHANY.—It is reported that richer quartz has been struck in the Grant & Appel mine near Alleghany.

MINING NOTES.—*Tribune*, Oct. 7: The lower tunnel at the Salinas & Mercer mine is to be run ahead. Five men are working there. The machinery for the Mountaineer ten-stamp mill is being hauled to the mine. That property is looking fine. Several hundred feet of tramway, reel, rope, dump-house, etc., has been purchased by the Chipps mine owners, from the Sierra Buttes company. A. J. Fraitas, who was injured in an explosion at the Young America mine some weeks ago, is now able to get around a little. Wm. Dawes has gone up to work on a gravel claim in the Gold Lake country. It is called the Downieville Mining Co. Messrs. Cook and Clark have arranged to ship 1500 pounds of ore from their mine at Meadow Lake to the Selby Smelter to be worked. They are confident of receiving big returns therefrom.

Trinity.

CANYON CREEK.—*Journal*, Oct. 7: The Fisher Gulch M. Co. has purchased a Huntington mill and will have it on the ground ready to set up in about three weeks. It will be run by water-power, a Pelton wheel being used for that purpose. C. W. Smith informs us that the force on the Bailey mine is now working on the ledge first tapped. As far as they have run the tunnel on the ledge the ore shows up well. Grigsby & Shattuck are getting in their mill as fast as possible, and will probably have it all on the ground in a few days, and in about 30 days they expect to have it running. All work in the camp is being pushed ahead and some time this fall it will be found what a few of the ledges contain.

Yuba.

RIVER-BED MINING.—Nevada *Herald*, Oct. 7: There are still many men working the channel of the Yuba river between Bridgeport and Mooney Flat, and a great deal of gold is being taken out. The miners, however, have one difficulty to contend with. There is a great deal of lead in the gravel, brought there from the mines, and this makes it somewhat hard for them to clean the dust after it is amalgamated.

NEVADA.

Washoe District.

ON THE COMSTOCK. — Territorial *Enterprise*, Oct 7: Col. Samuel Curtis has arrived to take charge of the Keyes property. He states that the new management intend to resume work on the property shortly, and that they will endeavor to make it pay. No change in the control of the Andes mine will take place until Wednesday next, when, it is reported, a clean sweep will be made of the old management and a full board of new directors will be elected. In the meantime an expert has been employed to examine the books of the company at the solicitation of Directors Hall and Turnbull.

Candelaria District.

DIVIDEND PAID.—The dividend of 40 cents paid by Mount Diablo last week was the first this year. It amounted to $20,000. It is the fifteenth, and makes a total of $180,000. There have been three assessments in all, amounting to $137,000, the last assessment having been levied in June, 1889. The mine has just shipped $10,671.

THE HOLMES MINE.—During the week ended Sept. 18th the Holmes mine had 322 tons of ore crushed. The battery samples averaged $25.80 per ton. A bullion shipment valued at $3712 has since been made.

Dun Glen District.

DUN GLEN.—*Silver State*, Oct. 7: Gen. Buckner, while at Dun Glen a few days ago, saw the proceeds of 7½ tons of gold-bearing rock worked in an arastra by Samuel Thomas. There were over 50 pounds of amalgam, estimated to be worth $4000, which would make the ore worth over $500 per ton. The Hendra brothers are running a five-stamp mill on gold-bearing rock, with good success. The ore pays well and the Hendras are getting rich, as they deserve. There are 26 Chinamen at work placer mining in Barbour Canyon, and several of them have made homestakes and are going back to China. Every canyon in the Dun Glen mountains abounds in gold, and there are undoubtedly rich gold-bearing quartz leads in the range.

RYE PATCH.—This old mining district, situated on the westerly slope of the Humboldt range, is coming into prominence once more. The Walton group of mines are once more attracting attention, and there is little doubt but some profitable bullion-producers will be opened up there before long. This district is close to the line of the Central Pacific railroad, besides which it possesses many other advantages that ought to recommend it to the favor of capitalists.

Hawthorne District.

FROM VARIOUS MINES.—Walker Lake *Bulletin*, Oct. 4: Not much is being said lately about the mines of this vicinity. This is not because we have not good mines, but because our people prefer to quietly develop the properties without making extravagant statements of the quantity and richness of the product. Through the kindness of Mr. Knapp, one of the owners of the Confidence mine, we are permitted to publish the following figures, showing the production of that mine for the past six months: Production from March 1st to Sept. 1st, 1890, $25,466. Dividends were paid during this period aggregating $12,800. The above yield was the product of 94 tons and 746 pounds. In addition to the ore shipped to the mill there still remain on the dump 400 tons of second-class ore. This ore averages 50 ounces to the ton. The mine is producing as usual, and the prospects are good for a large body of ore. The main drift is in 300 feet, and renders the working of the mine much easier than formerly. About 16 men are employed. The Eureka mine, situated 20 miles north of Luning, of which S. A. Knapp is one of the owners, is showing well. This claim shows three parallel ledges from four to six feet apart, ranging in size from three inches to two feet. The ore extracted is rich, assaying 1000 ounces per ton for first class and 100 ounces for second class. The Western Belle is attracting considerable attention just now. Taylor & Gilman are the owners. They are now sinking on the contact and the assays run up in the thousands. The vein is a foot wide and is improving as depth is attained. Three men are at work. Cook & Hamlin are working three men on the Central. This mine is the best producer now being worked in Hawthorne district proper. They are shipping about $1000 per month steadily. M. Martinez is extracting very good ore from the Lotta mine. Dave Millsaps reports that he has struck a streak of ore in the Horseshoe at Garfield which yields in the neighborhood of 1000 ounces to the ton. Kimball & Waddell keep two men going on the Early Dawn, with good prospects ahead. Geo. Olsen is taking out some excellent ore from the Hanover. The Woodchuck at Marietta employs five men. The owners are Messrs. Knapp, Purcell and Maguire. The ore is silver, lead and gold. About 200 tons have been shipped since January. The ore averages 40 ounces silver, $4 gold and 50 per cent lead. Two men are working in the Mountain King. A tunnel is now being run on a spur of the vein, extracting ore which yields 65 per cent lead and 160 ounces silver. The Pamlico is still closed down on account of litigation. The Lapanta and Baltimore will be started up this fall.

Humboldt District.

BURNED.—The Humboldt Reduction Works at Winnemucca were destroyed by fire early Wednesday morning. The property was owned by Alex. Wise, and was considered worth $25,000. There was $10,000 insurance on the works.

Schell Creek District.

DEEP CREEK.—Salt Lake *Tribune*: J. N. Dunyon of Tooele county has returned, bringing with him some fine samples of silver-lead ore from the Clifton mining district in the Deep Creek country. The specimens assay 400 ounces in silver to the ton. He also has in his possession a four-ounce phial full of coarse gold, which was taken from the rocks in that locality by crushing them with sledges. Deep Creek country will in time become one of the richest districts in the Territory, and the advent of a railroad into that region is only needed to hasten the day when thousands of tons of rich ore will be shipped from there to the Salt Lake Reduction Works.

Tybo District.

TYBO MINE. — Walker Lake *Bulletin*, Oct. 1: The old camp of Tybo in Nye county will soon be the scene of great activity. An English syndicate has purchased from N. S. Trowbridge & Co. the 2-G mine, mill and works, and the Dimmick mine from Luse and Dimmick. These mines have produced millions in times past, and there is every prospect of revival of their past prosperity.

ARIZONA.

YUMA COUNTY.—*Citizen*, Oct. 1: Skilled miners do not have to go out of Yuma county to make a "stake." If placer work is not tasteful, the muscular seeker after wealth can find a score of low-grade mines near the Colorado river in this county, which can be worked with profit and ease by concentrating, shipping to San Francisco and receiving therefor the bright and fascinating double eagles "in quantities to suit." La-Oche, an old Papago Indian miner, brought into town a few weeks ago gold dust to the amount of $59, representing one week's labor in the Gila City placers. This, of course, was a very unusual return in so short a time, but La-Oche says that he never earns less than $2.50 per day in the Gila City placers, and that without working very hard. J. Burns and Charley Lee, well-known miners, came in from the Pot Hole placers yesterday for the purpose of purchasing supplies. They report the mines in their district in a prosperous condition and producing gold in paying quantities.

MAMMOTH.—This camp is a blessing to the river, affording ready sale for nearly all the ranchers have to sell. The new road to the Oracle will give us relief, reduce the time in making the trips and the price of hauling. The camp is continually increasing and we look forward to the time when 100 stamps will be dropping. The Mammoth mill is now dropping 50 stamps day and night which reduces 100 tons of ore every 24 hours. There are about 50 men working in the mine and mill; six or seven are working in the stopes and knock down enough ore to supply the mill. There are about 30 men on development work in the mine. It is evident the mine is giving good returns, as the addition of 30 stamps recently indicates. An aerial tramway is to be put up at once from the mine to the mill, which is three miles distant, and it is said that 60 more stamps will be added to the mill within the next few months. The district is coming rapidly to the front, many prospectors are coming in and new buildings are being erected.

PLACERS.—From 40 to 80 Mexicans are at work constantly in the Greaterville placers, and make from 75 cents to $1.50 per day to the hand, working by their imperfect method. An effort is about being made to bring in water from the Santa Rita mountains, five miles distant. Should this succeed, a much larger number could find employment here at more than double the above wages.

GILA COUNTY.—*Silver Belt*, Oct. 1: The trial of working medium and low-grade ores in the Nugget mill will be watched with considerable interest. In case 40 and 50-ounce ore can be worked with profit, it will give an impetus to silver mining in this district, as there are considerable quantities of such ore within easy packing distance of the mill. In anticipation of the success of the experiment, miners have purchased the dumps of several mines at and around Quartzite and Richmond Basin, which they propose having worked.

ARAVICA.—Mining business is prosperous and improving. The Esperenza mine, which has been shut down for some time, will be started up again in the near future. P. Peyron having lately obtained possession of it intends bonding it to Eastern parties. The Austerlitz mine will be started up soon, having been shut down on account of the Aravica mill having been idle. The Yellow Jacket mine is working regularly and the machinery is now on the road from Tucson. The buildings are in readiness, and the new mill will be in running order about the 1st of January. The Old Stiff mine will be opened in the near future, as will several others in that region.

MOJAVE COUNTY.—The outfit, says the Mojave *Miner*, for testing the McArthur-Forrest process of working ores, which was ordered some time last month by L. L. Bequette for the Atlantic Mining Co., has arrived, and will be taken to the mine as soon as teams can be obtained to haul it. C. E. Sherman will soon commence work on the Independence at Chloride. He is putting up a new whim and getting things in shape to do considerable work before the year ends. Roges. Shippy & Shearick, who have a lease on the Altatta dump, have between four and five carloads of ore on the way to the sampling works. Henry Matsen is in from Ivanpah with three tons of rich rock. A strike was made on the Nellie Bly mine, in Wallapai mountains, by Wm. Morrison, who has a lease on the mine, from the owners, W. A. Neal and T. A. Groin. A three-inch streak which assays 800 ounces in silver and a two-foot streak which assays 80 ounces have been struck. Conkey and Bradon have thrown up their lease and bond on the Tuckaho mine. The sinking of the shaft on the Empire mine is now progressing at the rate of three feet a day. Messrs. James & Eames, who have purchased a number of mines in the neighborhood of Todd Basin and Cerbat, have decided to build a five-stamp mill at the junction of the Todd and Union Basin roads. The mill will be a complete one, and work on the foundation has already been commenced. Mr. Eames has gone to California for the machinery. T. W. Boggs arrived lately from Big Bug district with about $2000 in gold, which amount was recently taken from the placers. One piece to be seen at the Bank of Arizona is worth $15. A great deal of the gold was of the coarse order.

BRITISH COLUMBIA.

AT THE POORMAN MINE.—Nelson *Miner*, Sept. 27: The men here have been laid off on account of the scarcity of water in the mill ditch, but they were told that they would again be put on should the water supply be appreciably increased by rainfall. The last cleanup at the mill is reported the largest made during the run. Work on the tunnel to tap the ledge at a depth of 300 feet is expected to begin within the month, as there is sufficient water in the ditch to run a Burleigh drill, which will be used in prosecuting the work.

AT 49 CREEK.—It was expected that everything to begin hydraulicking would be in shape today, and that operations would be in full blast on Monday. There is no doubt of the existence of gold in the gravel in paying quantities, and the men who have put in the hydraulic plant are workers. A number of miners are sluicing above the hydraulic company's ground, and making wages. One of them, K. B. Brown, picked up a $5 nugget one day last week. Chinese are prospecting on the creek below the government trail, and are said to be meeting with good success. About 3½ miles up the creek from the trail, F. P. Price and Roderick McLeod have two quartz locations, the May and the Jenny, which show an oxidized ore carrying free gold. The ledges are from 4 to 6 feet in width. Last month a 250-pound sample was sent out to the Spokane Falls sampling works for a test, but returns have not yet been received.

ROVER CREEK.—At the head of this stream is situated a gold district, discovered by John Wallace in the summer of 1889. On a claim called the Whitewater, he and his associates are driving a tunnel, which is now in about 100 feet. The ore, in rose quartz, gives assays averaging $100 in gold to the ton. Joe Wilson expects to begin packing ore

from the Hall mines to the landing at Nelson on Monday. An ore-shed to house it has been erected on the river bank.

GRANITE CREEK.—Kamloops *Sentinel*, Sept. 27: This creek and its tributaries continue to yield a fair golden harvest to the miners engaged in the work there. The majority of the work is done by Chinamen.

OKANAGAN.—On the Monashee mines, development work is being pushed forward steadily. A new and very complete Pelton mill has been added to the plant, and the work of reducing the ores will be carried on vigorously in future.

IRON FOR SMELTING.—J. W. McKay has received an order from the Taconia smelter for 100 tons of iron ore from his Cherry Creek mines. The managers of this smelter who have tried a sample of the ore pronounce it of the very best quality—better than can be obtained anywhere else on the west coast. Should the 100 tons ordered prove of the same quality as the first samples—and unaoubtedly it will—all the ore of this class required by the Tacoma smelter will be ordered of Mr. McKay, who has evidently a bonanza within his grasp.

LOWER KOOTENAY.—Mining in the lower Kootenay continues brisk, with excellent showings at all the camps. An American Co. the other day offered Mr. McCrae, of McCrae & Keefer, owners of the Wild Cat, 10 bond their claim for $40,000.

COLORADO.

FROM ASHCROFT.—Aspen *Times*, Oct. 1: A strike has been made in Little Monument gulch just west of town. It is off the lime belt in the fissure vein country north of the famous Montezuma and Tam O'Shanter. It was in this gulch that Ashcroft (after whom the town was named) and his partner made the great strike in the early days. They took out of the North American mine $100,000, and it is said that Ashcroft skipped out with nearly all the money belonging to his associates. He was last heard of in New Mexico, but none of the treasure was ever recovered. The North American was soon worked out, the vein going down only about 200 feet. The ore was very rich, containing much native silver, and this find gave the town of Ashcroft its first boom. The new strike is in the property owned by F. A. Kinney and others. This is under lease to George W. Lloyd and others, and they started up work only a short time ago. They have uncovered a 3½-foot vein of ore that runs 38 ounces in silver and 45 per cent lead. Ever since those prosperous days, Little Monument gulch has held a high place in the estimation of the prospector, and the present strike bids fair to bring about a repetition of those early times. Prospectors have long held the gulch, doing annual assessment work, and each one has hoped to strike it bigger than the North American.

MONTE CRISTO.—They are taking out ore here every day. The mine is improving as they go in on the drift and gives promise of a good thing. They will make a shipment of 50 tons the first of the month. This ore will go to the new Thomasville smelter, which will blow in about the last of October. The flow of water from the Monte Cristo tunnel has decreased, greatly to the advantage of working the property.

STRIKE IN THE ASPEN.—A body of rich ore has been struck in the sixth level of this mine, at a point about 100 feet north of the electric incline, the latter being some 500 feet south of the shaft. The level had been run through it, showing it to be a chimney 25 feet wide.

OREGON.

PINE CREEK MINES.—Bedrock *Democrat*, Oct. 3: A large amount of ground has been worked this season and the output has been large, as the previous cleanups, not one of which has fallen below $12,000, will attest. The Robbins plant consists of a five-foot Byam mill, with a capacity of 12 tons per day, four Frue concentrators, and other necessary appurtenances for successfully reducing the ore. The machinery is run by a six-foot Pelton wheel, under 160 feet pressure, furnishing enough power to run two plants of a like capacity. The ore is conveyed from the mine to the mill by teams. Supt. Robbins says that as soon as arrangements can be perfected he will work his concentrates at the mill instead of shipping them to Denver, as is now done. He will either employ the chlorination or amalgamation process, both of which have been tested and gave satisfactory results. The concentrates go all the way from $60 to $235 per ton. The ore is rich in free gold, and from 96 tons, eight days' run, $2000 was realized. The ledge is 14 feet wide, solid ore, there being no waste at all. A contract has been let to run a 700-foot tunnel, which will tap the ledge at a depth of 300 feet. The tunnel is now in 350 feet.

THE BAISLEY-ELKHORN MINES.—The plant here consists of two 5½-foot Huntington mills, with a capacity of nine tons each per day, and two improved Frue concentrators, the machinery being run by steam. The mill is situated about 150 feet below the mine, the ore being conveyed by a tramway. The camp presents a lively appearance, there being a large force of men at work at both mines, which are only a few hundred feet apart. The character of the ore of the two mines is somewhat different, the Baisley-Elkhorn being more of oxide formation and the Elkhorn a sulphide. Upward of a dozen buildings are under construction, and on their completion the place will take on the appearance of a veritable mining camp.

DAKOTA.

BETTER ORE.—Deadwood *Pioneer*, Oct. 1: The last cleanup at the Monitor Co.'s mill was more satisfactory than that in August, the yield being about $5 a ton. This is the first cleanup from the virgin ground opened up a short time since. The workings there now show up a fine body of good grade ore.

FROM GALENA.—The Richmond, Cora and R. B. Hayes are making regular shipments of high-grade ore. From the Queen, ore is being mined and piled on the dump awaiting better shipping facilities. The new barrel at the chlorination works is set in place on the boxes ready to revolve. It is lined with one sheet of lead 7x17 feet in measurement. This is the largest sheet of lead lining ever used in a barrel, but this is the largest barrel in use. On the dump at the works there are now ready for treatment over 1200 tons of Golden Wedge ore, and by the time the barrel will be ready that amount will be increased to 1500.

ABOUT DEADWOOD.—On the Golden Reward, 25 miners are being worked, the extracted ore being treated at the Deadwood chlorination works. This is a blanket lode, lying quite flat. Its thickness has not yet been ascertained. The ore, found from the grass roots down, occurs in chutes divided by porphyry dykes. In an open cut on the south end of the Golden Reward is a face of ore nearly 80 feet in length, and of average thickness of about 8 feet. A main tunnel about 500 feet in length has been driven from east to west, crosscutting three distinct chutes of ore and exposing the presence of a fourth chute, at which point work has been stopped and a winze started to determine the depth of bedrock. This tunnel almost crosscuts the entire distance between the side lines of the two claims forming the Golden Reward property. A large quantity of ore has already been mined from the first and third chutes, which have been stoped from the caprock down. But in the second chute only a small quantity of ore has been mined, because it carried nearly equal proportions of gold and silver, and the works at present only treat gold ore, losing the silver. The average thickness of the ore bodies in these chutes, so far as developed, is about 12 feet, while the three chutes measure a total length of about 300 feet along the line of tunnel. This ore yields an average of $22 per ton. Four thousand tons were shipped to Omaha for treatment last year, with satisfactory results.

ON THE GOLDEN WEDGE a shaft has been sunk 30 feet deep, but not to bedrock. At the bottom the deposit has been crosscut by a drift 80 feet long, 30 feet of which cut through a porphyry dyke. The ore bodies exposed so far as work goes at present, show an average thickness of about 8 feet, and the ore so far has yielded richer than the Golden Reward.

IDAHO.

ABOUT QUARTZBURG.—*Statesman*, Oct. 1: The G. & S. M. Co.'s quartz-mill is running to its full capacity and a large force of men is employed night and day, the ore produced being of the best quality. Chris. Peterson has charge of the crushers, etc., in the mill. G. H. Faul is kept pretty busy clearing away the ore as it comes from the mine.

AT WOOD RIVER.—Pat O'Donnell and Pat McMongle, lessees of the Parnell mine in Narrow Gauge gulch, have about 50 tons of ore out on the dump, of which about 20 tons are first-class, worth about $150 per ton, and are extracting more right along. As soon as they get 40 tons of second-class ore on the dump they will ship it and lay in their winter supplies, in order to open the property sufficiently to justify the construction of either concentrating works or hand-jigs next spring. The Standard Co.'s mine shows a foot of solid ore, but, although this is between the 4th and 5th levels, at a depth of about 375 feet from the surface, the developments are not sufficiently extensive to demonstrate the extent and value of the ore body.

STRIKE IN THE OPHIR.—The recent cutting of a big and rich ledge in the Ophir mine at a depth of 250 feet means the early employment of a large number of additional miners in this camp and a consequent increase of business.

FLINT DISTRICT.—*Avalanche*, Sept. 27: Work has again been started on the mines in Flint district which were purchased last year by Denver parties. A new survey has been made on the tunnel run last year and another effort will be made, through it, to reach the chimney of ore found in the shaft. A battery of 10 stamps is now on the way here to be put into the big mill at Flint by parties who have leased that property. The costly mill built there some years ago by the Flint M. Co. proved to be a very expensive experiment. The rolls with which they tried to crush the ore would not work, and the system of concentrators they attempted to operate were equally a failure. The lessees now go back to the old stamp process, and with roasters will try to work the refractory ores. The ores in the Flint mines are high grade and just sufficiently refractory to prevent good results without roasting.

RICH GOLD ORE.—Dave Farmer and Fred Grete, Jr., who have for some time been working a prospect near the head of Coffee gulch on the south side of Florida mountain, have at last struck what promises to turn out a big gold find. They have sunk a shaft 30 feet deep on what now shows it to be a true vein some four feet in width, with a pay streak in it of one foot of very rich ore. They have brought down specimens literally flecked with gold. One specimen weighing fully 20 pounds, it is claimed will run more than $1000 per ton.

MONTANA.

MINES IN DEER LODGE.—*New Northwest*, Oct. 1: The ground of the Silver Crown has all been prepared for the reception of the hoisting machinery. Part of the machinery, including the 45-horse power engine, is now on the ground, and the other machinery is arriving day by day and is being placed and put in order as rapidly as possible, and by the middle of next month the company expects to hear the rattle of the works and be sinking farther toward the center of the earth. This promises to be one among the finest properties in Deer Lodge county. The crew at the Lion has been increased. The company is still crosscutting in the 300-foot level, north and south, and is stoping and taking out ore from the 200-foot level, the assays from which are very favorable.

THE MONARCH MINE lies on the west slope of Bison mountain at the head of the Little Blackfoot and about 15 miles a little north of east of Deer Lodge. The lode has been opened by shaft and tunnel. It is the intention of the company to follow the chute of ore along the lead with the tunnel for about 150 feet, after which they will put on machinery and sink farther on the lead. There have been about three carloads of ore taken out of the shaft, one of which has been shipped and the others are now being hauled out for shipment. The carload shipped brought silver, $641.39; gold, $115.60; lead, $153.40. total, $910.39. Less freight and treatment, $261.26; net, $649.13.

ABOUT BUTTE CITY.—*Inter-Mountain*, Oct. 1: The Lexington Co. is developing the lower working, sparing neither time, money nor expense. Ore sufficient is produced above the 600 level to keep the mill running as usual. Fine-looking leads are being cut by the many sewers that are being dug through the principal streets of the city. Assays made from one cut on East Mercury returned 34 ounces in silver. The Rock Island is one of the prominent and most remunerative leases in the camp and is operated by the Voulton boys. Shipments are regularly made to the reduction works. The Buffalo continues to pump water and the drift from the mountain to connect the Buffalo property is being pushed. Some ore is being taken from the St. Lawrence mine and shipped to Anaconda. It is expected these properties will start up on a much larger scale during the coming month. The Alva has a small hoist erected on it and shipments of ore were made yesterday. The Prospect, south of the Orphan Boy, is taking out some rich ore and sacking it for shipment. The new engine-room and all the other necessary buildings, with the exception of the shaft-house, on the Germania, have been erected, and shipments of ore are being regularly made. The Blodget boys continue to have hope in the Hope, and they are developing on the 200-foot level. The Anselmo is virtually shut down. This mine has about the largest ledge in the bottom of the shaft in the Missoula gulch locality. Ernest Sticht, the assayer on Upper Main street, has made some very flattering assays of local properties the past week, all speaking well for the future prosperity of this city. Improvements continue to be performed at the Belle of Butte mine. Wood is getting a little scarce at some of the mines and it is feared by some that the fire that lately consumed in the neighborhood of 200,000 cords will have the effect of raising the price of that article in the near future. The foundation is about completed for the engine-room and the shaft-house of the Lewisohn shaft, and the buildings are fast being erected. The two Colusas and other properties of the Boston & Montana continue to work at their regular capacity.

UTAH.

WORK AT BINGHAM.—Salt Lake *Tribune*, Oct. 5: Mr. Franklin is now working 75 men and putting out, mainly from the Utah, $600 or $700 worth of ore per day. Mr. Holden has put out about 1000 tons a month from his Bingham property the past three years. Mr. Franklin regards his Bingham property as more valuable than any other in the Territory, not excepting the Ontario, the Beck-Bullion, Eureka Hill, Mammoth, or any other mine. He has the settled conviction that working is what mines require to make them profitable, and he seems to be able to command all the capital he needs.

WASHINGTON.

IRON ORE.—Colville *Miner*, Sept. 30: The Tacoma smelting and refining works are to receive weekly two carloads of iron ore from Mr. Hammond's Clugstun Creek mine, to be used for fluxing purposes. Mr. Hammond will begin to-day with teams to load the ore for shipment. He has also had shipped to the exposition two tons of ore from his properties, which will be placed in the Stevens county exhibit.

A DEPOSIT OF FIRE-CLAY has been discovered in King county on the line of the Seattle, Lake Shore & Eastern railroad, which is said to equal in quality any of England's production. A company with a capital of $10,000 is being incorporated for the purpose of developing the find, and as soon as possible will begin the manufacture of brick for furnaces and ornamental purposes.

Mining Share Market.

The market has held dull, but at slightly higher prices. The strength of the market, in the face of assessments levied each week, is a source of surprise to many, but to close observers the surprise is that more strength has not been exhibited, with prices ranging higher than for some time past. This opinion is grounded on the well-known fact that stocks have been and still are being concentrated, while the nature of the work in the mines presages important prospecting or developing work in several at an early day.

In outside stocks, Central, in the Quijotoa district, has been more active under buying orders from Arizona. The Tuscaroras have been steady, with a firm tone under light trading. The Bodies broke back under fair sales, but this (Thursday) morning Bodie made one of its characteristic cat-like moves, jumping up from $1.45 to $1.90 bid. The moves up and down in these stocks come like a thief at night—without warning.

The *Exchange*, a daily four-page paper, is launched on the journalistic sea. It is devoted chiefly to the stock market and makes quite a creditable appearance.

From the mines our advices report that the 600-foot level in Alpha, the 1000-foot level in Challenge and Confidence and the 1200-foot level in Potosi and Chollar are to be opened up. Official letters received to-day report that in Confidence they are repairing and timbering preparatory to prospecting for ore. In Seg. Belcher, important prospecting work is under way, as there is also in Overman. Connection in the Potosi winze with the Chollar 1200-foot level will be made soon, when that level will be opened up by a series of crosscuts. The Savage and Hale and Norcross letters do not contain anything particularly new. The official letter from Kentuck reports the prospects very encouraging for a development in the east drift on the 1000-foot level, and one in the west drift on the 950-foot level. Assays of ore in the latter level were as follows: Sept. 30th, $71.79 per ton; Oct. 4th, $39.29; and Oct. 7th, $52.19. But the letter fails to state how wide the vein is from which the assays were made. An assay was made on Oct. 4th, the ore of which went as high as $1079.80 per ton, but the quantity was small and coarse. The latter assay is evidently misleading.

From the outside mines the news from the Tuscaroras and Quijotoas continues encouraging. From the Bodies the news is of an exceedingly favorable character. The mill started up on last Monday. From Bodie's official letter, Oct. 4th, received to-day, we obtain the following: "We have repaired the 'Old Bodie' shaft and commenced to hoist ore. In upraise above the 400-foot level west of 'Old Bodie' shaft we have very rich ore. We are stoping out good ore on the 500-foot level Jupiter shaft. We are preparing to stope out ore north and south from No. 2 North drift, west of shaft on 700-foot level."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 30, 1890.

437,322.—LAWN-SPRINKLER—R. Addison, Pasadena, Cal.

437,548.—PACKAGE TIE—W. H. Anderson, Riverside, Cal.

437,558.—WHIFFLETREE HOOK—C. W. Blackburn, Tombstone, A. T.

437,565.—FLOWER-POT—Amanda J. Byrne, Tuscarora, Nev.

437,576.—CHECK BIT—Harris G. Cox, San Jose, Cal.

437,293.—COIN-ACTUATED TELEPHONE ATTACHMENT—H. F. Dugan, S. F.

437,300.—AIR BRAKE—L. Guillemet, S. F.

437,599.—ASTHMA REMEDY—Iselin & Callahan, Riverside, Cal.

437,494.—LIMEKILN—Wm. Jones, S. F.

437,213.—HOSE-COUPLING—B. F. Levet, San Diego, Cal.

437,499.—EXPLOSIVE COMPOUND—D. Mindeleff, S. F.

437,510.—TELEGRAPH KEY—A. F. Purdy, Lawrence, Cal.

437,511.—WATER-POWER—Quain & Warner, Albany, Or.

437,634.—CAR-COUPLING—Strathmeier & Guttenberger, Sacramento

The following brief list by telegraph, for Oct. 7, will appear more complete on receipt of mail advices:

Arizona—John A. Boyce, Phœnix, gate. California—Henry Egbers, S. F., harness tool; Charles O. Farclot, S. F., burglar alarm attachment for alarm clocks; B. Grider, La Grande, grain-cleaner attachment; Peter H. Jackson, S. F., basement and sidewalk construction; Elias Jacobs, Petaluma, safety-pocket for garments; Frank Kelly and W. A. Williams, S. F., plasterers' tools; Patrick J. Moore, S. F., oil can; Theron Palmer, San Bernardino, desk, toilet and display bottle; Francis Speed, S. F., pipe machine; William Schwabel, S. F., assignor of one-half to W. H. Holmes, Stowe, Cal., attachment for lathes; Philo N. Tyroo, S. F., bat-fastener; Marshal Wheeler, S. F., mounting terrestrial globes; William H. H. Wright, S. F., assignor of one-half to T. E. Johnson, San Jose, school-ruler.

NOTE.—Copies of U. S. and foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHECK-BIT.—Harris G. Cox, San Jose, Cal. No. 437,576. Dated Sept. 30, 1890. The object of this invention is to provide an improvement in that class of supplemental bits known as "overdraw-checks." The especial feature is the two connected bars of the bit, extending transversely across the horse's mouth, with swivel attachments for the rear bar and nose strap connection, which attachments allow the front portion of the bit to drop down and relieve the mouth of the animal from pressure as long as the head is held in the proper position.

TELEGRAPH KEY.—Arthur F. Purdy, Lawrence, Cal. No. 437,510. Dated Sept. 30, 1890. The improvements in this key lie in the employment of peculiar guides for the key lever which permit its free up-and-down movement while avoiding and preventing any lateral play; in an adjusting spring and screw located at the extreme end of the key lever, which give a nice adjustment to suit the taste of the sending operator, and in conically-shaped contact points, which avoid that common difficulty known as "sticking."

FLOWER-POT.—Amanda J. Byrne, Tuscarora, Nevada. No. 437,565. Dated Sept. 30, 1890. The object of this invention is to construct a pot which shall be light, durable, tight and capable of being opened so as to remove the contents at will. It consists of two metallic sections, each forming one-half the pot, hinged together on a vertical line at one side and having means for securing the meeting edges on the opposite side and a circular bottom, one edge of which is fixed to one of the halves and the other adapted to fit in a groove or channel in the opposite half so as to make a tight joint when the parts are closed together.

LIME-KILN.—Wm. Jones, S. F., Cal. No. 437,494. Dated Sept. 30, 1890. This kiln is specially adapted for the burning of Portland cement, clinker or other substances requiring a high degree of heat. It consists in fire-chambers having a vertical shaft in which is located an open-ended tube through which the material to be burned is dropped. This tube passes through the fire-chambers and has side openings within said chambers. A revolving cylinder feeds the material to the top of the tube, and the chimney and feed-chute are located at the outer end of this cylinder.

Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

MECHANICAL PROGRESS

Working Cast Steel.

Why It Cracks in Hammering and Tempering It and How to Prevent This.

TOMBSTONE, ARIZONA, Aug. 29, 1890.

Editor Mining and Scientific Press, San Francisco—DEAR SIR: Having vainly tried to gain information on below-mentioned subject, I come to you to see if you can help me out of the difficulties I am encountering.

You will notice on the piece of steel I forward to you for inspection a number of cracks which made their appearance on the drill from which it has been cut, being heated and hammered out. What causes these cracks? What will prevent them? The drills are used in limestone, are always washed before being heated, are plunged in a solution of salt and water, are neither heated too hot nor hammered too cold. Five different blacksmiths, some of them experienced tool-dressers, have tried to dress the drills without any of them having so far succeeded in preventing those cracks from appearing. We have tried different qualities of steel, of American as well as of English make, but always, after five or six heatings and redressings of the new steel, the cracks will make their appearance, whether stone or charcoal is being used for fuel.

You will oblige an old subscriber by kindly informing me through your valuable paper what the cause of this peculiar action of the steel may be and how it can be prevented. Hoping you will be able to assist me in this matter, I remain yours truly,

S. H. BRYANT.

We have taken the piece of steel sent us by Mr. Bryant, together with his letter accompanying it, and submitted the same to two well-known experts in all that relates to steel, obtaining from each his opinion in regard to the trouble complained of, which opinions are here given.

Ahner Dohle, a manufacturer of and dealer in steel all his life, believes the trouble is due mainly to the inferior quality of the steel used in making these drills. The remedy he suggests is, the employment of none but the best of steel in the manufacture of these and similar implements.

Capt. Samuel Tyler, an expert mechanic and practical tool-maker, while admitting the possibility of the steel used in the manufacture of these drills having been of an inferior quality, is still of the opinion that the piece of steel sent us has been overheated and partially cooled down before hammering. He says the practice of heating tools red-hot and then plunging them in cold water to harden them, injures the steel, and if persisted in, ruins it entirely. He finds that if drills heated a little above a cherry-red, and "set up" always in hammering, have the points touched in a dry mixture of horax with a little salammoniac, there will follow a rewelding of any cracks that may occur in the metal. After this sharpening the drill should be laid aside on the forge to partially cool, after which the points only should be heated to a low red heat and carefully tempered in clean water, no salt being needed. He thinks he could take the cracked drill point sent us and draw it out into a fine-tempered knife-blade.

In the fire only the best kind of coal, such as Cumberland, or charcoal, should be used. The coals of this coast contain too large a percentage of sulphur for the successful working of cast steel.

Success in the Direct Method of Making Iron and Steel.

The dream of iron metallurgists for years has been the discovery of a commercially successful process for the production of iron and steel direct from the ores. Every metallurgist knows that the best iron and steel that the world has ever seen were produced by some one or other of the wasteful and expensive direct processes that were in use in the early history of iron and steel production. The iron from the run-out fires of the Catalan forges is the very high-priced and pure iron that is used in producing the best qualities of crucible steel, while the Wootz steel of India, made by the natives direct from the ore, gives a cutting edge that modern methods have found it impossible to reproduce. But these methods are so expensive that for ordinary purposes it is impossible to use them, and hence no end of thought, experiment and money have been devoted, especially within the last 50 years, to the discovery or development of a process that would permit of the production at will of the highest grades of iron and steel, and which at the same time should be cheap enough to permit its use in nearly, if not all, manufactures demanding iron and steel.

The records of the patent offices of this and other countries show no end of patents for this purpose, but until quite recently trials of the processes on a commercial scale have resulted in commercial failure in one or more particulars.

The difficulties in the way of a commercially successful direct process have been chiefly four.

The first difficulty has been an incomplete reduction of the ore without excessive waste. This applies equally to processes where the gas has been passed through the ore body under treatment, to the retort process and to the hearth process, either with or without the canister. The ore under such circumstances is likely to come out except under conditions of practice that are extremely wasteful, only partly reduced, or some wholly reduced and some not reduced at all, making not a sponge, but a mixture of sponge, half-reduced ore and ore in its natural state, heated.

The second difficulty comes from the fact that where most direct processes are continued for a sufficient length of time to effect a complete reduction of the ore, the waste or the expense of the process is so great as to preclude its commercial employment.

The third difficulty has been that the length of time necessary for the reduction of the ore has been so great, and the output per furnace so small, that a plant to give even a moderate production would be an exceedingly expensive as well as extensive works. It would require a large acreage as well as a great number of reducing furnaces.

The fourth difficulty has been too high heat in the reducer, giving irregularity of product, if not such conditions in the reducer as scaffolding or melting, as to stop the operation.

It is evident that a direct process, to be commercially successful, must have at least four characteristics:

1st. The metallic iron in the ore under treatment must be completely reduced from its ore condition to that of metallic iron, or metallic sponge.

2d. It must not be wasteful of the metallic iron in the ore. If possible, for every 100 units of iron in the ore there must be produced 100 units of metallic iron in the sponge.

3d. It must take the minimum of time, the minimum of capital in plant and the minimum of acreage. That is, the process must not be excessive as to time or fixed charges.

4th. The conditions of heat in the furnace must be such as to prevent all danger of clogging or stopping the process either from reoxidizing the ore or from gobbing or bunging up the furnace.

So many experiments have proven such absolute failures that practical metallurgists have been inclined to question whether it was possible to find a direct process that would answer these conditions.

As to its future, if it were discovered, there could be no question. A successful direct process, successful under the conditions named above, meant a complete revolution in the iron and steel industry, and meant the production of the very highest grades of steel at prices equal, if not below, those at which the cheapest grades are produced at the present time. While metallurgists, especially those who have had any experience in the last 20 years, did not say positively that a direct process answering these conditions could not be discovered, every one, without exception, looked upon an inventor who presented them a new process in this line as a "direct-process crank." The metallurgical Thomases, when news of the appearance of a new direct process was brought to them, numbered about as many as there were metallurgists in the country. We confess ourselves to have been of this number.

Within the past six months, however, we have come to question the correctness of our conclusion, as the result of the information we have received regarding the Adams direct process, which has been tested at Indianapolis and is now being tested in Pittsburg. There is every indication that at last a successful direct process, operated under the conditions named, has been invented.

It is not our intention at the present time to give a description of the Adams furnace. We can only say here, in a general way, that the furnace in construction is approximately a small blast furnace with a regenerative checker-work on the sides. In its working, the ore under treatment is brought constantly and thoroughly under the influence of the reducing gas, the reduction being performed in a remarkably short space of time, in the most thorough manner, at a small expense and with no loss of iron.

The sponge is used in connection with the open-hearth process, practically taking the place of so much scrap iron or blooms, making the process the "pig and scrap" or the "pig and blooms."

The process shows some highly interesting results in the elimination of phosphorus, especially when low phosphorus ores and irons are used, the results in some cases with such irons being even better than the basic process. The tests of the steel also give some remarkable results.

We hope to show in the near future that Holly's assertion that open-hearth steel would be made as cheaply as Bessemer, or, as he phrased it, that "open-hearth steel would attend the funeral of Bessemer," was not wrong, and it is especially fortunate that this announcement should be made just at the time our English fellow-metallurgists are coming in such great numbers to this country.—*American Manufacturer.*

FAILURE OF STEEL AXLES ON THE EAST INDIA RAILWAYS.—In addition to what was said in this column, in our last week's issue, in regard to the failure of steel axles on the East India railways, we now add the following from a Bombay paper, which says that the complete failure of steel axles in the rolling-stock of several of the Indian railways is a serious matter between the Bengal and Northwestern, and the Bombay Baroda and the Southern Mahratta lines. There is something like 50,000 of them. These axles, which cost originally about £1 2s. 6d. each, will have to be replaced by axles of wrought iron, costing about £2 5s. each—an expenditure among the companies concerned of something like £100,000. Moreover, the discarded axles will, it is said, be valueless.

SCIENTIFIC PROGRESS.

Peculiarities of Compass Variations.

During all the centuries that the mariner's compass has aided the navigator, it has not been possible to obtain one which would point directly north or south, or of which the variations under all circumstances could be accurately known. The magnetic pole of the earth is not the north pole, and it is continually changing, steadily moving westward, though not at any rate which can be predicted from year to year. The line of no variation has worked from the middle of the Atlantic to Pittsburg in about four centuries. Then there are variations due to the ship itself, to the material of which it is built, and perhaps in some undiscovered way to the construction of the compass itself, as in some iron ships no two compasses agree. In great storms, such as hurricanes and typhoons, the compass sometimes spins around in a manner so as to make it entirely useless and to indicate that things are unhinged generally.

As magnetism and electricity are continually changing according to changing temperature, winds, storms, rains and probably locality, these variations must be expected to go on forever, and the only question is how to manage them and how to learn sufficient of them so as to be able to calculate a ship's course with practical certainty. It may be possible to measure the variation in particular ships in the localities in which they are lying, as proposed by Capt. Easterby, but who will account for variations after leaving there or under so many varying circumstances as occur at sea? There are innumerable circumstances that may cause a variation in the needle. The rays of the moon concentrated on it have been known to cause a variation of five degrees. Now, on different moonlight nights this would be different, and on cloudy nights would not be felt at all.

Other similar circumstances have their effect, and perhaps many not now known. The danger of course is when near the coast on a dark night or in a great storm, and on these occasions the compass is likely to behave itself in the most erratic manner possible. For instance, Capt. Shire of the bark Easurain, who many years ago was caught in a severe typhoon, writes: "I will mention another circumstance that may be perhaps interesting, as it was certainly new and startling to me, and that was that we could get none of our compasses to remain steady, but at every succeeding burst of the heavy squalls they spun round and round, eight points at a time, and we had no other means of steering but by the roll of the sea and the feel of the wind on the back of the head, and this continued for some time after the gale had passed and rendered the approach to the land upon any safe course very precarious."

The probabilities are that on account of the continually varying aspect of earth, sea and sky, no measure which will meet all cases can be found, and that in the future, as in the past, the safety of ships, passengers and cargo must depend on the skill and knowledge of the captain, to whose charge the vessel is intrusted. —*Exchange.*

MECHANICAL STRESS AND CHEMICAL CHANGES IN ROCKS.—The subject of chemical changes in rocks under mechanical stresses was treated recently by Prof. J. W. Judd, in a lecture before the London Chemical Society (reported in *Nature* of May 29th). The action of pressure as influencing chemical affinity and producing modifications of structure revealed by the microscope, has been the object of much experimental investigation of late years, and Prof. Judd's lecture is mainly a review of the conclusions drawn from these experiments. Two kinds of pressure are to be distinguished; first, statical pressures arising from a great mass of superincumbent rocks; second, dynamical pressures resulting in movements within the earth's crust. The tendency of pressure is to produce crystallization in cases where contraction occurs. This crystallization may, however, be unstable, as has been illustrated by crystals thrown up by volcanic action from great depths. In many cases these soon become corroded and honey-combed through chemical changes permitted by removal of pressure. Many of the recent experiments have related to the increase in the solvent action of water caused by pressure, the facilitation of chemical reactions by the presence of water and other liquids, and to the promotion of chemical changes in masses under conditions of intense strain. These and other subjects are fully treated by Prof. Judd. In regard to the origin of the heat which causes metamorphism and kindred phenomena, the author believes that it cannot be attributed to any great extent to dynamical pressures, as from the probable slowness of earth movements thus caused, the amount of heat produced seems insufficient to account for high temperatures, as the opportunities for dissipation of thermal energy are so numerous.

A 10,000 DOLLAR THERMOMETER.—"The finest thermometer in this country, and I suppose in the world, is at Johns Hopkins University," remarked Lieut. Finley, Government signal-service inspector. Lieut. Finley inspects a great many thermometers every year, and he knows something about them. "This remarkable instrument," he continued, "is known as Prof. Rowland's thermometer, and is valued at the enormous sum of $10,000. It is absolutely perfect, and so fine are the graduations on the glass that it requires a telescope to read them. There are a number of fine instruments that are rigged with telescopes, but an instrument like that would be of no possible use to an ordinary individual. It requires a scientific education in order to read them."—*Jewelers' Review.*

BEGINNINGS IN WEATHER SCIENCE.—The history of meteorology has been made a subject of investigation by Dr. G. Hellmann. He finds that it is not exactly known who first kept a regular meteorological journal; but Humboldt attributes it to Columbus on his first voyage to America in 1492, while the Italians also appear to have made daily observations from the middle of the fifteenth century. The oldest of the meteorological instruments is the wind vane. The qualities of the winds were correctly described in the periods of Homer and Hesiod, in the ninth and eighth centuries B. C., while the first arrangement for observing wind direction was the Temple of the Winds, at Athens, built about 100 B. C. Eginhard, in the reign of Charlemagne, denoted the winds by the four cardinal points. The first instrument for denoting wind force—essentially the same as the pendulum anemometer now used—is ascribed to Robert Hooker, in 1667. The absorption hygrometer was invented about the middle of the fifteenth century, by N. D. Cusa, and the first condensation hygrometer is credited to the Grand Duke Ferdinand II of Tuscany. The first continuous hygrometrical observations appear to have been by R. Boyle, at Oxford, in 1666. The first thermometer is attributed to G. Galilei, toward the end of the sixteenth century. The first rain-gauge was used by B. Castelli in 1639. The first barometer was made by Torricelli in 1643.

FORCE AND POWER are often mixed by engineers writing hastily. Force can never apply to work done, but is expressed in intensity only. The instant it acts through space, work is performed and power results. Force is a single factor, but power is the product of the two factors, force and distance, that includes time. Power is constant because a product, but force may be changed. The energy in a moving body may be made to give a great amount of force in moving an object a little distance, or its force may be very small in overcoming a slight resistance and moving it through a greater distance. The energy of the moving mass, the resistance and the power developed are all unchanged, but the force can be changed.

LONG DISTANCE TELEPHONING.—We are living in an age of wonderful accomplishments and therefore do not, perhaps, realize as we might some of the feats attained by science and inventive skill. It was looked upon as one of the greatest accomplishments of civilization when the opening of the Atlantic cable made it possible to communicate between two countries separated by 3000 miles of water in a few seconds' time, and yet we are told that a telephone line has been successfully worked between St. Petersburg and Boulogne, a distance of 2464 miles, and that Russian engineers propose talking 4665 miles. Truly the progress of the nineteenth century is astonishing almost to incomprehensibility.

HIGH ROTATING SPEED.—One quarter-inch mule spindles have been run as high as 30,000 revolutions per minute. Some one in the *American Manufacturer* claims to have obtained a speed of 500,000 revolutions a minute, whereat the editor, after questioning the accuracy of the computations, very sensibly asks: Is there any special utility in securing, even experimentally, such a high rate of rotation? Beyond the satisfaction in attaining, say, to a million turns per minute (equal to 4166 turns in the period of a watch tick), is there any mechanical or physical end to be gained by it?

FORMATION OF OZONE.—In the course of recent experiments in England, a curious effect was observed, namely, that the formation of ozone is hindered by the presence of oil of turpentine and that the electric conductivity of the air at once disappears when some of the vapor is introduced. Not only turpentine, but several of the essential oils, when acted upon by atmospheric air, transform a portion of it into ozone, and again turpentine will absorb ozone without decomposing it.

UNDERGROUND WIRES.—For some years a record of storms, magnetic disturbances, etc., has been kept at the Berlin postoffice. The results show that underground wires are much less disturbed by magnetic storms than overhead wires, while, on the other hand, accidents from lightning are much less serious in towns where the overhead system prevails.

SITTING DOWN.—An English scientific person has discovered that sitting down is an acquired habit. The majority of mankind do not sit, but simply squat, or, as it is sometimes said, sit on their heels. This position, the scientific person thinks, is the natural one, while sitting on a chair is an artificial one.

PROF. HAZEN suggests that the force of a tornado may be largely diminished by the explosion of gunpowder or dynamite, just as the waterspout at sea is diverted and broken by a like discharge of explosives.

GOOD HEALTH.

Poison Oak or Poison Ivy.

The genus *Rhus* (sumac) is a genus of many species, with a habitat worldwide, and (as is not generally known) nearly every species will poison some persons cruelly, and if they do not soon get relief they will suffer terribly. Other people may handle nearly every species with impunity and then strike one, harmless to most persons, but capable of giving them a dose long to be remembered. Some persons may be poisoned by all except the white, or staghorn, sumac. This is the only species that I have not known to be poisonous.

Of the genus in North America, the swamp sumac, *Rhus venenata*, the climbing sumac, *R. toxicodendron*, and its variety or so-called species, dwarf sumac, *R. pumila*, and its variety on this California coast, *R. toxicodendron*, var. *Californica*, are the most to be dreaded. These last three are vulgarly called "poison oak" or "poison ivy," and the first is known in the Eastern States as "mercury."

While living in the East, up to the age of 30 years, our "poison oak" there was a fearful terror to me, and caused me a great amount of suffering. Then on until I was 50 it was innoxious. The variety on this coast is exceedingly plentiful on nearly all uplands, and is closely allied to ours, but is injurious to many more persons. The first time I went among it, it poisoned me from head to foot, and so it did a friend who was with me, also a new-comer here, who could handle without harm both it and *venenata* East. It laid him upon his back in great suffering for about a week. Pioneers here say that after a time the system becomes inured to it, and it does not injure them. But it does just rap it to the thin-skinned city dudes!

Remedies.

Many simple things will relieve and cure all forms of this poisoning, such as sugar of lead, sulphate of zinc, saltpeter, and muriate of zinc in solution with water. I do not know but I have discovered the best, handiest and cleanliest of these, to wit, a saturated solution of

Saltpeter.

I asked an old hunter what he used to cure poison oak with. He answered: "I wet some gunpowder and rub it on, and it kills it on me every time, if I put it on as soon as I feel it." Thinking that the only thing in the gunpowder that would do any good was the saltpeter, the next time I got a touch, all over my face, I tried it, and sure enough I felt the pain no more, when, in a few hours, if I had not got relief, my eyes would have been swollen shut. Now I keep a strong solution of saltpeter handy in my office all the time. Saltpeter is, of course, the nitrate of potash of the drug store. Nitrate of soda would probably be just as good or better, and borax, or borate of soda, should have the same effect. But the best thing of all is a certain simple preventive; this we have, I think, in the carbonate of soda, or

Common Baking Soda.

By washing the person in a solution of this before entering the "brush," or directly on returning, no injury will result from an exposure by the most sensitive. At least an old physician of 50 years' practice where these plants were common so informed me.

I have known men who through their whole lives dared not go into the woods in summer for fear of this plant, and others who were driven from comfortable homes by it. Therefore, I have undertaken the labor of this writing, for, as before said, any one may get cruelly poisoned by it when away off in the woods, far from medicaments, and if he knows all the simple remedies, he may save himself great suffering; for this reason every remedy and palliative should be yearly published.

The poison oak of this coast region is a very neat, pretty shrub, most abundant nearly everywhere. Its flowers are very rich in choice nectar for the honey bee; the honey from it is fine and wholesome, yet it poisons me and many others when riding along the road near the bushes.—*Cor. of Forest and Stream.*

SOMETHING ABOUT WRINKLES.—The general impression about wrinkles is that they are caused by worry, but the truth is that most of them come from laughing. To know how to laugh is just as important as to know when to do it. If you laugh with the sides of your face, the skin will work loose in time and wrinkles will form in exact accordance with the kind of laugh you have. The man who always wears a smirk will have a series of semi-circular wrinkles covering his cheeks. A gambler, who is accustomed to suppressing his feelings, generally has a deep line running from each side of his nose to the upper corner of his mouth, which in time extends to the chin, forming the shape of a half-moon. A cadaverous person is usually marked with two wrinkles, one on the jaw and the other under the eye, meeting at right angles at the cheek-bones. The scholar's wrinkles form on his brow, while the schemer's wrinkles come around his eyes and look like spokes of a wheel.

HYDROPHOBIA BACILLUS.—Dr. Richard Mollenhauer of Philadelphia thinks he has discovered the hydrophobia bacillus in a dog which he had rendered rabid by innoculation. The germ was a bacillus whose various growth-stages presented a uniform type. In its adult period it was usually found in chains, typically made up of four links, rarely of three, somewhat more frequently of two, and exceptionally of five links.

USEFUL INFORMATION.

RUBBER WHEELS FOR CASTERS are very desirable, as they are perfectly noiseless and do not wear the floors perceptibly, can be used on wood, brick and concrete floors with great saving. They are particularly adapted for all kinds of mill and warehouse work, and are greatly appreciated in hotels, banks and hospitals, where noise is troublesome. The great objection to these wheels arises from the fact that heretofore they have not been well made. One way in which they have been made consists in springing a ring of rubber on to a grooved wheel, but a movement of the wheel sideways would spring the rubber off as easily as it was put on. The other method consisted in vulcanizing the rubber on, but on being used the rubber would become loose from the wheel. A new method of manufacture has recently been patented under which they are composed of two compressing metallic disks, which are provided with a section of hub, peripheral flange, and an annular rim of vulcanized rubber, which is mounted on the shoulders of the disks and firmly compressed between their flanges by means of screws, making it easy to replace worn-out rubbers, and yet rendering it utterly impossible for the rubbers to slip off, as was the case with the old methods.

ANCIENT EGYPTIAN GLUE AND VENEERING.—Among the many occupations of the carpenter, that of veneering is noticed in the sculptures of Thebes, as early as the time of the third Thothmes, whom I suppose to be the Pharaoh of the Exodus, and the application of a piece of rare wood of a red color to a yellow plank of sycamore, or other ordinary kind, is clearly pointed out; and in order to show that the yellow wood is of inferior quality, the workman is represented to have fixed his adz carelessly in a block of the same color while engaged in applying them together. Near him are some of his tools, with a box or small chest, made of inlaid and veneered wood of various hues, and in the same part of the shop are two other men, one of whom is employed in grinding something with a stone on a slab, and the other is spreading glue with a brush. It might perhaps be conjectured that varnish was intended to be here represented, but the appearance of the pot on the fire, the piece of glue with its concave fracture, and the workman before mentioned applying the two pieces of wood together, satisfactorily decide the question, and attest the invention of glue 3300 years ago.—*J. G. Wilkinson.*

A NEW AND POSSIBLY VALUABLE INDUSTRY. Quite a number of our citizens, says the Point Arena *Record*, are financially interested in the enterprise which is being established down near the port. The new enterprise promises to be of considerable value to our town, inasmuch as if it comes up to the expectations of its projectors, over 2500 cords of wood will be utilized in the course of 12 months. Large furnaces are being built, over which will be a kind of oven into which the wood will be placed. Here it will undergo a roasting process, the result of which will be the carbonization of the wood, the product being a first-class grade of charcoal. The tar—which can be extracted from either fir or oak—being rather heavy, is drained off into a retort, while the gaseous vapors containing turpentine, acetic acid and alcohol are carried off through condensing worms into vats arranged for their reception. The charcoal made from oak is of the highest value, while the tar derived is worth about $1 90 per gallon. Oak tar is used as a base for quite a number of compounds, the principal of which is a preparation used in harness and leather blacking. In another week the success or failure of the enterprise will be known, and we can then predict its effect upon our community.

PORTLAND CEMENT IN SEA-WATER.—Concerning the influence of sea-water on Portland cement, M. E Candlot says: "The nature and quantity of the water used are of influence on the setting of cement. Sea-water, by forming calcium chloride and sulphate by double decomposition of the magnesium salts it contains with the lime compounds present in the cement, retards the setting. Neat cement gauged with sea-water is at first stronger than when fresh water is used, but retrogrades after some months. Cement, when made up into mortar by admixture with sand, shows no such tendency; the use of sea-water may delay its reaching its full strength, but this is attained after the lapse of a year. This fact applies particularly to finely ground samples."

CHEAP GAS FOR FUEL.—Boston is about to try the virtues of fuel gas. The Boston Gas Company, at the North End station, have a plant embodying the latest improvement in the production of water gas from the cheapest grade of fuel. They propose to utilize one set of distributing mains which belong to the old company, and if the public takes kindly to the idea are willing to spend some hundreds of thousands of dollars. If a man living on the line of this pipe is in a manufacturing business in which he wants to melt a little metal of any kind, drive a gas engine, run an occasional stove, or do a bit of occasional cooking, he can make the trial.

THE BUILDER.

Metallic Ceilings and Cornices, Etc.

The large use of zinc and sheet and plate iron and steel for architectural ornamentation and for taking the place of plaster and wood, is one of the notable facts in connection with the architectural work of the day, especially in this country and Australia. The *Building News*, in reference to this matter, says: Cornices, window-dressings, Mansard and other roofs, dormers and ornaments are largely formed of sheet metal, fixed upon brackets to the walls or otherwise secured to the structure. Unfortunately, we have no definite information as to the durability of this sort of architectural decoration, though, judging from English experience of metal-work and zinc applied externally, there is little promise of the permanence of these appliances. In Sydney zinc appears to be used for ornamental ceilings, and a ceiling of this kind on a rather large scale has been recently fixed in a hotel dining hall at Sydney, which, for richness of ornamentation and "beauty of design," is said to be unrivaled. The ceiling is divided into 15 deep and rich panels, "handsomely decorated and gilded." The chief advantages of a zinc ceiling are that it can be soon fixed without dirt and is a comparatively light material. Certainly its internal employment is more likely to be a success than its external application. The metal can be molded into panels or coffers and fixed up in large pieces, and the material can be decorated or gilded. Molded zinc cornices can be fixed *in situ*. The acoustical properties of the material is a point that has to be tested. One thing in its favor is its durability. We are not aware that metal ceilings have been employed in this country to any extent, though there are many substitutes for plaster. One question is the fixing of the sheets and the allowance to be made for expansion and contraction. To cover old ceilings, or to prevent the appearance of cracks, the metal ceiling is well adapted, as the sheets can be easily fixed, care being taken to prevent the unpleasant rattling of the sheets from vibration or shaking of the floor.

An iron trade journal of New York says: The great consumption of iron and steel in the past year can hardly be accounted for by the increased section of the new rails specified, or by the natural demands of a growing population. A little investigation will show how iron and steel are being made into varied forms, and taking the place of wood in almost all our living wants. A step in this direction, which has as yet attracted comparatively little notice, is the introduction of sheet metals to take the place of plaster and wood ceilings, as shown in the U. S. Army Mess Hall, at David's Island, New York harbor.

Heretofore the extended use of metal ceilings has been limited by the ornateness of design, high grade of skilled labor necessary to satisfactorily erect, and consequent cost. This difficulty was solved, and journeymen carpenters picked up in New Rochelle, N. Y., who had never before seen a metal ceiling, did the Government work referred to. An inspection of the alignment of the moldings shows them to be perfectly straight, and how admirably it works with only ordinary labor. To show that it is looked at in this light, a famous New York firm of architects has specified, among the other building materials of one of their great buildings, for 34,000 square feet of this ceiling. Judging from the success in the first year of its introduction, acres of the ceiling will be used, involving tons of sheet metal, adding another great and growing field for the output of our mills.

A NEW DOOR.—Worcester (Mass.) architects are much interested in a new door recently patented by a citizen of that city. The door is an adaptation of the principle of the roller-top desk and cover, and is described by the Worcester *Spy* as follows: The door consists of a series of slats, about 1½ inches wide and three-quarters of an inch thick, joined together by wooden spindles, one revolving within another. In the roller-top desk the slats are joined by ribbons of steel or canvas. When the door is opened it is wound up on a spiral drum at top and bottom, and all is inclosed within the door casing. An ordinary three-foot door winds up in a roll seven inches in diameter. A wire or cord or steel ribbon (as the case may be) runs from the outer edge of the door at top and bottom, and is wound upon a spiral drum in the casing opposite the side in which the door itself is wound up. A three-foot door occupies about 14 square feet in swinging, when there is nothing in the way, and most city people will consider that space worth saving.

THE FORM OF A ROOF often has much to do with the draft of a chimney. The flat roof offers no resistance to the passage of air, but as the pitch is increased the current is more and more disturbed, until with a high-pitched and many-gabled roof it is broken into innumerable eddies, some of which are sure to curl down and force the smoke and gases in the fire into the rooms below. Chimneys on such roofs should be built higher than ordinarily.

ARTIFICIAL WOOD.—One of the largest buildings in Northern Germany is a new Hamburg hotel, just completed, and built entirely of paper boards compressed to the hardness of wood. One rather unexpected advantage claimed in behalf of the new building material is the circumstance that, by being impregnated with certain chemical solutions, it can be made absolutely fire-proof. The same process of manufacture also secures it against the attacks of destructive insects, and might thus specially recommend it for use in certain river valleys of the American tropics. Wood eating ants have been known to demolish large frame buildings in less than a month.

ENGINEERING NOTES.

Railway Accidents.

Lack of actual uniformity in the gauge of railways which are nominally of standard gauge is believed by many to be the cause of many otherwise unexplained accidents. It is found by Poor's Manual for 1889, that of 548 different railway companies in the United States whose tracks are nominally of standard gauge, 129 use the gauge of four feet nine inches, while 419 out of the whole number have a gauge of four feet eight and a half inches. It is well known that it is a constant custom to run the same locomotive and trains on both these gauges. A play of three-fourths of an inch is given on the Pennsylvania Central, with its gauge of four feet nine inches. Now, the trains of that road are constantly being transferred to roads of four feet eight and a half gauge, where the wheels have a play of only one quarter of an inch. Is it not more than probable that a wheel will often mount the rail and not infrequently under conditions which will endanger a derailment?

A correspondent of the *Railway Age*, who has seen much service on railways, says: "I have found the proportion of cars from roads using four feet nine inches gauge that are 'off track' is far greater than that of other cars. Within the last few months I have been to two wrecks on the road and watched the replacing of three cars off track in the yard. The wreck was caused by car mounting the rail on a cross-over. It would not curve readily. This car and two of those off track in the yard were from a road using four feet nine inches gauge."

It is certainly unfortunate that exact uniformity of gauge does not exist in this country, because while no advantage can be seen in a variation of half an inch, the disadvantage and possible danger are evident. The subject demands most serious and earnest attention. If our railroad authorities cannot agree upon positive uniformity in a standard gauge, Congress should interfere and appoint an expert commission to decide upon the matter. It would seem that a careful investigation into accidents which occur upon the different gauges ought to determine just where the factor of greatest safety lies.

The subjoined information from Poor's Manual for last year may be interesting in this connection; a careful perusal discloses the following: Seven hundred corporations in the United States use 17 different gauges varying from five feet nine inches to two feet, 419 use four feet eight and a half inches, 128 use four feet nine inches, 121 use three feet and the remaining 32 scattering. According to mileage, 77 per cent use four feet eight and a half inches, 17 per cent use four feet nine inches, 5 per cent three feet and one per cent scattering.

THE LAKE CARRIER OF THE FUTURE.—The lake-carrier of the future is foreshadowed by the performance of the new McDougall steamer, the Colgate Hoyt, which, with a cargo of 2800 tons of iron ore, recently made an average of 13 miles an hour in running from Ashland to the Soo. With this almost phenomenal cargo her draught was only 15 feet; but it is not stated whether she was laden to her full carrying capacity. However that may be, it is certain that a wooden vessel of her size, or indeed one of any other construction not modeled on the same plan, could not by any manner of means load to within 25 per cent of her cargo mentioned without a much greater displacement. When it is considered that these carriers can be built at a cost of 25 per cent below that of ordinary wooden vessels, while their capacity is in like proportion greater, the prediction that they are destined to completely revolutionize the lake-carrying trade seems not at all unlikely to be realized in the very near future. —*Superior Leader.*

NAPHTHA ENGINES FOR STREET CARS.—Inventors are just now engaged in efforts to adapt the naphtha engine, which has proven so successful in steam launches, to locomotives for propelling street-cars. One such motor has been run six months, experimentally, at Elizabeth, N. J., and is said to have developed abundant power; it was found, however, that there were certain mechanical defects which it was necessary to overcome, but which were within easy reach of remedy. The locomotive developed a speed of 12 miles an hour. Another experiment, with a similar engine, is about to be undertaken in St. Louis. The cost of operating one of these engines for a day of 14 hours, covering a distance of 90 miles, is said to be only about $1 50. The cost of the same work with horses is not less than $5. If this experiment is correctly reported, important results may be expected from the new motor.

ASPHALTUM CONCRETE is proposed for a rock-fill dam. Experience has shown that even the most violent action of water has but little or no effect in wearing away asphaltum. Would it not greatly strengthen concrete as ordinarily used?

TABLE OF CONTENTS.

EDITORIALS.—Views in the High Sierra, 231. Passing Events; The Tariff on Imported Lead-Silver Ores; The Early and the Latter Rains; Comstock Mine Management, 238 Cheap and Reliable Information for the Mining Public; The Water Prospect; A Gold-Saving Device, 239.

ILLUSTRATIONS.—Longitudinal Section of the Sierra Nevada, 231. The Broken Hill Silver Mining District, N. S. W.; Mines of the Broken Hill Proprietary Company, N. S. W., 239.

CORRESPONDENCE.—Mining Notes from Deadwood, Trinity County, 232. San Bernardino County, 233.

MISCELLANEOUS—Chicago Polytechnic Institute, Labor and Capital "Rings;" Is There Such a Thing as Luck? Beatty's Improved Steam Motor for Pumps; Silver Ore in British Columbia; Aluminium for Calking; Worthy of His Hire When He Makes Himself Worthy; The River and Harbor Bill; The Pike's Peak Railway; Sulphurets Treated by a New Free-Milling Process, 232. North Dakota Coal; Railway Earnings; Diamonds in Australia; New Mexico Onyx; Tunnelling Under the New York Narrows; Dam Failures; The Sequoia Park; The Philadelphia City Hall, 233.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 234-235.

MECHANICAL PROGRESS.—Working Cast Steel; Success in the Direct Method of Making Iron and Steel; Failure of Steel Axles on the East India Railways, 236

SCIENTIFIC PROGRESS.—Peculiarities of Compass Variations; Mechanical Stress and Chemical Changes in Rocks; A Ten-Thousand-Dollar Thermometer; Beginnings in Weather Science; Force and Power; Long-Distance Telephoning; High Rotating Speed; Formation of Ozone; Underground Wires; Sifting Down; Miscellaneous, 227.

GOOD HEALTH.—Poison Oak or Poison Ivy; Hydrophobia Bacillus, 237.

USEFUL INFORMATION.—Rubber Wheels for Casters; Ancient Egyptian Glue and Veneering; A New and Possibly Valuable Industry; Portland Cement in Sea-Water; Cheap Gas for Fuel, 237.

THE BUILDER.—Metallic Ceilings and Cornices, Etc.; A New Door; Artificial Wood; Miscellaneous, 237.

ENGINEERING NOTES.—Railway Notes; The Lane Carrier of the Future; Naphtha Engines for Street Cars; Asphaltum Concrete, 237.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 242

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 242.

Business Announcements.

[NEW THIS ISSUE.]

Metal Worker's Handy-Book—Henry Carey Baird & Co., Philadelphia.
Improved Ranch for Sale—E. M. Dewey, Porterville.
Assessment Notice—Gould & Curry Silver Mining Co.
Mining Engineer—Richard R. Hawkins, Sonora, Mexico.

Passing Events.

Consulting our correspondence and exchanges that come to hand from the fields of active operations, the mining industry on this coast is being well prospered. The continuance of dry weather, while it proves detrimental to none, favors the river-bed miner, as the water-flow diminishes so long as the rains hold off, thereby increasing his opportunities for making a good season's work.

Judging from all we can learn, the output of our bullion-producing mines will be considerably larger this year than for several years past. That the product of copper, silver and lead will show an increment over that of last year admits of no doubt.

The manner in which former Comstock managements are being criticised by the mining press of the country is causing a general awakening on the subject of the abuses practiced by parties controlling leading Comstock properties; and the end is not yet.

The political pot, which at the time of our last issue was beginning to simmer, is now boiling fiercely, bringing much scum to the surface.

The Tariff on Imported Lead-Silver Ores.

Our national law-makers are confronted just now by a very difficult and perplexing problem inasmuch as its determination, whatever it may be, will work a hardship to parties engaged in different branches of mining, and also in less degree to certain other interests and industries. We have on the Pacific Coast and throughout the mineral regions of the interior a great many silver-bearing lodes that carry what are termed the "dry ores" only; that is, ores containing comparatively little or no lead. While these ores require to be reduced by smelting, they contain so little lead that a considerable quantity of that metal has to be added to them to insure their successful treatment by that method. If this needed addition of lead be supplied in the form of ores instead of the pure metal, a great economy is effected.

Now while we produce in this country a good deal of silver ore rich in lead—that is, ore carrying 18 per cent of lead and upward—we do not produce enough to meet the requirements of our smelters. In Mexico, however, this school of ores is produced abundantly and of good quality. Knowing this, our smelters have, during the past 10 or 15 years, put up many large furnaces in Colorado, Utah, New Mexico and other of our Pacific States and Territories, the proprietors depending largely on Mexico for their supply of this class of ores, some of them having for this reason located their establishments as near the Mexican line as practicable.

For the protection of such of our miners as owned deposits rich in lead, a law was several years ago enacted by Congress imposing a duty of 1½ cents per pound on all ores imported into this country in which the value of the lead was greater than the value of the silver they contained. Under the rulings of the Secretary of the Treasury during Mr. Cleveland's administration, this class of ore was admitted into this country duty-free. Subsequently this ruling was reversed and the above duty restored, the same being now as it has ever since been collected.

As will be seen, there has, out of this state of things, arisen two conflicting sets of interests—the one represented by the miners producing ores high in lead, who desire to have this duty retained, and the other by the smelters, who seek its abrogation. If under the circumstances Congress, and even public sentiment, is in something of a quandary on this subject, it is not to be wondered at, inasmuch as the arguments on both sides seem so evenly balanced.

If this class of ores is allowed to come in duty free, the miners will suffer. If they are to be subjected to this onerous duty the smelters claim that it will ruin their business, seriously reduce railroad traffic and materially enhance the price of lead to the consumer. Moreover, they contend that it will in the end greatly hurt the objecting miners themselves, as when the smelters are closed down these men will be without an available market for their ores.

If the interests of the greater number, the smelters, the railroad carriers and the consumers, are to govern the action of Congress, then the abolition of this duty becomes imperative. If, on the other hand, the interests of the minority are to be considered as paramount, and we are going to act consistently with our high-tariff professions, then it should be retained; nor in setting down this class of miners as being in the minority is it to be understood that their number is inconsiderable or that the territory they occupy is of limited extent. Far otherwise; they count up into the thousands and tens of thousands and are scattered over our mineral domain from British Columbia to Mexico. There is not a State or Territory within the limits of this vast domain but contains countless mines rich in lead, this metal constituting in many instances their element of largest value. New Mexico, Colorado and the northwestern tier of States are especially rich in argentiferous galenas.

Now, while each party to this controversy in arguing the question at issue does so from a purely selfish point of view, there are certain collateral considerations with which each seeks to strengthen its cause. If, say the miners' other interests and industries are entitled to be protected against foreign competition, so are ours. The cost of labor in this country is three times as dear as it is in Mexico, most of the necessaries of life being with us proportionately dear. How, then, without a protecting tariff on lead, can we compete with the Mexican producer for the market for this class of ores? Clearly we cannot, and there being open to us no other available market, we must necessarily give up mining these ores, which means the abandonment of properties in which our all is invested.

Carrying out his argument to its legitimate conclusions, the lead-producing miner proceeds to point out how much all our American industries have been indebted to protection against cheap foreign capital and labor for their prosperity and progress. In the absence of such protection we might, to be sure, have been the husbandmen of the world, producing beef and pork and growing the cereals, tobacco and cotton for nations abroad and receiving in exchange therefor their manufactured goods, at such prices as they might be pleased to name. Pursuing such policy, emigration to these shores would have been restricted, our industries, little diversified, would have been few and feeble, and our people poor. That we have become a nation of many pursuits, that we have grown powerful, populous and rich, is due largely if not mainly to this protective policy of our Government; why then in this particular instance seek to reverse this policy or why except the lead miner alone from its beneficent action?

In next week's issue of the PRESS we propose to follow up this subject, presenting the arguments adduced by the other side in support of the stand they have taken upon it.

Comstock Mine Management.

The *Engineering and Mining Journal* of Sept. 25th says:

Almost from the first, "Comstock mine management" has been a synonym for sharp practices, swindling of various kinds, and even bold and open robbery practiced upon the stockholders of the mines. To such a length has this gone that for many years the constant advice given by the *Engineering and Mining Journal* to its readers has been: "Leave Comstock shares alone; for whether the mines be rich or poor, the management being dishonest will absorb all the profits and divert the assessments. The unavoidable risks of mining investments are quite great enough without adding to them dishonest management."

The above coming from the leading representative mining journal of the East, is strong language and should bear good fruit in bringing about the long-needed reform in mine management on the Comstock lode. Comstock-mining officials in this city claim that everything in the mining and the milling of ore is conducted in an honest and straightforward manner. This assertion is open to challenge as long as the superintendents of the mines are not made to conform to the law in giving full details of the work done in the mine, ore found, extent and assay value, quantity of ore sent to mill, from what level, and its assay value; also the battery assay when milled. If this information is furnished by superintendents, then the officials in this city are at fault, for the reports are not posted or filed so stockholders can have access to them. The weekly letters are posted or filed, but they are made conspicuous by the absence of information such as the law calls for. It can be asserted without the fear of contradiction that if the mines are honestly worked, then the officials would not fear to give full and explicit information, such as the laws of this State demand shall be made of all work going on in the mines, together with the milling of ore.

The suit brought by M. W. Fox, chairman of the Executive Committee of the Mining Stock Association, against the directors of the Hale and Norcross Mining Company, charging misappropriation of funds, will, without doubt, throw considerable light on mine management as conducted on the Comstock lode. This suit will be watched with the keenest interest by all mining men, for it is conceded that a very thorough searching legal investigation will be made to substantiate the charges of the plaintiff, while the defendants will leave nothing undone to prove their innocence.

While this suit is in progress it is still in order to keep informed upon what is going on in the Comstock mines. The latest development is a report published in the Carson *Appeal* that the Douglass mill is working 100 tons of tailings and slimes daily, while the Morgan mill is working 200 tons daily. Few, if any, of the stockholders of the mines to which these tailings and slimes belong are aware that their property is being diverted into bullion and the bullion confiscated.

The Rock Point mill, which has a large quantity of rich tailings and slimes belonging to the Savage Mining Co., an incorporation of this State, is reported by the *Lyon County Times* to be making arrangements "to work the slimes and tailings that have been accumulating for years past. * * * A tramway has been built to facilitate the conveyance of the material to the mill from the reservoirs, and work will soon begin. These tailings," the *Times* continues, "are reported to be quite rich." It is clearly the duty of the Directors of the Savage Mining Co. to issue an injunction against the mill company who leased the Rock Point mill, and when the slimes and tailings are worked over to see that the bullion goes to the credit of the Savage Mining Company. Stockholders in the latter company should insist that their property be converted into bullion for themselves and not for the mill ring. The mill company was paid $7 per ton to reduce the Savage Company's ore to bullion and not to run a very large percentage (nearly one-half) of its value off into slimes and tailings. The former company should be forced to keep theirs and return all bullion to the latter company for stockholders' benefit.

The idea of a mill company returning only about 64 and 65 per cent of their battery assay to stockholders when Comstock ores can be and are worked, when desired, to 85 per cent! Now, as the difference between the mine assays and battery assays would cause a loss of at least 20 per cent more, the *Lyon County Times* is quite correct in saying that the slimes and tailings "are reported to be quite rich."

This slimes and tailings business is getting to be an outrage on stockholders in our mines. It is certainly time that directors of companies, presumed to be holding positions of trust for all stockholders, should be forced to do their duty. In this case their duty is clearly outlined. They have paid the man or men who contracted with them to work the Savage Mining Co.'s ore, $7 per ton. Their part of the contract has been fulfilled. It is their duty to see that *all* the bullion taken from the ore delivered to the mill under this contract (it matters not whether the contract be verbal or otherwise, in their official capacity as trustees for stockholders it is a contract) be returned to the Savage Mining Company to be shared in by all stockholders. If they refuse to do their duty, the directors of the said company are simply inviting legal inquiry which may end in something besides a mere action to recover property.

The Early and the Latter Rains.

The rain, which commenced on the 28th ult., was general throughout California, having been confined to that and the following day in some sections of the State, while in others it held on raining more or less for four or five days. While the precipitation in a few localities amounted to as much as 2½ inches, it did not generally exceed half an inch, being even less than that in most places. As a rule, this, like all premature and unseasonable rains in California, did more harm than good. It injured the grapes still on the vines, the unpicked hops and berries, and the raisins in process of curing some harm being also done to the dry grass and the sacked grain left uncovered or but partially protected. The only good that resulted from this rain was the laying of the dust, thereby rendering everything more cleanly, and travel more comfortable. But despite such small benefits nowhere did this rain meet with hearty welcome.

While some affect to see in these early rains the indices of an early or a late, a wet or a dry winter, as the case may be, they really seem to have no significance one way or the other. They have preceded some of our wettest just as they have preceded some of our driest winters.

Ever since our people came to occupy California we have been trying to obtain some clue by which to predict the character of our winters. We have consulted the Indian and studied the habits of the provident chipmunk and the sagacious woodpecker, but as yet to little purpose. During all these years we have been seeking a sign, but no sign has been given us save the sign of the prophet Jonah, and that has proved of hardly more use than the signal service, which presumes only to prognosticate the weather from day to day. We have need of something more far-seeing than this—something that will denote, if not the date of its advent at least in a general way the more notable meteorological features of the coming winter. When will arise the sage who will be able to supply this desideratum? What a boon would it be to the shiftless grain-grower and the slothful grape-picker, could they be duly advised as to the advent of these early and these latter rains!

Cheap and Reliable Information for the Mining Public.

In answer to note from "Old Subscriber," Sonora, we would say, much, if not all needed information on the subjects about which inquiry is made will be found in the Sixth Annual Report of the California State Mineralogist. On page 92 of that volume commences an illustrated article relative to the concentration of gold and silver ores on the Pacific Coast. On page 119, same volume, appears an article on the chlorination of auriferous sulphurets, this having been prepared by the State Mineralogist, Wm. Irelan, Jr.

Guided by the information and directions contained in these papers, the intelligent metallurgist and millman could not go far wrong in the matter of choosing and running a concentrator, nor yet in treating the concentrates by the Plattner process, as latterly improved and here recommended. While the State Mineralogist does not in this paper treat the subject of chlorination in an exhaustive way, he still gives such general instructions as meet the main difficulties, referring at the same time to the flow of the mountain streams has been phenomenal.

As a consequence, the big reservoirs in the Sierra, filled before the spring was half over, have so withstood the drain upon them, that none have since been entirely emptied. The most of them are, in fact, quite full at this writing, the water, in some instances, pouring over their dams and running to waste. Not, as in 1889, have either the placer or the vein miners suffered from want of water. Very few if any of the quartz-mills have, this year, for the above reason, been forced to suspend or even curtail operations, nor will this now happen to any of them. Their continuous running is assured, now that the shorter days and longer nights, with some rain in the mountains, have come. Even should the incoming year prove a dry one, the miners will not be likely to suffer seriously from water shortage till it is more than half over, if at all, there being still a good deal of last year's snow in the high Sierra.

The Broken Hill Mines.

The mines of the Broken Hill Proprietary Co. (Limited), Barren Ranges, New South Wales, are among the most extensive in the world. The operations of the company for the last half-year show a profit of £514,872 9s. 1d., and after deducting £45,594 8s. 7d. for depreciation on the whole of the various plants, dividends amounting to £464,000 have been paid, or equal to 11s. 7 1-5d. per 8s. share for the six months.

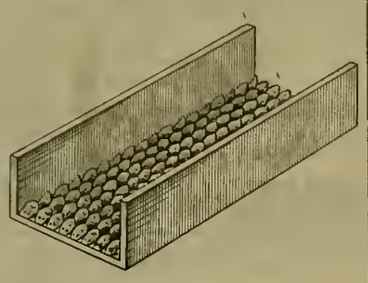
During the past six months there has been extracted from the mine 103,399 tons of ore. This has been treated in the ore-dressing plant and in the furnaces. The total quantity of ore smelted (net) has been 80,127 tons, yielding 3,814,486 ounces of silver and 15,400 tons of lead, or an average of 47.60 ounces of silver and 19 per cent of lead to the ton of ore. This has been mined and put into the surface bins at a cost of 17s. 8½d. per ton, including all dead-work and underground development work.

The mine employs altogether 2309 men, of which 1513 are in the mine itself. The furnace plant consists of 13 large furnaces with a weekly capacity of 4500 tons of ore. They have a large refinery as well as lixiviation works. The concentrating works handled 28,404 tons of low-grade lead ores in the last half-year. John Howell is the acting general manager, Wm. Harper mining manager, and H. H. Schlapp the metallurgist. The cuts given herewith show the plan of the Broken Hill district and the works of the Broken Hill Proprietary Co.

A Gold-Saving Device.

Charles Trafton of Yankee Jims, Placer Co., has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a novel concentrating or gold-catching surface, which is shown in the accompanying cut.

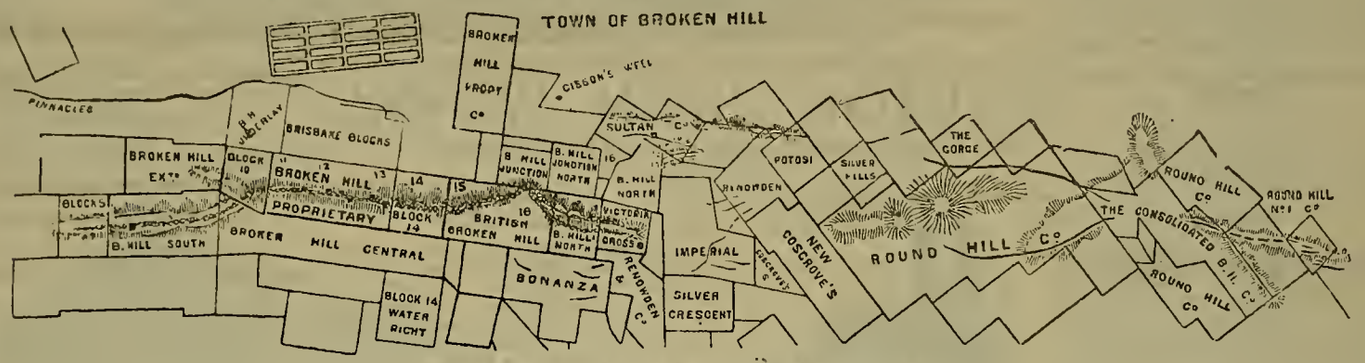
A frame or table is made suitable to fit in the bottom of a sluice, and over this frame or table are nailed or tacked the scales or cones of any tree of the order of coniferæ. For some work, as, for instance, for coarser material, the scales of the larger cones are used, such as are borne by the digger and the sugar pine. For lighter work the scales of smaller cones can be used, as of the spruce, and in some instances the scales of the cones of the fir and hemlock. These scales are closely set over the surface of the frame or table, somewhat after the manner of shingles, though not necessarily in the regular rows or lines of shingles, but in such sort as to fully cover the frame or table surface, the scales overlapping each other. They may be secured upon a perfectly plain surface, or upon a surface formed with inclines. In either case, on account of the peculiar shape of the scales, they do not lie flat and close upon one another, as do shingles, but their free points or ends are separated from the bodies of the scales which they overlap, and especially is this separation noticeable where the scales are set to break joints, as it were, in succeeding rows, because of the lateral convexity of the scale, a space being left between the points of the overlapping scales and the meeting edges of the underlying scales. This separation is more noticeable, however, in the form here shown, where the scales are attached to inclines. The surface thus provided is a very rough one, having deep interstices and spaces. The utility of the surface for the purpose intended lies in this fact to a great extent, as the heavier particles are caught in the interstices or spaces between the scales, which thus form riffles, while the lighter particles are washed off, it being understood that the table or frame is a washing-table, and water is to be used in connection with the ore. The water and ore flow over the surface in a direction against the raised or free ends of the scales.



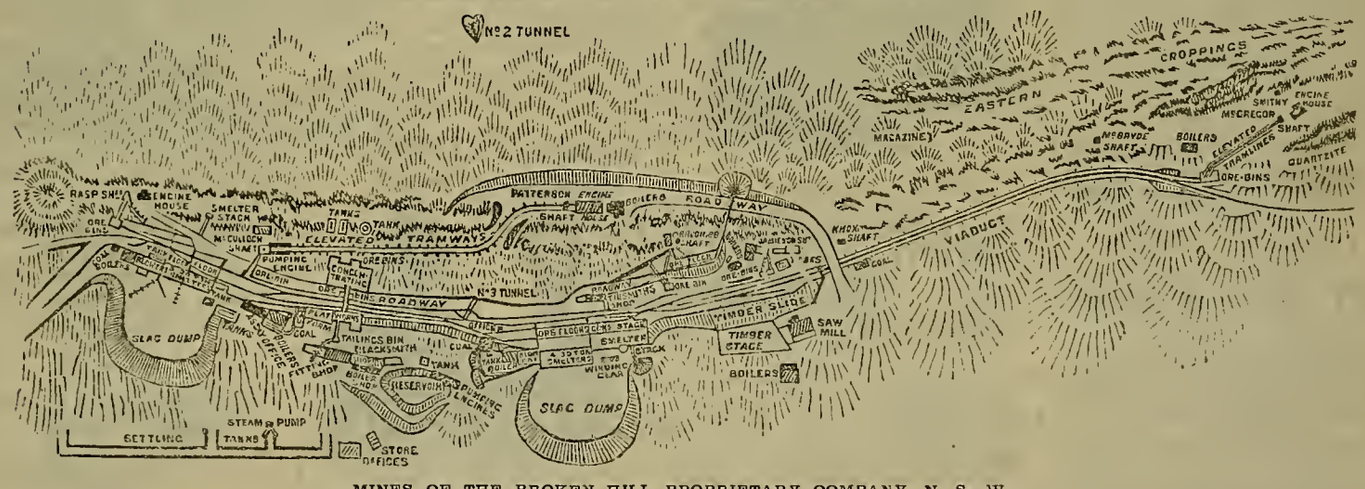
TRAFTON'S GOLD-SAVING DEVICE.

The table or frame which is here shown is intended to be one of a series of similar tables or frames to be placed in the sluice; but it is obvious that the same surface may be made within a properly or differently constructed frame having sides sufficiently high to form a channel for itself. The utility of this surface is not confined, however, to its roughness, but is due also to a peculiarity of the scale which develops itself after wear.

The upper or outer surface of the scale has a skin, which upon exposure or by reason of friction and wear breaks off in scaly bits, leaving underneath a fibrous kind of body, which serves excellently as a concentrating surface on account of its roughness. It is therefore a fact that after the scales have been in use for a time the skins peel off and wear away, leaving this



THE BROKEN HILL SILVER MINING DISTRICT. N. S. W.



MINES OF THE BROKEN HILL PROPRIETARY COMPANY, N. S. W.

more elaborate and what are considered authoritative works on the subject.

Pertinent to the matter in hand, it may be stated for the further information and guidance of the mining public, that in the series of volumes emanating from the Mining Bureau there will be found elaborate papers treating of almost every topic connected with the business of gold and silver mining. While the earlier issues of this series can no longer be obtained from the Mining Bureau, those of more recent date, being also those of the greatest practical value, can be had on application to that institution, the applicant paying postage, which, on the Reports of 1888 and 1889, amounts to 23 and 12 cents respectively.

The Water Prospect.

After a season of more abundant water supply than usual, the chances are that our miners will not suffer any water dearth for the remainder of this year, nor yet, perhaps, for another year to come. The bountiful precipitation of the past winter, snow on the higher mountains and rain at lower altitudes, insured such a water stock at the beginning of the dry season as we never before had. The ground, everywhere supersaturated, has retained throughout the summer more moisture than usual. The springs have ke full an

For Illegal Timber Cutting.—A dispatch from Tucson states that Daniel Ross, a millman of the Copper Queen Mining Co., has been arrested by U. S. Marshal Paul for cutting Government timber. His bail is fixed at $10,000. A civil suit will be commenced against Ross and the Copper Queen Co. for $90,000. It is alleged they have cut 3,000,000 feet of lumber.

The total wages paid to Wisconsin factory-employes in 1889 was $30,169,453—an increase of $3,169,299 over the year 1888.

Ground was broken at Sacramento Sept. 30th for the new Government building, to cost $300,000.

A New and Splendid Companion to all the Metal Industries.

Fully abreast of the latest inventions and discoveries, as well in the largest and coarsest as in the smallest and finest of metal work.

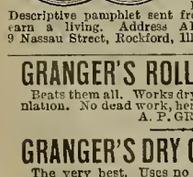
THE AIR BRUSH



Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MFG CO., 9 Nassau Street, Rockford, Illinois.

GRANGER'S ROLLER STAMP MILL
Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR
The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths. STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

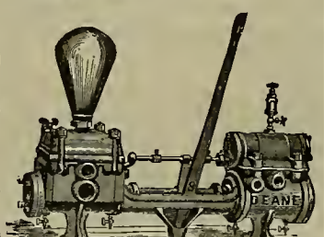
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.



DEANE STEAM PUMP.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 9, 1890.

General trade continues active in all lines. More is doing in mining machinery than for several years past. Money is growing easy with us under free remittances from the interior and only a fair demand. The East reports a growing ease in the money market, which reflects itself on ours.

There is complaint that the Treasury purchases of silver are not telegraphed. It is claimed that they are not made public. If this be so, the secrecy cannot he condemned too severely. A leading representative financier has just returned from New York, and informs us that the silver market is run by rings, but whether the Treasury is in it, no one appears to know.

MEXICAN DOLLARS—The demand is only fair. Quotations range from 88 to 89 cts.

SILVER—The Mint's counter rate is $1.12. The last telegraphic report of purchases at Washington was on Oct. 3, and is as follows: "The amount of silver offered the Treasury to-day was 957,000 ounces, and the amount purchased was 510,000 ounces, as follows: Forty thousand ounces, at $1.1345; 100,000, $1.1.37; 65,000, $1.1375; 50,000 $1.1380; 20,000, $1.1384; 180,000, $1.1385; 55,000 $1.1386." Public quotations posted by New York speculators are below Mint purchases for round parcles, and so is the price paid by the Mint or Department for small parcels. The Mint or Department, by having the counter rate low, plays into the hands of the speculators. A London cablegram, Oct. 7, says: "Ottomar Haupt prints in the London *Economist*, in a recent number, his estimate of the consumption of silver in the immediate future, which he thinks will be 4,500,000 kilos. He says silver is sure to rise sooner or later to 129."

QUICKSILVER—The market is strong at current quotations. The demand is fair. Receipts the past week aggregate 344 flasks.

LIME—Receipts the past week aggregate 3784 bbls., and exports by sea 75 bbls. to Honolulu. The demand continues fair. The buying appears to be largely from hand to mouth.

BORAX—Receipts the past week aggregate 200 ctls. The market is quiet but steady.

ANTIMONY—New York advices report the market gradually settling.

LEAD—The market is strong at higher quotations. Quite a consignment came to hand the past week from up north.

IRON—The market is steady. The consumption is increasing. Eastern advices report a strong market, while English advices report the market easy, principally due to the tight money market.

COPPER—The market is reported steady. The English market eased off some under realizing sales and a tight money market. The consumptive demand is reported to be quite heavy.

TIN—The market for pig abroad is lower and our market must follow. The action of Congress keeping pig tin on the free list, while increasing the duty on tin plate, is not calculated to encourage the tin-mining industry in this country. In tin plate from 97 to 98 per cent is still or iron plate and the other 3 or 2 per cent is tin, so that the latter gets very little protection.

COAL—Imports the past week aggregate as follows: Tacoma, 4700 tons; Seattle, 7095; Newcastle, N. S. W., 1046; Comax, 4300; Nanaimo, 1800; Departure Bay, 1214; Coos Bay, 1170; Swansea, 2311. Total, 22,590 tons. The quotations for several kinds are advanced. Large dealers report the market very strong and favorable to further advances in the near future. No vessel has left Australia for this port within a month past, while English cargoes are distant. We have the coast collieries to look to for winter supplies, and it is quite likely they will not scruple to get every cent they can. If prices are run up too high, it will encourage imports from other sources.

COKE—Imports the past week aggregate 294 tons from Swansea. The market is barely steady.

Assessment Notices.

GOULD & CURRY SILVER MINING Company.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 16th day of September, 1890, an assessment (No. 65) of Thirty Cents (30c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 13th day of November, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

DELINQUENT SALE NOTICE.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Loca ion of works, Placer county, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 19) levied on the 26th day of August, 1890, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Buffington, J M, Trustee	496	500	$ 30 00

Transfer Books close October 6, 1890, at 3 o'clock P. M.

F. B. PRITCHARD, Secretary pro tem.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

THE TWENTY-FIFTH
INDUSTRIAL EXPOSITION
—OF THE—
MECHANICS' INSTITUTE, 1890,
Opens Sept. 18th, Closes Oct. 25th,

With a grand display of Inventions, Manufactures and Art. The Latest Novelties and Improvements in Electricity will be made a special feature, including the celebrated Edison "Tower of Light." The Music will consist of a band of 42 talented musicians, supplemented by the best Vocal Talent obtainable. Miss Mathilde Lonnon, a noted Contralto Singer from London, and late from Boston, has been engaged, as also Miss Pearl Noble, the accomplished young Californian Cornetist. The Art Gallery, 800 feet long and 50 feet wide, will be filled with rare and beautiful works by local and foreign artists, in oil and water colors. Photography will be shown in the most attractive form by Professionals and Amateurs. Machinery of all kinds will be in operation, and many novelties exhibited for the first time.

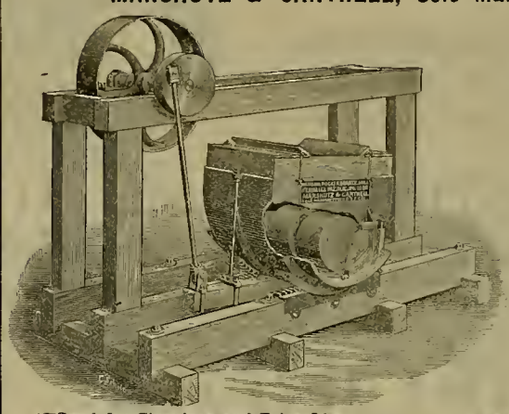
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

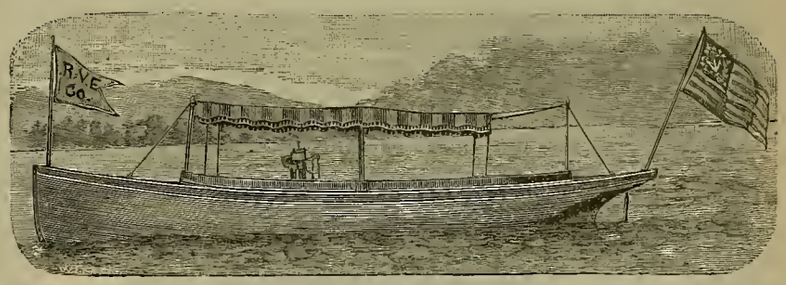
GEORGE HAAS, 324 Market St., Phelan Building, }
SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do e my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.

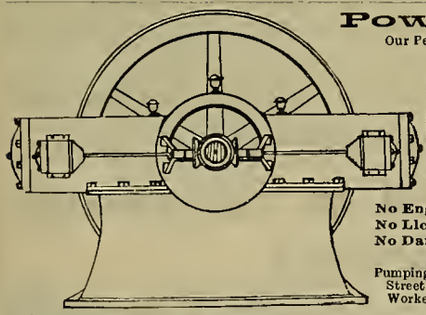
Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

REGAN VAPOR ENGINE CO., 221-223 First St., San Francisco, Cal.



Power In or Out of the Shaft for Miners!

Our Perfected "Safety" Engines cost to run only 6 cents per working day and upward; they make their own vapor, and REVERSE instantly.

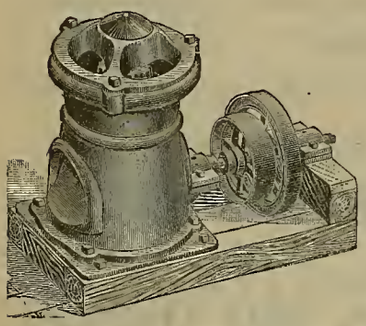
GATES ORE AND ROCK BREAKER



UPWARD OF 2000 NOW IN OPERATION.

Guaranteed to do More Than Twice the Work of Any Other with the Same Cost in Wear.

The Gates Crusher having come so largely into use in all the Pacific Coast States, as well as in other mining regions, ample opportunity has been afforded for comparison, with the result that it has an admitted superiority for all such service. Wherever used in connection with the reduction of ores, the advantages have been so apparent, and the resulte so extraordinary, as to justify the belief that it will soon become a neceeeary part of every mill equipment, even to the discarding of all other styles of crushers now in use.

The most important feature of this Crusher is its capacity for fine work, it being poss.ble with any size machine to bring the product down to cubes that will pass a $\frac{5}{8}$" or $\frac{1}{2}$" ring. By this means, the output of a mill is increased from 25 to 30% without additional cost.

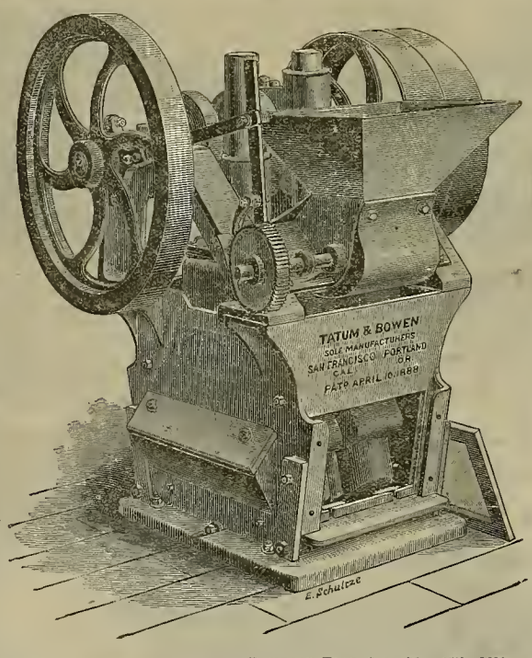
—THE—

PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Fraucisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

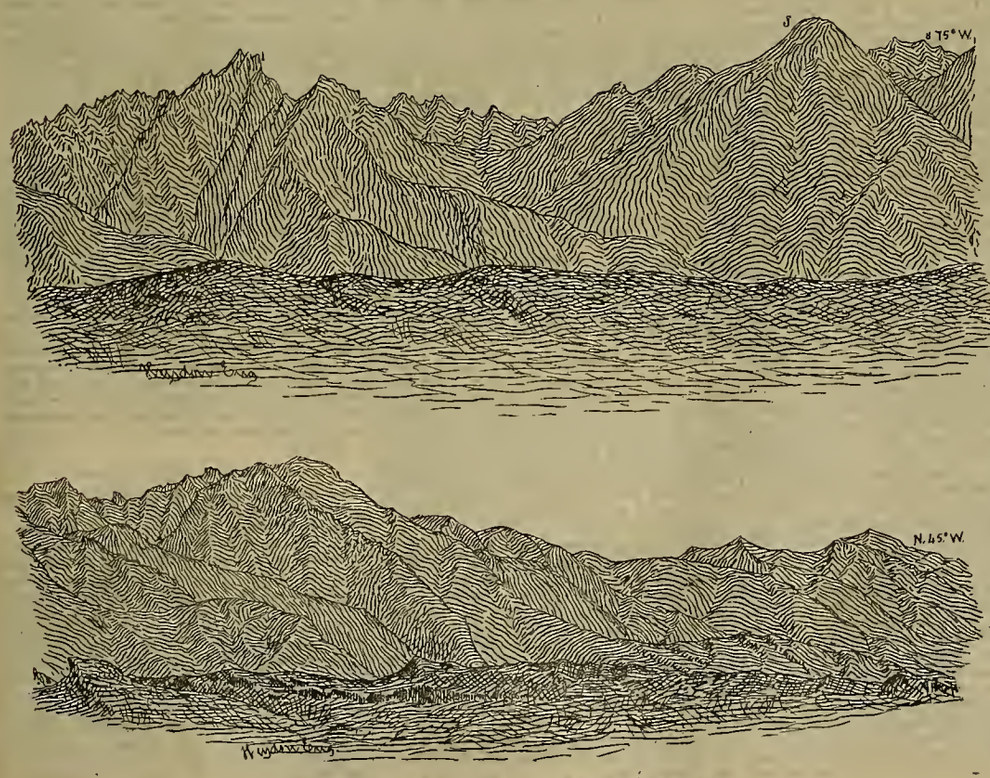
CALIFORNIA STATE LIBRARY

Farther North Along the "High Sierra."

We give herewith four additional cuts representing a portion of the "High Sierra" lying to the north of the section, in like manner illustrated in our issue of last week. While none of the peaks shown in this portion of the great California Cordillera are so high as some of those farther south, they are, nevertheless, very lofty, their altitudes varying from 12,000 to 14,000 feet above the level of the sea, their summits being from 8000 to 10,000 feet above the plain of Owen's valley, skirting this section of the Sierra on the east.

Returning to Mt. Whitney, shown in one of the cuts presented by us last week, it may be observed that a deeply serrated ridge extends southwest from that eminence for a distance of several miles, the sharp and splintered pinnacles standing along this ridge lifting themselves for 1000 feet or more above its crest. Some of these pinnacles run to a point so acute that it would seem as if a human being, could any ever reach their apex, would hardly find room to stand upon it. But this is a test of their standing capacity which none—not even the most adventurous and daring—will ever be able to make, so nearly do these pinnacles approach the perpendicular on every side. The gorges that separate these pointed and far uplifted spires are utterly impassable, there being not a spot along their sides where even the mountain sheep, the only dwellers among these crags, could gain a foothold. Originally these tall and slender spires consisted, no doubt, of great granitic shafts shoved up from below by volcanic, earthquake or other dynamic force, having afterward weathered into their present forms.

Turning and looking toward the southeast, there is seen another series of these spectral forms standing sentinel along the rocky rampart that stretches off in that direction. They do not look so frightfully steep as those on the left, and yet, perhaps seen from some other point of view, they might appear just as precipitous, these crested summits of the Sierra taking on sometimes a strangely different form when looked at from different points of the compass. Because of its serrated outline, this has sometimes been called the "Saw Tooth" range.



LONGITUDINAL SECTION OF THE HIGH SIERRA.

East of and nearly in front of Mt. Whitney stands a great eminence known as Lone Pine Peak because of the good view that can be had of it from that place. Viewed from the valley, this peak appears to be taller than Whitney itself, though it is not, in fact, so high by many hundred feet.

The Great Iron Producer of the Future.

As the United States has already become the largest consumer, so is it likely to become the largest producer of iron in the world. Edward Atkinson, in a paper recently prepared by him, remarks that, by reason of the proximity of the ores and coal in this country, as against the long haul of ores or their transportation from Spain and Africa to Great Britain, and the increasing depth and consequent heat of the coal mines there, it is probable that iron and steel can be made in this country as cheaply as in any other, notwithstanding the high wages we pay for labor. That writer is of the opinion that the consumption of iron and steel will for the next ten years fully tax the productive capacities of all iron-making countries to keep up with it, and hence that the prices of these commodities, while they may meantime undergo slight fluctuations, will be well maintained. He holds that of the present world's production of pig iron, amounting to 28,000,000 tons, this country makes now about 10,000,000 tons, an amount that will within the next ten years be increased to 44,000,000 tons.

DEEP SHAFTS.—It has generally been supposed on this coast that the deepest mining in the world has been done on the Comstock lode; but this is a mistake. In Bohemia a shaft has been put down to a depth of 3546 feet and another to a depth of 3509 feet. In Prussian Saxony there is a boring which has been carried downward to the depth of 5736 feet,

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mad Mule and Other Mines.

EDITORS PRESS:—The so-called Mad Mule mine is situated about five miles north of Stella, and consists entirely of seam diggings. It was located some 20 years ago by Mr. Banghort, whose name for a long time it bore and who, working it for several years, made a fortune out of it. Finally, however, he gave it up, supposing it to be worked out. Other parties taking hold of it have since that time worked it with varying degrees of success. The present owners have been operating it for about a year and a half, and have pursued a course different from that followed by former owners, and in this conrse they have heen successful from the start, the mine being now a fine-paying property. The gold taken ont here is porons and light. There have been run in this grounds some eight or ten miles of tunnels. The best-paying pan of quartz taken out here yielded about $1400 worth of gold.

The Iler Brothers from Sacramento, who have been mining in this vicinity the past two years, have struck rich ore in the White Rock ground, near Iron Mountain district. They have run a tunnel some 200 feet and found a fine body of ore, which shows well in free gold and sulphurets. There are two other ledges on this claim on one of which they had sunk a shaft some 75 feet. This shaft has been full of water all summer, but the tunnel since run has drained it entirely. These ledges undoubtedly come together about 200 feet from the end of tunnel. These boys expect to have a mill in operation on this olaim some time next spring, going on and developing the lode meantime as fast as possible. J. D.

Shasta Co, Cal, Oct. 4, 1890.

Evading the Law.

EDITORS PRESS:—I wish to oall your attention to the loose manner in whioh our mining laws are being carried out, the way in which claims are located and held, practically defeating the intent of these laws.

There is, for example, one man in this county who has more than 60 claims located, and I am confident that he does not do $60 worth of work per annum on the entire number. Now if we had a law requiring each locator to make oath to his assessment work with one or more witnesses, it would stop parties who run around and locate the whole country and do nothing. True, they cannot lawfully hold such olaims, but few people care to try and rectify this abuse at the peril of having a lawsuit on their hands. Hence this unlawful practice is tolerated to the detriment of honest and legitimate mining. PROSPECTOR.

Shasta, Oct. 8, 1890.

A NEW TAMPING MATERIAL FOR BLASTING. Rossiter W. Raymond, in the New York *Engineering and Mining Journal*, has the following suggestion concerning the best material for tamping drill-holes, which ought to be of great interest to miners in the Kootenay Lake country. The variety of tamping materials employed in blasting is very large, and the subject has been discussed many times; but I do not remember having seen any mention of a material lately suggested to me by A. Mezger, a mining engineer of great experience and skill. I refer to jig tailings about one-quarter-inch in diameter of grains. Mr. Mezger says that this crushed and sized material works much better than sand, packing without any ramming, so as to make a good tamping even for black blasting powder. The application is very simple. Into holes inclining downward more than 40 degrees the tailings are charged with a funnel; for holes nearly level or inclined upward, they are filled in cartridges of one thickness of paper, which burst asunder when only slightly pressed with a tamper. The effect is always satisfactory; and as there is no pressure on the primer, this tamping material is especially to be recommended as diminishing danger in the use of nitro-glycerine and its compounds. Mines where concentration works are in operation can easily be provided with the material in abundance.

FOREIGN COIN VALUES.—A telegram received lately by Collector Phelps of the Customs Department from O. L. Spaulding, Assistant Secretary of the Treasury, is as follows: The department circular of the 1st of October proclaims values of foreign currencies as follows: Austrian florin, 42 cents; peso of Central American States, 85 cents; Shanghai tael, $1.25 6; Haikwan tael, $1 40; Mexican dollar, 92 3 cents; Russian rouble, 68 cents; Japanese yen, 91.7 cents, and other silver currencies in the same proportion. The circular will be forwarded as soon as printed.

SILVER LEAD MINES WORKED BEFORE CHRIST.—Talk about the silver-lead mines of this country lacking permanency bring to notice the famous silver-lead mine of Laurium in Attica, Greece, that was being worked over 400 years before Christ, and was then probably several hundred years old. It has been worked more or less ever since, yet it is still being mined so successfully as to pay regular dividends.

The Gold Belt of California.

Ancient River Channels and Gravel Deposits.

NUMBER IV.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON of Kernville, Cal.]

The system of "dead river" channels which has made the term "blue gravel" so famous in the northern part of the State is thus seen to have extended uninterruptedly through the counties of El Dorado, Amador, Calaveras, Tuolumne and Mariposa. There are also large deposits of ancient gravel in Fresno county, but these, like those mentioned in Kern county, may belong to a more recent system.

While there are no lava-capped gravel ridges on the western slope, in Tulare and Kern counties evidence is not wanting that this region had its ancient system of rivers. East of a creek put down on the Government charts as Lime creek, but usually called Dry creek, and which puts into the Kaweah river, in Tulare county, and in Tp. 14, S. of 27 E., at an altitude of about 4000 feet above the sea, large numbers of water-worn pebbles are found on the points of the ridges, and the granite bedrock is soft and highly oxidized, as if once the bed of a stream. The same conditions are met with at Wagy Flat, west of the forks of Kern river, in Kern county, at an altitude of 3500 feet above the sea and 1000 feet above the great mountain-locked valley of the South Fork.

As I have before indicated, these ancient channels appear to have debouched upon the points of the ridges at an altitude of 2000 feet above the sea. Only a portion of them have been thoroughly tested for gold. The spurs of the ridges, marking the terminal point of the great flow which came down beneath the Emigrant Ridge east of Placerville, have been worked under the names of Coon Hill, Cedar Hill, Spanish Hill, Negro Hill and White Rock; but these workings are like the skirmish line in front of an army before the line of battle has been drawn. The great reserve of those placers is in the Emigrant Ridge. For 15 miles a high rimrock on the north of this channel intervenes before reaching the bluffs of the South Fork of the American river, and drainage in that direction would be costly. To the south, the channel of Weber creek is too shallow to offer successful drainage for more than a short distance. Hence the workings are liable to progress inch by inch from the Hangtown Creek base. This channel had its source somewhere in the vicinity of Little Silver lake, some 30 miles east of Placerville, and crossed the present line of the South Fork near a point formerly known as Bartletts Bridge.

I do not claim that these ancient gravel deposits were equally rich in gold throughout their whole length. On the other hand, the local characteristics in crystallization, when the gold is of the same value, speak of the supply as having come from lateral sources; but for miles above Placerville this channel must increase in wealth as the source of supply is approached.

A channel in all respects similar to this puts down to the south of the Middle Fork of the Cosumnes. Though I mined here for three years, I never saw a miner who could tell whence this channel took its source, and at its terminal point I suppose it is scarcely prospected to-day, though the placers of that locality are known to have drawn their supply of gold from it.

Still another channel of this kind puts down in the south of El Dorado county, by Indian Diggings, but this I have never followed for any great distance.

Probably as much wealth lies buried in the channel which puts down to Volcano, in Amador county, as there is in the Emigrant Ridge; but here again my explorations have been out short.

In the mining region of Calaveras county, the lava-capped hills are a marked feature of the landscape.

South of the North Fork of the Stanislaus, in Tuolumne county, there is a long stretch of cement covered channel, which, as I believe, remains without a single prospect-hole to-day. This channel must have crossed the present line of the Stanislaus somewhere in the direction of American Camp, and must have joined the flow from Murphys near Columbia.

The main Tuolumne river offers an instance of a stream adhering near to its original bed, notwithstanding a lava flow. The channel which passed to the Merced side of the ridge at Big Gap was evidently from the region now drained by the South and Middle Forks, and, as I have said, had no lava cap. But on the main river a flow of lava ran very nearly on the line of the present bed of the stream. West of Big Gap, it curved slightly to the south of the site of the modern channel, and there the lava cap may be seen for a distance of several miles. A rimrock separates this channel from the living river, and over this rimrock numerous springs are seen to rise from beneath the cement. At the point where this piece of a channel overlooks the Tuolumne, a tunnel was run into the pay gravel in 1869; but this gravel was so well cemented that it could not be washed, and the men threw up the claim in disgust, notwithstanding that they placed on exhibition at Oak Flat a piece of cement ten inches square, speckled over with gold on one side, like freckles on the human countenance. This gravel was of a dark blue, doubtless owing (as Mr. Talbott has well remarked) to the fact that the bedrock was of a serpentine slate.

For the present I will bid the auriferous gravels an adieu.

How to Avoid Strikes.

The extremely moderate and rational tone of the reply of Judge Dean, the president of the Cresson & Clearfield Coal and Coke Company, to the miners, dealing with the demands made by them upon the mine operators of District No. 2, embracing the Clearfield and Mountain regions, leads us to hope that a serious strike, affecting about 25,000 men, will be avoided. The whole style of this masterly address is a model for any employers of labor to adopt in dealing with a body of men who are possessed of common sense and capable of appreciating reason and fairness. In the preamble Judge Dean points out that the proposed scale of prices for mining agreed on by the miners of the district in convention makes demands which, if enforced at present selling prices of coal, would close the mines of the company he represents, and, in his belief, every mine in the district. He further gives the men credit for having in all probability acted without a knowledge of the facts as they exist on the side of the operators, and believes that if there had been a full consultation between fair, candid and intelligent men, operators and miners, prior to holding the convention, the action of the miners would have been different. This frank concession to the men on the part of the company of the right to make demands, and the appeal to them as fair, candid and intelligent men, was certainly the best way to insure fair consideration of the arguments of the mine operators. Then comes the plain *argumentum ad hominem* in the following words, which could certainly be understood by those interested:

"It seems to me our interests are so identified that it would be advantageous to us both to at least try to ascertain the facts on each side before taking such important steps affecting so seriously so many persons and such large investments of capital. We have invested over a million dollars in money; you have here the labor of more than 500 persons. We want to sell coal at a reasonable profit; you want to mine it at fair wages. If we do not pay fair wages you cannot afford to work for us and our mines must 'shut down.' If you demand unreasonably high wages we cannot afford to go on; the mines must 'shut down.' Neither of us makes anything by the shut-down; our capital lies idle; our improvements go to rack; you are idle for a longer or shorter time; lose time in hunting another place or other employment, besides expense of moving, with probably no larger returns for your work at the new place than you were receiving here, because wherever you may go you will not get more than fair wages; no operator can afford to pay more; if he attempts it, bankruptcy and a 'shut-down' soon follow. What is fair wages depends not on what you would like to get, or what we would like to pay, but on what, in view of the condition of the market and the nature of the competition we have to meet, we can afford to pay."

The demands of the miners were 26 in number, and through these Judge Dean goes carefully in his reply, conceding the point asked in some cases where fairness supported it, offering to make other changes requested if the miners could bring forward well-founded objections to the present method, and, in the case of those that affected the price of coal, tendering an inspection of the books of the company to prove to the satisfaction of the men that an advance in coal was incompatible with a continuance of operations.

The whole case is clearly summed up in these words: "The proposed scale seems to me to be based on a mistaken belief that this company is making large profits in which the miner does not share. You are receiving substantially fair wages in view of the condition of the coal business; this company at the same time has not earned and is not earning a fair profit on its large invested capital; nor do I believe any other operator in the district is in any better condition.

"Your right to organize and in convention adopt a scale advantageous to you, is not questioned; but a scale to be a fair one or a practicable one, must be based on existing conditions, on facts, and not alone on the interest of those who adopt it. In a business such as ours, which cannot be carried on by the operator without the miner, or by the miner without the operator, there never can be steady prosperity for both unless there be reciprocal good-will, fairness and candor."

While it may happen that in many cases the employer of labor, against whom a strike is threatened, has not so good a case on which to rest in reasoning with his men, we cannot too earnestly commend the style of argument adopted by Judge Dean, and we believe that were the demands of employes always met with a similar cool, judicial and painstaking exposition of the situation, many disastrous strikes would be avoided.—*Engineering and Mining Journal.*

IT IS ESTIMATED that in England one man in 500 gets a college education, and in America one in every 200.

[COPYRIGHT, 1890, by DEWEY & CO.]

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XIV.

[Written for the PRESS by JAMES H. CROSSMAN.]

Granite Quarries.

Having completed our examination of that portion of San Bernardino county that lies south of the range and in a previous article briefly described, we turn northward and cross the San Bernardino range at an elevation of 4676 feet, through Cajon Pass. From the summit of this Pass the broad expanse of desert comes into view, but the elevation is not sufficient to enable us to note its distinctive features, hills and low mountain ranges obstructing the vision.

From the summit of Mount San Bernardino, at an elevation of 11,550 feet above the level of the sea, with the aid of a field-glass we obtain a view of that portion of the amphitheater enclosed on the arc of a circle whose chord from west to east measures 216 miles, its area 17,496 square miles. A radial line extended from the center of the chord due north would intersect the center of the arc on the boundary line between Inyo and San Bernardino counties. From our point of observation, 108 miles west, we reach the ocean a few miles north of Santa Monica in Los Angeles county. We turn our eyes to the Orient, and the San Bernardino range with its outlying spurs gradually loses its integrity and disappears altogether in the desert before reaching the Colorado river. Scanning the horizon from east to west beyond the exterior boundaries of the arc, Clark, Kingston and Telescope peaks are seen. Tehachipi mountain, as well as other ranges of lesser note, stands in bold relief against the horizon contracting the circle, and at a lesser radius Garlic, Pilot and Eagle peaks and Old Dad of the Providence range form prominent figures in the landscape. In the foreground a verdureless plain, basin-shaped depressures, beds of dried lakes and short uninterrupted ranges without order or system, meet the eye in striking contrast with the green fields and cultivated farms lying off to the south and west. Viewing the country in that and the opposite direction, the change has been magical. The lines are sharply drawn by the crest of the mountain—on the south fertility, on the north sterility. We are apparently on a foreign soil. We reach Hesperia, a boom town, situated on the northerly flank of the range, with her unfinished buildings which were erected during the flush times, when corner lots in paper towns sold by the front foot. This townsite is covered by a forest of cactus. The Yucca plant attains here a hight of from five to eight feet. The short, stubby arms extending from its trunk are armed with bayonet-shaped leaves, terminating in a hard, flinty barb so sharp that it readily pierces man or beast if they come in contact with it. These monstrosities of the vegetable kingdom stand apart, each by itself, presenting in their isolation the appearance of a planted orchard. In the vicinity, however, and on the same tract of land, a redeeming feature meets the eye like an oasis on the desert. The cacti have here been conquered and give place to a cultivated field of 100 acres or more, on which the vine and various semi-tropical fruits have been cultivated with success. Here the vine comes to full maturity in three years or less, bearing evidence of the wonderful fertility of this soil wherever water can be obtained for irrigating purposes. Water from the Mojave river has been brought in here through a ditch 11 miles long.

Silver Mountain Mining District.

Having descended into the valley proper, we cross over into the low mountain range known as Victor, described in another article of this series. This mountain presents a seemingly impenetrable granitic wall to further progress in that direction. On a closer inspection, however, a narrow gorge is seen on its easterly slope. Here at an elevation of 50 feet above its base, an excavation of considerable extent appears in the rocky cliff, this being the result of man's handiwork. Presently a sharp report is heard and a black column of smoke ascending from the spot tells the tale that a blast has been fired, and a huge mass of the rock has been torn from its bed and sent to topple over, workmen appearing presently from sheltered nooks to ascertain the effect of the shot. This is the site of

The St. John's Granite Quarry,

Situated in the Victor district at an elevation of 2763 feet above the level of the sea. This property is owned and operated by the Hesperia Land & Water Company of Los Angeles, who have opened quarries on both the east and west banks of the river. The western quarry presents exceptional facilities for both quarrying the rock and handling the stone, its face rising to a hight of 50 feet above the railroad track passing near it. The product of the mine can be moved by gravity and landed in the cars, but the stone is inferior to that taken out from the eastern quarry, where the principal work is at present being done. The formation is stratified, the strata being of considerable thickness and easily quarried. The deposit which pitches easterly at an angle of 14° has been opened up for a length of 700 feet by

a depth of 60 feet, with 200 feet of vertical backs.

Upon visiting the quarry which is situated half a mile northerly from the town of Victor we found that the result of the shot witnessed was to detach from its bed a block of granite measuring 60 feet in length and four feet in width by 20 feet in thickness, and which after being dressed will contain 48,000 cubic feet. There is here very little waste, even the chips being utilized. This result was produced from a 15-foot hole, using a 2½-inch bit, loaded with Santa Cruz powder. The block was estimated by the superintendent, P. H. Leach, to have a value when dressed and ready for the market of $20,000. Another block lay on the floor of the quarry, which was being worked up into 4x4 size, its measurements being 9x13 feet. The color of the granite here is a bluish-gray, free from iron or other impurities likely to cause discoloration on exposure to the atmosphere. It splits straight with a clean fracture and dresses smoothly and is susceptible of a good polish.

In strength this stone is much above the average, competent judges having pronounced it fully equal in strength to the best Massachusetts blocks, which measuring 4x4 feet, are sold in Los Angeles for $1.25 per cut foot. Railroad and freight charges from quarry to Los Angeles by the carload of 20 tons are $20. This property has been worked steadily for the past three years by a regular force of about 25 men.

Thence northerly we follow the Mojave river for a distance of two and a half miles and reach the

Shearer Granite Quarry,

Situated on the easterly bank of the Mojave, which has been well opened and is producing stone of good quality. The face of the excavation is 50 feet in hight by 75 feet in length. The stone is reported to be similar to that extracted from its neighbor and in the same formation. This granitic belt is about 3 miles in length by one in width from north to south. On its northerly extremity a belt of limestone comes in, bisecting it at nearly a right angle. The stone is traceable for about 12 miles in the direction of Highland mountain, where it breaks up and becomes scattered, forming on its southerly flank a disconnected body of considerable dimensions in which a quarry has been opened, known as the

Los Angelea Granite Quarry.

It is owned by a party in Indiana, but no work is now being done upon it. The stone is much mixed and stained in streaks and spots. Some beautiful specimens of onyx have been quarried here and are now lying at the works. The plant here, consisting of shop buildings, etc., is ample for requirements. The product has been hauled by freight teams to Victor, 12 miles distant, for railroad transportation to a market.

(To be Continued)

Decay of Boilers.

Many explosions of boilers would not have occurred if closer attention had been given to the deterioration of the boiler caused by the general or local decay of the material. A boiler when new may have a factor of safety of six; but it must be remembered that with the beginning of the life of a boiler, decay also begins, and that the original margin of safety is gradually reduced by the ever-progressing decay caused by corrosion; and if this decay is allowed to progress too far an explosion is sure to take place.

Corrosion does not always attack the surface of steel and iron plates in a uniform manner, hence the decay is more likely to be local than general. This difference in corrosion is probably due to the structural difference in the plates; they are not always perfectly homogeneous, being prevented from becoming so by the nature of the processes of manufacture.

For instance, the fibers of iron are welded together by squeezing, hammering and rolling, which sometimes allow the fibers to be separated by thin layers of impurities. The innumerable air and gas cells in steel ingots, more or less perfectly welded together by hammering and rolling, also prevent a perfect homogeneous structure; and it is fair to assume that the imperfect structure of the material is one of the causes of local corrosion; but in steam boilers there are other causes for local decay; for instance, a thin scale tends to protect the plates, but this scale often becomes detached in local places, leaving the clean iron exposed to corrosive action which rapidly progresses. Again, the fibers of the metal may have been loosened by bending, hammering, etc., all of which tend to accelerate corrosion.

Plates are affected in various ways by corrosion; frequently small cavities are formed in the plate, the depth varying from a shallow depression to an actual perforation of the plate. In some places the cavities lie far apart; in others they are close together, giving the plate a honeycombed appearance. This phenomenon is called pitting and may be caused by surface defects due to the intense local action of fatty acids, or other particles of corrosive substances; in some cases the cause of pitting is attributed to the galvanic action of particles of heterogeneous metals.

From the foregoing it appears that to prevent pitting good material only should enter into the construction of the boiler, and if pitting then occurs the water should then be analyzed, and, if necessary, changed; and greasy substances should not be allowed to enter into the boiler.

Frequently the corrosion forms deep furrows parallel and close to the seams; this phenomenon is called grooving or furrowing. In nearly every case this furrowing occurs under the water line, and in horizontal boilers with lap joints, the grooves are deepest along the horizontal seams. Probably the chief cause for furrowing is a chemical action, because it does not occur with all kinds of water, and it rarely occurs above the water line. But this chemical action is accelerated by a mechanical action which tends to change the form of the shell of the boiler, bending or springing the plates along the seams; but the bending of the plates may break off the incrustation, or even the outside scale of the plate itself, thus continuously exposing a fresh surface of the metal to the chemical action of the water.

The mechanical action may be due to the constantly occurring variation of the pressure, as steam is made or blown off, or it may be produced by the changes of temperature; and if this change of form goes on continually, though ever so slightly, along the same line, the mechanical action of itself must finally produce rupture.

Furrowing is often due to the carelessness of calking, by which the skin of the under plate is cut; careless workmen should not be permitted to use a calking tool.—*American Machinist.*

OUR JOURNAL IN ARIZONA.—The MINING AND SCIENTIFIC PRESS is being accorded gratifying recognition by those in the mining interest in the progressive Territory of Arizona. Our agent, H. G. Parsons, sent us 60 new names as one feature of his work in the mining camps of Arizona, besides securing renewals. We believe our work will please our new friends at the South, and we invite them to co-operate with us in advancing the mining industries of that important region.

A Visit to the Otay Watch Factory.

EDITORS PRESS:—Leaving San Diego over the National City & Otay railroad, in a few minutes we reach National City (which I will describe in a future letter), and continuing, cross the rich valley of the Sweetwater. Here the N. C. & O. R. R. branches, one line going to the famous Sweetwater dam, the other to Tia Juana. Taking the Tia Juana line, we find ourselves a mile farther or ten miles from San Diego at Chula Vista. This in a few years will be one of the finest suburban towns in Southern California. Here are 5000 acres divided into 5-acre villa sites. The price of lots and cost of building as required by terms of sale preclude the possibility of an undesirable class settling here. The town is laid out on a beautiful stretch of land in full view of ocean and mountains, and is already well dotted with homes. Passing on three miles, we come to Otay, the home of the Otay Watch Co. By courtesy of Mr. P. H. Wheeler, the superintendent, I had the pleasure of seeing a California watch in all stages of its makeup from the crude material in the material-room to the finished watch ticking the tick of Otay. I give the following notes of the works, which, while brief, may be of interest to the PRESS readers:

The Otay Watch Works are situated in the flourishing young village of Otay, San Diego county, Cal. The works commenced building machinery a little over a year ago, and turned out their first watches May 17, 1890. The watch was a success from the very start, and it is truthfully said that it is the handsomest watch made in America, and for time it has no equal, thus speaking volumes for the great Pacific Coast. The watches may be found in all jewelry stores in California, Oregon, Washington and Nevada. Many have been shipped to Yokohama, Japan. The factory is on a very successful basis, at this time carrying a surplus to its credit each month. It is said beyond question that this has been the most successful start that has ever been made in America. The factory is three stories high, built of fine red brick, 100 feet long, 40 feet wide, with office, boiler and engine rooms separate. Fine green lawns are laid out in front of main building, covered by growing tropical vegetation of all kinds.

THE OTAY WATCH FACTORY, OTAY, SAN DIEGO COUNTY.

The experts came from Eastern factories at Elgin, Ill.; Springfield, Ill.; Columbus, Ohio; Waltham, Mass. The factory is under the supervision of P. H. Wheeler, the superintendent, who is the originator and designer of the Otay watch and the patentee inventor of all the inventions in use by this company. The factory is equipped with the finest kind of modern machinery, and the departments are run by skilled experts of the highest order and most successful in the watch business in the United States.

The company at present employs over 90 people, and is constantly adding to the number. To Frank A. Kimball, general manager, may be given much of the credit of establishing the company on a solid basis. In its early days before the first wheel turned, the company having underestimated the size of the undertaking, scarcely knew whether to continue or to retire. In this predicament Mr. Kimball, with the same enterprise that has ever distinguished him, came forward and personally set the company on the solid footing it now enjoys.

Otay, Cal. J. B. H.

IT is reported that new veins of gold have been discovered in the vicinity of Wausau, Wis., where mining operations were first commenced.

The Late Dr. John Percy.

At the last anniversary of the London Geological Society, the president, W. T. Blanford, in noticing the recent deaths of members, spoke of Dr. Percy as follows:

John Percy was born at Nottingham on the 23d of April, 1817. He was the son of a solicitor, and after his early education studied medicine in Paris, where he appears to have derived his peculiar fondness for chemistry from the teachings of Gay-Lussac, Chevreul and Thenard. Subsequently he entered the University of Edinburgh and took the degree of M. D. in 1839, when only 21 years old. One of his fellow-students at Edinburgh was Edward Forbes, afterward, like Percy, one of the professors at the School of Mines.

His election to the Royal Society in 1846 was due to original experiments and researches in pathology, but meantime he was much engaged in metallurgical and chemical studies, and especially in investigations upon the properties of nickel and manganese. Some of his discoveries at this period were the foundation of metallurgical processes now in extensive use.

On the establishment of the Royal School of Mines in the Jermyn-Street Museum, 1851, Dr. Percy was elected as lecturer on metallurgy, a post which he held for 28 years.

His position, as by far the first metallurgical authority in the country, was now acknowledged on all sides, and the work to which, in addition to his lectures, he devoted the greater part of his time during the years that he held the professorship in Jermyn St., was the production of a great work on metallurgy in general. At the time when he undertook this, there was no comprehensive work on the subject in the English language. The value of the information may be inferred from the fact that translations of all the volumes as they appeared, were published both in French and German. Rarely in any country, probably never in England, was a more brilliant and gifted staff brought together for teaching purposes than those who, under the late Sir H. de la Beche, established a mining school in London, 1851.

Among the whole of them, as I can testify from memory, in the unanimous opinion of the students, Dr. Percy's lectures on metallurgy and Sir W. W. Smyth's on mining were pre-eminent for clearness, command of the subject and the power of conveying information from the master to the learner.

At present there is scarcely a scientific metallurgist or assayer who has made himself known in this country by his work, who has not passed through Percy's laboratory and learned science from his teaching.

For Postal Telegraphy.

Within the week, Postmaster-General Wanamaker has made public a letter which he lately addressed to the House Committee on Post-offices, in favor of his plan for a limited postal telegraph. He says, among other things:

"I am more than ever convinced of the wisdom and practicability of restoring the telegraph to the postal service and of making it what it was originally intended to be—part of the postal system. I say this after closely studying the arguments against the bill made so vigorously by the great telegraph company which is now its only visible opponent. There is a deep and far-reaching conviction among the people that the telegraph service is by right part of the postal service. The measure is to give the country a vast enlargement of the postal system and to bring home to the people the cheap use of one of the most powerful agencies of modern commerce and civilization. * *

"It has been argued by learned lawyers for a score of years that a Government telegraph is unconstitutional....The courts of highest appeal have settled this question. Congress settled it in advance of judicial action by making the United States the owner and the Postoffice Department the manager of the first line of wire constructed for commercial and public use. The old Government telegraph schemes were constitutional. What shall be said, then, of the limited postal telegraph plan which I have been criticised for bringing forward? The Attorney-General for the Department has assured me that the conclusion that the scheme is constitutional cannot be resisted."

In concluding, the Postmaster-General says he has always invited the most rigid scrutiny and criticism of the measure. "It is not the proposition to take money from the treasury or employ additional civil servants; it is not a proposition to put any power whatever in the hands of the Government which is not at present greater and more dangerous where it is. It is the proposition simply to dovetail together two great machines so that one shall do business equitably and by that means make more money, which shall willingly be accorded to it by the people; the other to utilize its present skilled and faithful energy to help supply the people with still better means of communication, furnished still more cheaply.

"If others speak out for the telegraph stockholders, some one must stand out for the people in the interest of the cheaper telegraphy that they want. I believe it belongs to this Department to take this stand, and I propose intelligently and persistently to keep this subject before you, in the strong confidence that it will not be long before your committee will take steps to give the people the relief prayed for."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—*Register*, Oct. 11: At this mine they are running a drift from the Talisman property to connect with the works at the South Spring Hill. They have 200 feet farther to go, with ore at both ends. When connection is made, the ventilation will be greatly improved, thereby facilitating materially operations. Supt. Tregloan has got in all the winter supplies of wood, timbers, and other material, and is prepared for an early winter should such be in store.

MISCELLANEOUS.—Nothing new has transpired at the Amador gold mine during the week. The pumps are being taken out, and everything points to the shutting down of the property for a time—maybe for a long time. A number of miners were laid off temporarily at the Zeile this week, on account of needed repairs to the shaft, which will take several weeks to complete. Parties are expected from below to look at the Bright claim, with a view of purchasing it. The Sutter Creek and Rose mines paid off this week.

El Dorado.

GRIZZLY FLAT.—Cor. *Mountain Democrat*, Oct. 11: We had two days rain last week, just enough to lay the dust and to remind us that the rainy season is approaching. The rain was looked for and prayed for by the miners in early days, and they would work out in it all day without a coat, and some of them without gum boots, and then go home to a dinner of bacon and beans with black coffee and slap-jacks on the side—all happy. But it is different of late years. Let it commence to rain now, and there is a foot-race to see who will get to the house first. I made a mistake last week when I said the Oak mine was on the south brink of the Cosumnes river. It is on the northwest side, and from what I can learn is running all the time on good rock. Tom Daly and Millgate are in our camp again, and will soon begin work on their quartz mine. I understand the Parker Bros. have a 10-stamp mill on their claim, and are taking out good rock. John McClane is getting out timber, ready for work in his gravel claim. There are no idle men to be found in and around Grizzly Flat at present.

Inyo.

SYLVANIA.—Cor. *Register*, Oct. 11: Some 16 miners are employed in the Liberal and Climax mines, and work is being favorably prosecuted under the supervision of Foreman Cyrus Grant. An ore chute is being erected at the Liberal shaft, from which teams are to load for the furnace. It will hold 50 tons of ore. The furnace is nearly completed, and Machinists George Thorpe and Frank Higgs are getting the blower, boiler and engine ready, setting pumps and laying the required steam and water-pipes. Whether smelting will commence as soon as the furnace is ready is more than I know. A heavy rain has been falling here lately; no snow as yet in this immediate vicinity, but the White mountains to the west are clothed in a heavy mantle of white. Since my last letter was written, some rather unexpected changes have been made in the affairs of the Sylvania Mining Co. Mr. Sandhorn of San Francisco, a member of the present company, arrived here on the morning of Sept. 30th, having traveled all night. The day was occupied by Mr. Sandhorn, in company with Supt. File and Secretary Starrett, in making a careful examination of the mines and other property of the company, including the 800-ton pile of ore on the dump of the Liberal shaft, which proves to contain a much larger amount of waste than ore. After a thorough investigation, and a long talk over the condition of affairs, it seems to have been deemed inexpedient to continue any work not directly connected with the development of the mines. Therefore all work on the furnace, engine and boilers, the building over them and all outside work was the next day indefinitely postponed, and the services of some 20 men dispensed with. Work will be continued in the mines with the usual number of men prospecting, and about 25 men will be kept employed by the company during the coming winter. The date for pay-day having been so often set and just as often passed, the miners refused to go to work on the 1st instant, as they wanted to know something about the next date for pay-day. Since that morning, checks payable on 30 days' sight have been issued to all who are willing to take them or can make a satisfactory settlement. Several of the miners took the checks, quit work and left town. A few others are still here waiting to try to get sight checks. This is an injustice to men who are out of money, have been discharged and are compelled to go elsewhere to seek employment, and there has been a good deal of swearing over the matter. Mr. Starrett intends to have a regular pay-day established and then the men will be better satisfied.

BISHOP.—A carload of fine marble from the Inyo quarry passed up the road Saturday. These shipments are more numerous than the papers have opportunities to record.

FROM DARWIN.—Additions to the number of men at work in the Defiance mine, Darwin, are being made. The prospects for big yields from the mine are said to be exceedingly good.

Nevada.

TEMPORARILY IDLE.—*Tidings*, Oct. 13: The underground employes of the Omaha and Lone Jack are enjoying a brief period of enforced idleness while the shieves, etc., are being arranged to enable the handling of cars in the new landing, which is 40 feet higher than the old landing, thus insuring adequate dumping facilities. The mine is looking well and profitable operations, extending over many years, are anticipated.

GOLD HILL.—Pending the determination of the power question, no effort is being made to pump out the lower levels of the Gold Hill. Water-power is to be adopted, but it is not settled that it will be this fall. The 300-level drifts are being driven ahead, and in all 15 men are employed.

AN OLD-TIME MINE.—*Transcript*, Oct. 14: Work is steadily being pushed ahead on the Holbrooke and Harrington mine, situated on Randolph Flat, about three miles below Grass Valley. The shaft is now down about 110 feet and in hard cement. It is expected to strike the channel at the depth of 170 or 180 feet. Two shifts of two men each are doing the underground work, and are progressing favorably considering the nature of the ground.

STRIKE IN THE MERRIFIELD.—The Champion Mining Co., who are running a tunnel to strike the ledge in the Merrifield ground, on Friday night encountered a stringer six inches or more in width containing fine-looking ore. It is a feeder to the main ledge, which they expect to strike in a short time. The indications are favorable for getting it good when they do reach the ledge. Dr. E. F. Liebrick, J. S. Schuster, Peter Tautphaus, Henry Steinegger and E. S. Beedle, who are stockholders of the company, came up from San Francisco Sunday night to inspect the mine.

WASHINGTON DISTRICT.—*Herald*, Oct. 13: Mining operations on the Yuba river in Washington township, and on the ridge this side, have been going on quietly but satisfactorily this season. The gravel channels on the ridge are being prospected energetically, and we believe the result will show successfully. The operations of the Manzanita and Harmony are well known here. The mine back of the Central House, owned by a Sacramento company, and superintended by Mr. Mayberry, have been extending their tunnel until they feel confident they are under the channel. They will to-day commence an upraise. Worthley & Co. have done assessment work on their claims north of the Central House. The Centennial Co. are doing development work, and will soon have room for the employment of more men. The Centennial has a tunnel in over 700 feet and is pushing it ahead as rapidly as possible. The Huntington mill on the Red Point mine, this side of Washington, is in place and the building is nearly completed. The Washington mine at Ormonde is running full-banded and the mill kept running steadily. The quality of the rock recently crushed by George G. Allan at the Nevada county mill proves what may be expected for the next six months' work. Jack Rodda is working on his claim just above the Washington, and has C. E. Clinch of Grass Valley and another partner in with him. He has struck a very large ledge which shows free gold liberally. The Yuba and Eagle Bird mines are turning out monthly dividends as usual, and will for several years more on ore now in sight. The Governor Morton mine is showing up well. The lower tunnel is now running on a two-foot ledge which shows well in free gold and carries sulphurets that are very rich. The Blue Jay mine is being worked and good rock is being taken out. The owners are desirous of selling the property, as all of them are not in a condition to prosecute extensive work. It is one of the best prospects on the river. There are several other operations going on up in that section. In fact, Washington township is keeping up its record as a gold-producer, and promises to outstrip itself in the near future.

WATER OUT.—*Transcript*, Oct. 11: Capt. Jas. Hammill, who has charge of the Coe mine, informs us that the water is entirely out of the mine, and that in a very few days some of the members of the Board of Directors are expected here and will give the mine a thorough examination. It is believed by many that the Coe is an extension of the old Eureka mine.

Plumas.

THE OLD RIVER CHANNELS.—*National*, Oct. 11: Despite our considerable other resources it may be well to remember that mining in this section is our sole dependence, as it has been for all who were here before us. A few of the old class of '49 miners are still here, and cling with melancholy fondness to the same old bars, the same gulches, rivers and creeks, that in the days of old yielded up to the touch of man wealth that is now beyond the dreams of the most imaginative enthusiast. Fortunes were made in spaces of time that now must be recorded in years and life spans. Gold in those days was easily found and easily gotten. The erosion of centuries had broken through the mighty vaults of water and tapped the golden streams which flowed, and flow unceasingly to this day, and will continue to flow forth their yellow grains, until the mountains are worn away and plains take their places. It is now into these strongholds of wealth, or nature's treasure-boxes, that man must look for gold. He cannot await another epoch in nature's calendar to again glean from the surface a secondary deposit, but he must go to the fountain heads from whence these accumulations came, and there dig from the mother vein, metal in its virgin purity. Quartz, however, is not the only prolific source. The extinct river channels with their deposits of gravel, offer next to the quartz veins, a source to which the prospector may turn with almost equal assurance that by a diligent, intelligent march his labors will be rewarded. The active rivers of the present day have yielded from their beds great wealth. Hence it is altogether without reason to believe that the old channels which have ceased to flow will likewise yield a gathered treasure equal to our live rivers of the present time. This has been proven in very many instances. Great mines have been discovered in old channels, and still hundreds exist in these mountains, plainly in sight, that have not been touched by the hand of man, though it is safe to predict that before many years shall pass these will be opened and their beds explored. There is a dearth of prospectors at the present time. The old-time pick, pan and shovel prospector has passed almost completely into oblivion; his occupation is gone. The shallow surface mines have yielded their allotment, and the old prospector to whom this State owes her greatness has, like the "digging," about "yielded his allotment" too. The native sons turn from the pursuits of their fathers to less laborious vocations. This leaves the field of unopened mines to remain in primitive darkness, unless capitalists can be induced to take hold. The chances for investment in the opening up of these old channels offer inducements unequaled in the whole range of legitimate business.

Shasta.

LOWER SPRINGS.—Redding *Free Press*, Oct. 11: Monroe Thomson has shut his mine down in Lower Springs district. He is entirely satisfied with its appearance, having a fine ledge of rich ore. Further developments may be expected in the near future. Joe Penrose has discovered a rich ledge on Gambler's gulch.

CENTERVILLE AND SKY BLUE.—William Kellner showed us on Thursday some fine specimens from his new discovery near Centerville. One specimen of quartz had been broken in three parts, but was held together by the seams of gold running through. Kellner has taken out about $1000, and still has a two-foot ledge of good ore. L. A. Bouk has associated himself with Mr. Connor in the development of the Sky Blue mine, a mile and a half above Middle creek on the Sacramento river. Farther depth on the shaft and prospects in the tunnel show plenty of rich ore. These gentlemen are preparing to place a Kendall mill on the property. Mr. Connor is one of the best and most persistent prospectors in the county.

OF NO USE.—C. H. Sikes just finished hauling 85 tons of machinery and scrap iron from the Afterthought mine to Redding, to be shipped to Joshua Hendy & Sons, S. F. A brave attempt was made several years ago by a Mr. Stewart to make the rebellious ore of the Afterthought pay a dividend, but it was of no use.

DAM AND ARASTRAS.—The new mill of the Calumet Co., which will contain 21 Paul Americanized arastras, is moving on to completion. Part of the number are set and running. Several others arrived at the depot this week. As fast as they are received they are set up and started. This building of arastra mills on the Mexican principle is a new feature in California gold mining, and we think a good one, as arastras always give good results. This company has about completed a stone-cement dam at the head of their Spring creek ditch, which conveys water to their mills eight miles distant. The dam is one-third the thickness of its length and half the thickness of its hight. It is put in to stay.

OLD DIGGINGS.—Mr. Hart, of the Texas and Georgia mine, Old Diggings, will erect a 10-stamp mill on the Sacramento river to be fed with ore from the mine by means of a bucket tramway. Messrs. McCready and Luse have the contract for $1000 worth of wood.

Tulare

RICH FIND.—*Territorial Enterprise*, Oct. 9: A copper vein 150 feet in width has been discovered in the mountains back of Mineral King, in Tulare county. Assays have shown that the product shows 18 to 30 per cent pure copper and $107 in silver per ton. It is claimed that the find is as rich as any of the Lake Superior mines.

Tuolumne.

LUNDY ITEMS.—Homer *Index*, Oct. 11: Wm. P. Okbst and others have made a promising discovery on the red hill west of Saddle-bags lake. It is a ledge of carbonate ore assaying 50 to 70 ounces in silver and 60 per cent lead. May Lundy waste dump material is being screened and will be worked in an arastra. It would surprise many persons to know the amount of bullion that has been shipped from this district during the season, and considerable more is to follow.

NEVADA.

Washoe District.

ON THE COMSTOCK LODE.—*Territorial Enterprise*, Oct. 12: The following embrace the principal operations and events on and in the vicinity of the Comstock lode during the past week: The situation in Potosi is interesting and encouraging. An important development has been made in the south drift from the 1130 station in the winze, now sunk to the 1200 level from the 930. After excavating a working station at this point, they started an east crosscut and got into ore, and then they drifted north and southwest of the pay. The first day the south drift ran into quartz and porphyry of indifferent value; but it improved as the drift proceeded southward, and last Thursday it got into ore that assayed all the way from $12 to $80 a ton, the metal being poorly diffused through the mass. The width of this pay quartz is not yet known. The encouraging feature of this strike is that the diffusion of the precious metals is coming in more solid and richer as progress is made southward, where elbow-room for the existence of an extensive ore body is ample on every side. The scattering pockets of rich ore that have been found in the formation being prospected by the workings connected with the winze below the 930 level are indicative of the existence in that neighborhood of an extensive precipitation of the precious metals somewhere between the clay walls of that vein, and the management are determined to find out where. It is this fact which has kept up the stock of the Potosi to a good figure without any showing of more than mere pockets of pay ore. The winze is down to the 1200 level, and a south drift on the 1200 level is being sent out to connect with the bottom of the winze, both for air and to facilitate the working of the mine. The following information has been gathered from the weekly letters of the superintendents:

ALTA.—Crushing about 315 tons of $21 rock per week. No change in mining work.

YELLOW JACKET.—Shipping 78 tons of $19 ore daily to the Brunswick mill, and doing extensive prospecting work throughout the mine.

OVERMAN.—Extracted 416 tons ore. Shipped to Brunswick mill 431 tons. Battery assays average $16.08 per ton. Stopes on the 200 level and from winze below 1200 yielding about as usual.

CROWN POINT.—Are still extracting some ore from the 300 east stope, but the pay is becoming narrower as we go north and south on it. The 300 west stope looks about the same as last week. Shipped to the Mexican mill during the week 389 tons of ore, average battery assay, $15.45.

JUSTICE.—The work of cutting out the 822 station of the main shaft is progressing rapidly. No change of importance in the stopes. Shipped to the mill 191 tons of ore. Average battery assay, $30.66 per ton.

SAVAGE.—Extracting ore from the 500, 600, 750 and 1300 levels. During the week have hoisted from these levels 842 cars of ore; shipped to the Rock Point mill 391 tons and to the Mexican mill 380¼ tons. Milled 860 tons; average battery assay, $21 per ton. Have bullion on hand for this month's account, $9038. Have resumed work in the face of the southeast drift on the 1380-foot level and advanced same 45 feet.

HALE & NORCROSS.—On the 800 level the north drift was advanced 25 feet. Face in low-grade ore. Have taken out old pump rod and columns to the 600 level, and started repairing the incline at 1300 station, in order to resume explorations below this level.

UTAH.—In the main south drift from the west drift, at a point 600 feet in, east crosscut No. 2 has been advanced 76 feet; formation, porphyry showing clay slips and some quartz.

CHOLLAR.—Are making repairs on the 850, 450 and 750 levels. West drift, 60 feet south of north line, 850 level, has been advanced six feet; total length, 70 feet; face in hard porphyry. Have started an upraise from the drift that is up 12 feet in hard porphyry. Extracted and sent to the mill 524 tons of ore; average battery assays, $22 09 per ton.

POTOSI.—The winze below the 930 level is down on the slope 437 feet. The bottom is in porphyry with streaks of quartz. The north drift from the 1030 level winze station is out 56 feet, the last 10 feet being in quartz giving fair assays. The north drift from the 1130 winze station is out 57 feet. The face is in quartz and porphyry yielding low assays. The south drift from the main incline, 1230 level, is out 490 feet. Face in hard porphyry.

EXCHEQUER.—East crosscut near the south line, 600 level, is out 42 feet. Formation, quartz and porphyry. North lateral drift, 600 level, is out 48 feet; face in hard porphyry and stringers of quartz. East crosscut, 500 level, 150 feet south of north line, is out 179 feet; face in clay and stringers of quartz.

ALPHA.—East crosscut, 70 feet south of shaft, 600 level, is out 158 feet; face in quartz giving low assays. East crosscut, 70 feet north of shaft, 600 level, is out 93 feet. Face in quartz giving low assays.

CON. NEW YORK.—No work except repairing and easing timbers on 650 and 800 levels has been done the past week. The north drift on the 1100 level is now out 222 feet; face in quartz and porphyry.

SILVER HILL.—Northeast drift from the winze, 600 level, is advanced 15 feet through hard porphyry; total distance from the winze, 420 feet. Northwest drift, 334 level, is out from shaft 490 feet; face in porphyry and small streaks of quartz.

WARD COMBINATION SHAFT. — East drift from the 1800 station is out 595 feet; face in hard porphyry.

ANDES.—During the past week on the 420 level the north drift from No. 1 crosscut has been extended to 246 feet; formation, porphyry, clay and quartz giving low assays. The south drift from No. 1 west crosscut is extended to 43 feet; formation, porphyry and quartz.

GOULD & CURRY.—On the 200 level the northwest drift has been extended 12 feet; total length, 38 feet. Formation, quartz showing some value. On the 300 level the south drift has been cleaned out and repaired 50 feet; total distance, 370 feet. On the 625 level the south drift has been cleaned out and repaired 28 feet; total distance, 396 feet.

BEST & BELCHER.—On the 800 level the north drift has been cleaned out and repaired 100 feet. On the 1200 level west crosscut No. 1, 45 feet above this level, has been extended 18 feet; total length, 85 feet. Formation, porphyry and clay, with streaks of quartz.

TO BE REBUILT.—Eureka *Sentinel*, Oct. 11: The hoisting works of the Bay State mine at Newark, which were burned down about 2½ years ago, are to be rebuilt, and will be ready to run about Oct. 10th.

Tybo District.

A FAMOUS DISTRICT.—Belmont *Courier*, Oct. 12: The mill at Tybo has been repaired and work has been resumed in the mines, with W. D. Dimick as foreman. Some assays recently made of ore from Thomas Warhurton's mines, at Jett, gave fine results. The ore is very rich in silver and lead.

CHERRY CREEK.—The Muscle Co., which has been operating the Exchequer mine at Cherry creek for the past six months, has thrown up the lease and suspended operations. The boys did fairly well during the time they run the mine, paid all their bills and quit ahead of their summer's work. The mine will soon resume work under another management. The Merrimac Co. has purchased the Monte Cristo mill on the other side of White Pine mountain, and will move it to Cherry Creek, to be used in connection with operations in the old Star mine.

ARIZONA.

NOTES.—Prescott *Courier*, Oct. 4: A narrow-gauge railroad into our developed mining camps is now being very much agitated by Ex-Governor Tritle. The Rapid Transit mine, in Bradshaw district, is showing up better and better. The tunnel is 220 feet long; vein three feet thick, all good ore. The owners of the Hillside mine, are shipping high-grade ore from Garland's station, on the P. & A. C. railway. Muddy roads prevent teams from moving much ore to the railroad. Teams are constantly going to Congress with supplies and bringing in sulphurets. Mines of Upper Big Bug creek and adjacent camps want pack trains to carry ores to the Hope and Lowell mills. Alexandra, Peck district, which a few months ago was "dead as a nail," is just now a lively camp. The change is due to S. C. Mott's success in the Prince and Warrior mines. The Rowe mine is also helping out.

CLIFTON NOTES.—Tucson *Citizen*, Oct. 4: The Arizona Copper Co. is in a prosperous condition. The company is turning out large quantities of copper bullion and doing considerable development. At Morenci the Detroit Copper Co. is running three furnaces at full capacity. The Copper King Mining Co. at Clifton is building tramways from the mines to the smelters.

ORE CONCENTRATOR.—*Arizona Silver Belt*, Oct. 4: The concentration of ores in Arizona where water is scarce will be a future study of practical mining men. The first plant of this description is now being put up on the north side of the Dos Cabezas mountains.

BRITISH COLUMBIA.

IN THE HOT SPRINGS DISTRICT.—Fifteen men are at work on the Skyline, and about as many more on the United and No. 1. The rich streak in the United is next the foot-wall and is about 18 inches in width. In specimens brought to Nelson, native silver is almost as plainly visible as cube galena is in specimens taken from near the surface. Assays of $4000 and upward have been obtained, and fully two tons of the high-grade ore are now on the dump. Picked specimens of pure silver, nearly as large as a standard dollar, are on exhibition at the mine. The same character of ore has been struck in the Neosho, a claim about half a mile southwest from the United. The Neosho is owned by about a dozen of Ainsworth's leading citizens; every one of whom expects to make a large "nest-egg" out of the property. J. M. Buckley, at one time superintendent of the Northern Pacific system west of Helena, Montana, and more recently superintendent of the Spokane Falls & Northern, came in by the Galena pa

Monday to look at claims he has an interest in, and before leaving, made arrangements for prosecuting development work on them. S. H. Northey started for Butte, Montana, on Friday, for a steam hoist and pump for the Little Donald. The boiler will be 20 horse-power. The Little Donald is owned by the Davenports, and Mr. Northey has a contract for sinking on it. The Goat river district is said to be promising well, although prospecting is difficult because of the depth of alluvium. Two assays made last week gave 45 ounces in silver and 80 per cent lead, and 22 ounces in silver and 60 per cent lead. No news whatever from Trail creek this week.

COLORADO.

PITKIN ITEMS.—Aspen *Times*, Oct. 1: Work is in progress on the Silver Islet and Sacramento. From the latter mine some high-grade ore is being shipped. The Tin Cup country is also shipping some very good ore. This is hauled to Quartz, a station about 12 miles west of the Alpine tunnel, on the South Park road. Ore-shippers are now seriously inconvenienced by a scarcity of cars. The Aspen is, perhaps, most seriously affected. This mine now has some 1500 tons of ore tied up in Denver. It is producing at the rate of 200 tons per day, and has not storage capacity for more than one or two days' output. The Trainor mine is quietly shipping an average of about 12 tons of ore a day and developing into a big mine.

MISCELLANEOUS.—Georgetown *Courier*, Oct. 4: The Paymaster and Commonwealth are outputting their usual quantity of ore. There are no more steady producers in the county. The Lost Treasure and American Eagle lodes in Cascade district have been sold to the Ute Chief Mining Co. The consideration is $500,000. A strike has just been made in the J. C. Johnson mine, the property of the Standard Mining Co., which gives promise of being of the greatest importance. Twelve feet of solid lead ore has been penetrated, 18 inches of which runs 1460 ounces in silver to the ton.

PLACER MINING.—Elk Mountain *Pilot*, Oct. 9: Placer mining in Washington gulch has been shut down for the season. While there has been considerable work done, very little benefit in a financial return has been the result, and it will take another season to bring about that most desired by the parties engaged in the enterprise. The Metzler Bros. and Dr. Evans spent the most of the season putting new sluice-boxes in and preparing for active work next season. The McCay, Gray & Burton outfit have done considerable work in building a dam and putting in sluice-boxes. They have had a good deal of trouble in getting a hose to stand the water pressure. Aside from the delay caused by the hose bursting, they have been washing all summer, and have nearly reached the old channel, where so much rich dirt was taken in the early days of the placer mining in this gulch, nearly 30 years ago. In their summer's work they have unearthed cabins, picks and other evidences of the pioneer diggings. Much interest will be felt in the progress of this work next season.

STRIKE AT MINERAL POINT.—Crystal has been very much excited over the recent rich strike in the Illinois group on Mineral Point. Ira Cline was here last week and says it is really a strike of much merit. Ore assaying as high as 500 ounces of silver to the ton is found in quantity. Aspen parties by the name of C. P. Gentry and W. A. Reilly, have a bond on it and will work it vigorously all winter. These claims were located this summer by Frank Edgerton, Geo. Melton and Dave Lyons, and the discovery was made with very little work.

BIG THING IN O BE-JOYFUL.—The Callahan Bros. of Aspen have been over here for some time working their mining property, situated up at the head of O Be-Joyful basin. The boys do not make much blow about it, but they have got some property up there that will astonish everybody some day. It will take some capital to get it in shape to be a valuable producer, and the day is coming when that will be forthcoming.

DAKOTA.

A GOOD SHOWING.—The London *Mining Journal* of Sept 13th says: We are now able to give the result of a crushing and smelting of tinstone from Dakota. The tinstone received weighed 17 tons and 1562 pounds, and this yielded 1810 pounds of black tin, say 114 pounds, or over five per cent. This black tin assayed 70 per cent for metallictin. The quantity of metal in the ore obtained (1810 pounds) calculated on the assay of 70 per cent would be 1268 pounds. As a result of our smelting, we actually obtained 1229 pounds of refined tin.

EXPERT TESTIMONY.—*Pioneer*, Oct. 12: The Duluth *Herald* has interviewed Capt. Joseph Sellwood, an expert in both iron and tin mining, in regard to the Black Hills tin mines. He says there is no reason why within 10 years these hills should not yield at least half the tin used in this country. The ore-bearing veins are chiefly tin quartz, much like the Cornwall veins. They average about eight feet in width, and occur in a formation of soft slate, dipping at an angle of from 65 to 70 degrees. They claim in the leading properties an average of four per cent, and they have one unquestionably running as high as this or higher. But for precaution sake halve the claim, say two per cent, which from my own examination I am sure the ore will yield in practice, and then you have an ore running far better on an average than in Cornwall. The showing in this district is unquestionably fine, and would be so accounted anywhere. There is no reason in my judgment why more tin ore is not mined, except the high relative cost of labor. At Hill City you have got to pay $3 a day to good miners. At Cornwall, where I came from, the best men don't earn over £5 a month, and £3, or say $15 a month, is a much commoner rate of pay than $20 or $25. I was put to work in a Cornwall tin mine when I was but nine years old, and my leg was broken in dangerous work when I was ten. I never had a day of schooling in my life, and the boy who grew up with me, worked side by side with me in the mines from childhood as I did. If that is the kind of pay and training we want in this country, we can get cheap tin sure from the Black Hills, as well as in Cornwall.

THE BULLION MINE.—Last week a ton of ore was taken from the Bullion mine and run through the Gleedale mill, from which they obtained about 400 pounds of concentrates. The concentrates have been sent East for smelting, which is done, we understand, to thoroughly and definitely satisfy parties who have about completed arrangements to take a large interest in the mine. If all is satisfactory, about which there can scarcely be any doubt, very important work will be commenced at once. Mr. Albert Sellner, of Quincy, Ill., has been at the mine for over a week, and looked after getting out and concentrating the ore, so that the parties he represents will be fully satisfied with the results.

FLOAT.—A great deal of ore passes through town every day, a portion of it going to the D. & D. smelter and some coming from the Double Standard mine, which is now shipping ore to Omaha for treatment.

IDAHO.

SURVEYING.—Wardner *News*, Oct. 4: In a conversation with the surveyor-general yesterday, it was learned that the surveying of mining claims is very active at the present time, much more so even than during the same period last year. Applications for patents are pouring in from all over the State. Silver City and the Basin are very active in this respect, as are also Kootenai county and the Seven Devils region. In some localities there are at this time more applications for surveys than surveyors to make them. Throughout the State, in fact, there is a great demand for surveyors. Cinnabar ore has been discovered on Quicksilver mountain, the southern continuation of War Eagle mountain.

RICH STRIKES.—Boise *Sun*: Some wonderful discoveries in mining property have been made on the Idaho road near the Halfway house in the past few days.

MINES ABOUT IDAHO SPRINGS.—*Gazette*, Sept. 30: The Silver Age, which is the heaviest producer in this locality, is making preparations to work on a larger scale than ever. They have just completed laying 4000 feet of air pipe from Clear creek to the mine to carry compressed air from the compressor, which will be located on Clear creek. This will save the great cost of fuel. They have just completed an engine-room 500 feet from the mouth of the tunnel, where they will sink the main shaft. The engine will run by compressed air. They have 60 men employed and produce from 140 to 200 tons per month. The Dove's Nest, under Supt. John Owen, is probably the most systematically worked mine in the county; ore everywhere; shaft 400 feet deep; 1500 feet of levels; no stoping done. The Cincinnati is producing from 12 to 15 tons per month. The ore averages $160 per ton. The Esmeralda, belonging to the Idaho Tunnel Co., is worked under lease by eight men, who have a small vein of high-grade ore in the east end. The parties leasing on the west end are getting mineral in pockets. The Casino, which is being worked on the tribute system under the management of J. C. Simmons, has 30 men employed and is taking out from 70 to 85 tons of mineral per month, which averages $40 per ton. The Tenwall, worked under lease by Robert Callow, has eight men employed and produces 10 tons per month, which average $100 per ton. The Metropolitan, one of the old stand-bys, employs eight men, who are producing 20 tons per month, worth from $125 to $150 per ton.

SEVEN DEVILS.—*Citizen*, Oct. 10: Several sales have been made of late to prominent mining companies, who will commence development work at once. It is reported that the Old Peacock mine has been sold to parties from Kansas City, Mo., and Butte, Montana, at figures that show that property here is rapidly advancing in price. If the report proves to be true, it will be the biggest mining deal ever made in this locality. At present there are capitalists here from Denver, Colorado, Kansas City, Mo., and Wood River. The camp is booming and now is the time to make investments, as mines are cheaper than they will ever be again. The road is now nearly completed to the Peacock mines. Parties can drive to the Lockwood saddle, which is only 2½ miles from the mines. The road will be completed by the 15th inst. The Boston Co. will sink their shaft 100 feet deeper this winter, and also drift 50 or 100 feet to see the extent of their ore deposit. The Kleinschmidt Co. will sink several shafts on their property, and are now shipping ore. C. F. Drake, Supt. South Peacock Mining Co., has gone to Weiser to attend to the shipping of ore, and has sent several samples to be assayed. The bodies of ore that are in plain view at the Seven Devils are a surprise to all who have seen them. Quite a number pass by here on their way to the Devils most every day, that we do not get to see. Large nuggets of gold are now to be found in the ore. This great copper camp is being talked of more and more every day and the excitement is growing more intense with the arrival of every party of capitalists, and with every day there comes a new outfit, who have in many instances come thousands of miles to see the great and wonderful Seven Devils. Although the reports that are being circulated appear almost fabulous to those who have never visited the mines, yet one visit, however, is all that is required to convince the most doubtful of the truthfulness of all reports.

SALE AT BELLEVUE.—*Statesman*, Oct. 13: One of the biggest mining sales known for years in this section is about to take place. For days, rumors have been afloat regarding the transaction, but nothing definite was learned until this afternoon. It seems an English company is looking for investments in this region, and their attention has been turned to the mines around Bellevue. A party of experts are now on their way here to examine the properties, and there is hardly any doubt but that the sale will be made. The transfer will include the famous Minnie Moore and Twin Sisters, the Relief and also the Michigan. The two latter are owned by H. E. Miller, and the Minnie Moore is owned by an English company, of which the late John M. Kinnear was superintendent. The three properties are contiguous to each other, and if the sale is made, will be worked as one. Bellevue is feeling very jubilant over the outlook. Close on the heels of the victory in the county seat fight comes this good news, and in consequence the citizens are all wearing hopeful smiles in anticipation of a bright future for the Gate City. This sale means the employment of from 200 to 400 men in and around the camp.

LOWER CALIFORNIA.

NOTES.—*Lower Californian*, Oct. 2: The Princessa Co. of Alamo started extracting ore last week from its new rich strike in the Ulises. Mexican Gulch is coming up in the production of quartz. The Manzanita mill at Alamo has crushed several lots of ore which runs high. The Calmalli gold mines, located 300 miles south of Ensenada and 54 miles inland from Santo Domingo, and owned principally by Emiliano Ibarra, are reported as turning out considerable bullion which is shipped to San Francisco via Mulege, on the Gulf coast.

MONTANA

ALDER GULCH.—Anaconda *Review*, Oct. 11: Alder Gulch is coming to the front again and Virginia City seems to be renewing her youth. Several new strikes are reported in the vicinity and they are holding out in a way that is most encouraging. The Alameda, a new mine, promises to be a bonanza. The Champion Co. has been reorganized and the stock made assessable.

DEER LODGE ITEMS.—*New Northwest*, Oct. 3: Developments at the Lion Co.'s mine, Oro Fino district, are very satisfactory. The Standard is a St. Paul mining Co. organized for the purpose of developing the Patsywatomie group of mines on Indian creek, about four miles east of the town of Champion. The Mineral Hill G. & S. Mining Co. is a new company lately organized, with the principal office at Butte. The stockholders are M. E. Pinney, R. E. Pinney, J. W. Mishler, S. B. Calderhead and F. E. Parker. The two latter-named gentlemen are prominent railroad men of Butte. The company is stocked at 500,000 shares of the par value of $2 per share, and is made assessable after Jan. 1, 1892. There is said to be considerable excitement in Marysville over the reported discovery of a new mining district on Miller creek, which is equi-distant from Marysville and Helena, about 20 miles. It is said to be in a slate formation, and some very rich ore, carrying flake silver, has been picked out. There is said to be a five-inch streak of ore on one claim that runs $1800 to the ton. A large number of prospectors have gone out to investigate.

A STRIKE.—Butte *Inter-Mountain*, Oct. 11: A strike of unusual proportions in the Silver Bell at Castle is just now commanding attention. Ore carrying 160 ounces of silver and 47 per cent lead has been encountered at a depth of only 15 feet.

DEVELOPMENTS.—*Mining Review*, Oct. 11: Developments in Montana mines thus far during the current year have reached enormous proportions, and, judging from the present influx of Eastern and foreign capital in this direction, the number of dividend-paying mines in our young State will be doubled in the next six months.

CARDWELL DISTRICT.—Boulder *Age*, Oct. 11: Some good strikes are reported in the Cardwell district, and considerable development is going on in consequence.

NEW MEXICO.

FOLLOWED UP THE FLOAT.—*Western Liberal*, Oct. 10: There has recently been illustrated in this vicinity the old saying that "it takes a tenderfoot to find mineral." It is generally conceded that if there is a section of New Mexico which has been well prospected it is the country around Shakspeare. The other day W. B. Catchings, Col. May and W. D. Griffith were out riding. Mr. Catchings noticed a piece of rock, broke it open and asked Col. May's opinion of it. The Colonel said it was fine, and all hands went to looking for the ledge from which this had floated. The ledge was found and assays of samples taken from it showed it to be carbonates of copper and iron carrying about 28 ounces of silver to the ton. The main beauty of the ore, however, is its smelting qualities, as it is, according to Col. May, as fine a smelting ore as he ever saw.

A SUCCESS.—Prof. Waring of Silver City writes to the Humholdt Co. that he has completed his experiments with the ore from the Superior mine, and they were a grand success. The process consists of leaching and smelting. The professor will soon leave for New York to make arrangements for the erection of a plant.

A DRY CONCENTRATOR.—A. P. Granger, who has invented a dry concentrator, which he claims to be a great success, was in the city this week en route to Bowie, where he is erecting one of his machines.

OREGON.

GRANT COUNTY ITEMS.—*Weekly Red Rock*, Oct. 12: Clark & Trowbridge are having considerable work done on their placer ground over by Silvies valley, running cuts, etc. The boys of the Humboldt Co. are building a reservoir and making other preparations for a fall-run in their mine if sufficient rain falls. Mr. J. A. Whitman, who has for years been Grant county's most industrious prospector for hidden gold, brought some white quartz to town last week with chunks of the precious metal sticking to it. He has run a tunnel into the mountain a long way, and feels confident of tapping the ledge during the coming winter.

FINE SPECIMENS.—Several fine ore specimens brought in by David McCoy from the Elkhorn-Bonanza mine clearly show the great wealth of the district in which this mine is located. In speaking of the Elkhorn-Bonanza property, of which Mr. Fred Plau is manager, Mr. McCoy says the work of development has been done in a very scientific manner and reflects credit upon the mining ability of Mr. Pfau. Further, Mr. McCoy says that the Elkhorn-Bonanza is showing itself to be a fine property, and one that some day, in his judgment, will rank with the well-known Baisley-Elkhorn and Robbins-Elkborn properties, which are now turning out their thousands of dollars monthly.

AWAITING THE RAIN.—The extensive and well-equipped Wadleigh hydraulic mine is now in readiness for gravel-washing, awaiting only the advent of winter rains to begin. This is one of the most valuable properties of the kind on the Pacific Coast. No lack of water, rich gravel or fine timber here, nor is there any danger of the debris question ever coming up to trouble the hydraulic operator. A great gold harvest will be gathered from this ground henceforth and for a hundred years to come.

SILVER MINE ON ANDERSON CREEK.—Ashland *Tidings*, Oct. 12: The prospecting work done by the Empire Mining Co. of San Francisco at the Trombley mines on Anderson creek is reported to have developed a rich strike in silver rock. The report is that an 11-foot vein has been struck which goes $30 to the ton in silver. J. J. Owen, the principal man of the company, with two other San Francisco men, accompanied by Mrs. Owen and two other ladies, came up Saturday to visit the mine, and remained until Tuesday morning. They seemed much pleased with the prospects. The company has run one prospect tunnel 150 feet, and is at work upon another, and the belief is that they have struck a good silver-bearing ledge.

UTAH.

ORE AND BULLION SHIPMENTS.—Park *Record*, Oct. 4: The Ontario bullion product for the week was 33 bars, containing 19,067.93 fine ounces of silver. During the week the Crescent Co. shipped 270,700 pounds of concentrates and 43,100 pounds of J. M. Richardson's first-class lease ore. For the week just ended the Mackintosh sampler received and forwarded 606,030 pounds of Ontario ore; 135,440 of Anchor concentrates from the Union concentrator; 36,770 of Woodside ore; 28,980 of Apex; 11,560 of Hayt's Southern Tier ore, and 20,390 pounds of Flindt & Varcoe's Mayflower jiggings; total, 839,170 pounds.

NOTES.—Salt Lake *Tribune*, Oct. 5: The Woodside mine is looking fine and will soon be found in the list of heavy ore shippers. The Anchor tunnel continues to improve and is said to be a veritable bonanza. Work will soon be commenced on the Lucky Boy property and will be continued during the winter. The Centennial-Eureka is shipping in some of the richest ore that has been received here since the remarkably rich ores from Salmon river 12 years ago. From January 1st to October 1st the Ontario mine produced 736,058 ozs. of bullion and dividends to the amount of $675,000. The Daly mine has also paid regular monthly dividends aggregating $337,500 during the same nine months. The Horn Silver maintains its usual output, and is paying expenses and something more. Its stock, 1605 shares, sold in New York last week at $3.40 to $3.60.

STRIKE.—*Stock Exchange Journal*, Oct. 4: A very important strike was made a few days ago in Settlement canyon, Tooele county, where a free-milling gold-bearing quartz, running all the way from nothing to 200 ounces gold per ton, was uncovered. The claim where the strike was made is also one and had been abandoned.

THE MAMMOTH DIVIDENDS.—The Mammoth of Tintic is principally owned by the McIntyres of this city. The only information which the *Tribune* is able to give its readers concerning the operations today is that it pays regular dividends of $40,000 monthly, and that in last December and August an extra dividend of $40,000 was paid in each month.

THE EMMA STRIKE.—Salt Lake *Tribune*, Oct. 13: It will be remembered that some three months ago a strike of good ore was made in the Emma at Alta. This was tapped by running through the old workings of 13 to 18 years ago, and, carrying this crosscut on through new country a distance of 200 feet, the top of an ore chimney was cut. At that place the chimney was about four feet wide, with a thin streak of good ore. Since then it has been sunk on 125 feet, the vein all the time getting larger until it is now nearly 15 feet wide and has from three to four feet of good ore, with the balance good for milling. A sample lot of this ore was shipped down and lately sold. It assayed 120 ounces silver and 50 per cent lead, and sold for $155 per ton. Connections are being made with other portions of the mine by making an upraise and running some drifts. Now that Alta has about gone into winter quarters, prospecting will go steadily on till next spring, when the Emma ought to begin sending large quantities of ore to market.

FROM THE SMELTERS.—The smelters are finding a much larger local ore output this fall than a year ago, owing to the favorable results of silver and lead legislation. The project for a large smelter in addition to present facilities continues to be not only discussed but regarded as highly feasible.

SALT LAKE SYNDICATE.—The recent big sales at Tintic are having a good effect on outside capitalists and stimulating inquiries as to the merits of different properties in that wonderful district. It is understood now that a Salt Lake syndicate has been formed for the purpose of taking in some of the best properties of the north end, and that some great development work will follow if they get the claims being negotiated for. Work on some of the prospects in that locality is being pushed as vigorously as possible.

COAL FOR THE WEST.—The Rocky Mountain Coal & Iron Co, is shipping coal to relieve San Francisco of its coal famine. Last month they shipped 50 cars of 25 tons each, and shipments are going ahead faster this month. This company supplies the Central Pacific with fuel between Ogden and Carlin, and this takes an average of 750 tons a day. Their mines at Evanston are capable of sending out twice as much more coal, but cars cannot be had for this purpose, and then the Union Pacific has trouble in handling these cars, being so crowded with wrecks and business.

WYOMING.

THE GOLD HILL MINES.—Salt Lake *Tribune*, Oct. 12: The latest from Gold Hill, 23 miles from Saratoga, is to the effect that the discoveries have not been exaggerated. The following is given by J. L. Beagle, an old resident of Saratoga, who has just returned from the mines: "The road from Saratoga to Gold Hill is now completed, the ascent easy and no hills, making it a practicable route at all times of the year. Gold Hill, the summit of the range, is about three miles wide and five in length. The surface does not show many leads. Those are found by prospecting. A light fall of snow while I was there prevented my seeing much beyond the prospect-holes. There is no discount on the camp. Next year will see the largest camp at Gold Hill ever witnessed in the United States. But little more can be done this fall in the way of prospecting. Only assessment work will be done on many claims. Six or eight leads will be worked all winter. The mines are laying in a supply of provisions and will build houses and sink shafts. I would not be surprised if this proved a veritable gold hill in earnest. Sixty claims are taken and the miners feel quite confident. Gold Hill is covered with large spruce trees adapted for lumber and the miners are hardly able to find timber small enough for cabins. The altitude is about 11,000. In my opinion this hill is likely to prove to be entirely composed of quartz. The peculiar formation of the mountain renders the driving of tunnels an easy matter. The mining supplies are obtained at Saratoga, a short distance from the mines, and this is the only possible approach to these mines. The miners of Gold Hill say it is impossible to make a road from any other direction."

MECHANICAL PROGRESS

Nickel Plate for Armor Defense.

Several experiments have recently been made by the U. S. Government to test the relative durability of different kinds of armor plates for resisting the powerful projectile forces which recent progress in gun-making has rendered available. Three kinds of plates are used on ironclads—the Creusot plate, the nickel plate and the Cammell plate.

The two first named are French plates, and the last the plate armor used on English ships of war. The nickel plate stood this test the best of the three. The English plate was battered to pieces. At the last test, almost the whole of the three-inch steel plating had been carried from its iron backing. The shot had gone clean through the iron backing, also the oak supports. The two French plates had not been penetrated entirely.

Inspection at the close of the tests showed the Creusot plate was penetrated and cracked from circumference to center; the nickel plate was penetrated, but intact; the Cammell (English) plate was a wrecked armor. The nickel had proven the superior of the three.

In one of the trials the shot produced no specially damaging effect on the nickel plate. There were more disturbances than in the all-steel plate, but they were in the vicinity of the point of impact, and did not materially shake the reliability of the body of the plate. The projectile rebounded from a cleanly cut aperture.

Secretary of the Navy Tracy, and Admirals Kimberly and Folger, were among those present at the trials. Official reports of these trials state that the tests fully demonstrated the great superiority of the nickel plate over the English Cammell plate, which is manufactured by Cammell & Co. of Sheffield, and is the plate almost exclusively used on all the English armored war vessels now afloat.

The Nickel Plate to be Used by Our Government.

Congress has acted promptly on the results thus obtained, and appropriated $1,000,000 for the purchase of nickel to manufacture armor plates for the new line-of-battle ships. The above and other experiments have shown that when nickel is alloyed with steel, the breaking strain of the metal is increased 30 per cent, and it is rendered incorrosible. The prospects are the Government will secure a supply of the metal from the mines in the Sudbury district, Canada, which are chiefly owned and operated by Americans who can profitably mine the metal for 25 cents a pound. The deposit is an extensive one, and Krupp thought it of sufficient importance to recently make a personal visit to the district.

Improved Nickel-Welded Projectiles.

In this connection it may be interesting to note that the process of electric welding, which has been so widely used in its application to numerous manufactures pertaining to the arts of peace, has now been applied to the production of certain munitions of war in a very remarkable manner. The problem in making a shell for armor-piercing purposes has been to select a grade of steel with a view to its possessing the hardest point for armor-piercing purposes consistent with a chamber whose walls shall not be so hard as to crumble on striking a heavy mass. The metal selected for such purposes has been very naturally the result of a compromise in the endeavor to procure a metal which would give as hard a point as feasible under the circumstances, and yet the limitations of all materials are such that neither object has been perfectly accomplished, and the excessive hardness of the inside of ordinary cast-steel projectiles renders the work of clearing out the interior of the chamber very expensive. This application of the electric-welding process to the production of shells has reached very satisfactory results, entirely beyond those achieved by methods of manufacture hitherto carried on. The armor-piercing point of the shell is made of hard steel shaped in the conical form suited for such a purpose; to this is attached a tube of mild steel forming the chamber. The plastic state of the metal, when the two pieces are pressed together in the act of electric welding, forms a slight enlargement without cutting away any of the walls of the chamber. The butt of the projectile is made of a piece of mild steel, which is somewhat harder than the cylindrical walls of the chamber and is shaped to a cup-form by hydraulic forging. The slight exudation of the metal at the walls on the inside produces an interior ring, which is a material increase in the strength of the projectile.

This new application of the electric-welding process was invented by Lieut. W. M. Wood of the United States Navy, who has received a year's leave of absence, and is in the meantime associated with the Thomson Electric Welding Company. It is stated that the United States Government is ready to contract for a very large supply of these electric shells as soon as the machinery can be made for their manufacture.

COPPER IN STEEL.—Mons. Henri Schneider of the Creusot Works, France, has taken out patents for the process of manufacturing alloys of iron and copper. M. Schneider's plan is first to produce an alloy of cast iron and copper, and subsequently to use the alloy so manufactured to introduce a given amount of copper into crucibles of open-hearth steel. This is done by charging the furnace with copper, scrap and cast iron, making an alloy of from 5 to 20 per cent of copper, according to the purpose for which it is to be employed. The product is said to be remarkable for its great elasticity, strength, tenacity and malleability—properties which may be still further developed by chilling and tempering. This alloy is charged into the bed of a furnace with the ordinary ingredients used in the manufacture of steel, the special details for which are given in his patent specifications. The steel produced according to this invention generally contains from two to four per cent of copper, this being a sufficient quantity to impart to the metal the qualities of elasticity, strength and malleability to a remarkable extent; but the invention is not limited to these proportions. The steels alloyed with copper are especially useful in the manufacture of ordnance, armor plates, gun-barrels, projectiles, and for other military purposes, or in the manufacture of commercial sheets, bars and the like. They may be obtained with varying amounts of carbon, manganese, or silica, or silicium, according to the degree of hardness required and the purpose for which they are employed.

Steel vs. Cast-Iron Water Pipes.

Mr. Jas. C. Bayles, president of the Spiral Weld Tube Co., in a letter to a contemporary, says:

I venture the prediction that the days of the cast-iron pipe are nearing an end. They represent too much dead weight for too little strength. Wise engineers long ago reached the conclusion that the most costly and least satisfactory way of protecting iron against oxidation is with mere bulk of its own substance, and those most concerned in the future of cast-iron pipe, for business reasons, realize most keenly the fact that it is destined soon to take its place among the materials forced into disuse by the progress of the arts. Mr. Hamilton Smith, Jr., who stands very high in the profession of hydraulic engineering, in a paper contributed to the British Iron and Steel Institute, and published in Vol. I of its transactions for 1886, furnished data as to the life and strength of wrought iron and steel pipes for water conveyance, which left little room for further discussion.

The query presents itself: Why should not wrought iron, or still better steel, be used for conduit pipes in preference to cast iron? If it answers the desired purpose in California, why should it not do so in other parts of the world? To one like myself, who has for years been accustomed to the California practice, it seems as irrational to build a pipe, carrying water under considerable pressure, of cast iron as it would be to build a suspension bridge with the supporting chains made of cast iron.

The ideal conduit for high pressures is a welded steel tube; such tubes could probably be subjected to a tensile strain of 25,000 pounds with perfect safety, and would be much preferable to riveted pipe, not only on account of superior strength but also by reason of almost perfect interior smoothness. The adaptation of a superior and cheap metal, such as mild steel, for conduits, will permit the construction of hydraulic works in many parts of the world which now appears to be impracticable owing to the cost of many of the methods still in use for the transportation of water.

THE IRON AND STEEL MARKET.—The Chicago *Railway Review* says: If the railroad companies are not laying as much track as during some other years, they are purchasing other material and supplies in a very liberal way. Throughout the South a great deal of track-laying is going on and the companies are making heavy expenditures for rolling-stock, motive-power, improvements and additional equipment of various kinds. The car-builders and locomotive-builders have been picking up heavy orders within the past few days, and from reliable sources it is learned that several systems will be in the market within the next 60 days for additional equipment, it being the policy of the railroad companies to put their roads in the best possible condition. Three or four of the larger car works are now enlarging their capacity in order to meet the growing demand; the same is true of leading locomotive works. Iron and steel makers report a steady demand, without any fluctuations in prices. Steel-rail contracts are being booked in Pennsylvania mills at from $30.50 to $31.50. Sales of rails for the first seven months of the year, according to the report of the Board of Control, have been 1,273,444 tons, and during the same time shipments have amounted to 826,740 tons. One or two large blocks of German billets have been purchased by American users; domestic makers report a very heavy demand. The lake ore trade is active. Wrought-iron pipe mills are over-sold two or three months. Structural and plate-iron manufacturers report a steady demand. Merchant iron and nails are active. The iron trade outlook for the fall and winter is quite as favorable as it was a year ago.

"PROGRESSO," an Italian contemporary, says iron articles can be protected from rust by sinking them near the negative pole of an electric bath composed of 10 liters of water, 50 grammes of chloride of manganese, and 200 grammes of nitrate of ammonia. Under the influence of the current the bath deposits on the articles a film of metallic manganese, which prevents them from rusting.

SCIENTIFIC PROGRESS.

Electricity and Ozone.

Interesting Scientific Observations of Their Effect Upon Milk.

It is well known, says the London *Times*, that during thunder-storms milk tends to grow acid. An Italian, Prof. G. Tolomei, has lately tried to throw some light on the nature of this action. He experimented with electricity on fresh milk in three different ways—first, by passing the discharge of a Holtz machine between two balls of platinum, inserted nearly two inches apart in a bottle containing milk; second, by sending a battery current between two strips of platinum at the bottom of a U tube holding milk; and third, by subjecting milk in a test tube to the action of a strong battery current through a silk-covered wire, wound spirally round the tube. In each case the acidulation was delayed, not hastened. Three equal portions of milk from the same milking, thus treated, began to grow acid on the seventh, the ninth and the sixth day respectively; while milk not treated with electricity was manifestly acid on the third day. The electrified milk (unlike milk that has been heated to a high temperature, then cooled) coagulates naturally, or by action of rennet, just like ordinary milk.

Having thus seen that electricity could not be the direct cause of acidification of milk, the professor next tried the effect of ozone, and found it distinctly acidifying. In one case the surface of a quantity of milk was brought close under two balls of a Holtz machine, and the milk soon became acid in consequence, the sooner if the discharge was silent (not explosive), in which case more ozone formed. In another case, ozonized oxygen was made to bubble up through a quantity of milk, which in a few hours was completely acid, and soon coagulated spontaneously.

Prof. Tolomei is of opinion that oxygen probably also promotes lactic fermentation (a point which has been disputed). If milk keeps longer in wide, shallow vessels, that is probably due, he thinks, to the cooling produced by evaporation, which is favored by a wide, open surface.

New Fiber Plants.

The discovery of new fiber plants to take the place of such standard fibers as cotton, flax and jute, is constantly being announced; but after attracting attention for awhile they always fall back again into comparative obscurity. The latest announcement of this kind is made in a Savannah, Georgia, journal, which devotes two columns to the discussion of a new substitute for jute, discovered by O. B. Warrand of that city, who has patented inventions for the various processes for working up the fiber into its several uses. This new substitute is a distinctively Southern product, known as the saw palmetto, or palm, which grows luxuriantly in South Carolina, Alabama, Georgia and Florida. Mr. Warrand says that two tons of the green plant will make one ton of dry leaves and stems, and this one ton of dry material will produce $25 worth of tannic acid, $16.25 worth of bagging fiber and $4 worth of fine refuse that can be utilized in paper manufacture; a gross moneyed production of $45 25 for one ton of dried leaves, the material of which will cost not more than $10 to $12. He says that it will require ten tons of green pine straw to make one ton of fiber, and from 13 to 14 tons of cotton stalk, thus showing that the saw palmetto is more productive of fiber, as well as being a less costly material. He says that the two-pound jute is the standard bagging, whereas palmetto bagging weighing but 1¾ pounds to the yard will be as strong as the 2¼ jute, and will not discolor the cotton, as it is claimed the pine-straw bagging will.

Another, is an official report to the Belgian Government which states that the "gulmbobo" or "angu," of the Mexican State of Vera Cruz, possesses a fiber finer and stronger than silk, and of similar luster. Experiments already made are said to indicate that the gulmbobo differs essentially from ramie, cotton and hemp, in having the plant covering around the fiber instead of mixed up and interlaced with it. This makes it practicable to separate and remove the bark by means of machinery. The plant grows luxuriantly with little care and produces highly esteemed food in addition to the fiber.

HARDENING THE EXTERIOR SURFACE OF STONE.—Soft oolitic limestone, or limestone with spherical granules, is now hardened into marble by treatment with a certain chemical solution, which gives to the stone a thick, strong skin about half an inch deep, capable of a fine polish. Soft oolite can thus be worked into any form and hardened afterward. The marble becomes impervious to damp and atmospheric influences.

MYSTERIOUS PICTURES.—Amateurs in photography and chemical magic may get much amusement from the magic photographs described by a French scientific journal. Positives are printed from any negatives upon chloride of silver paper, and are fixed, without toning in any gold solution, in a ten-per-cent bath of hyposulphite of soda. They are next thoroughly washed to remove all trace of the salt. The prints are then placed in a five-per-cent bath of bichloride of mercury, in which the images gradually fade and soon disappear entirely. When the bleaching is complete, the paper is washed and dried. To make the latent images reappear, it is only necessary to immerse the white paper in a five-per-cent solution of sulphits or hyposulphite of soda, or, what is more illusive, to place the bleached photograph on a sheet of blotting paper previously saturated with sulphite of soda, and dip both in pure water. The chloride of mercury is converted into black sulphide of mercury, and the chloride of silver which has formed in the bichloride of mercury is dissolved.

EXHAUSTION OF NATURAL GAS.—Professor Orton of Ohio, in a paper recently read before the American Association for the Advancement of Science, stated that there is not the faintest doubt that the natural-gas supply in the Indiana and Ohio fields is not only exhaustible, but is rapidly and surely being exhausted. He said he had yet to find a man conversant with the existing facts who does not entirely agree with him. The gas is stored in the rocks, where it has been for untold ages. It is not now being generated, and every foot that escapes to the surface leaves the quantity remaining for future use just so much smaller. The pressure of gas in the wells of Ohio and Indiana fields is steadily diminishing, the decrease already having amounted to 30 or 40 per cent. In view of this, Dr. Orton urges the imperative necessity for cities and States to take action restricting the lavish and wasteful use of gas. Even the strictest regulations cannot prevent the exhaustion of the supply of gas in a few years, but they may put off that exhaustion some time.

A CHEMICAL LUNG.—A device which is called a chemical lung is the latest thing proposed for the ventilation of tunnels. It was lately tested in London by fourteen scientists. A room 18x15 was kept for an hour at a temperature of 82° and the air was loaded with impurities. The men of science were now called upon to enter, and the air was made still more impure by burning sulphur and carbonic acid gas. Then the "chemical lung," or punkah, so called, measuring 4x2.6, was set in motion. The temperature was soon reduced to 65° and the air freed from all impurities. Then fat was burned, to test the machine for organic substances, and the "lung" was started up just in time to prevent the examining gentlemen from running out for fresh air. It is proposed to use the invention during the construction of the channel tunnel.

PRECIPITATING SEWAGE.—What promises to be one of the most useful discoveries of the age, says the *Sanitary News*, particularly in reference to sanitary science, and one affecting every living being, is that made by Mr. Woolheim of London, Eng. This is a new method of precipitating sewage, and has been well tested in that country. Ammonia gas is the disinfecting power used, and it is said that when it is introduced into sewage it very quickly destroys the microbes of putrefaction and of many diseases; the odor of the sewage is carried away, and in less than an hour it is both deodorized and sterilized. Dr. Klein supports the discovery and confirms all the claims made by the discoverer. If the discovery should be thoroughly verified it will practically revolutionize the sewage system.

THE *Iron Age* says: Railways controlled by the Government are not beyond the reach of labor disturbance. The experience of Australia, where all railways are built and operated by the Government, is far from warranting the conclusion that State ownership of the transportation lines is desirable. The combination of labor is there more widespread and effective than in America, so effective, in fact, that the Government is compelled to regard the dictates of these organizations in the management of the railways. A strike is quite as liable to happen under State control as under private control, and its consequences are apt to be more serious, because of the political force at the disposal of the strikers.

KNOWLEDGE OF ANCIENT ROME.—The *English News* states that the commission in charge of the improvement of the City of Rome has unearthed great quantities of lead water-pipe, each plainly stamped with the name of the owner of the house, the year of the plumbing, the name of the consuls for that year, and that of the reigning emperor. In opening the 82 miles of new streets in that city, material has been found sufficient to add to our present knowledge a thousand details concerning the baths, heating flues, water pipes and house sewer pipes, the organization of the police and fire brigades, etc.

THE WORK OF THE HEART.—The heart contracts with power enough to send a column of blood 7½ to 9 feet high. At every beat of a heart of average size and strength, the force exerted is equal to moving over 50 pounds, or to lifting a pound weight upward a distance of 3½ to 4½ feet, say 4 feet; or to carry 4 pounds 1 foot upward.

SOUND WAVES.—It is estimated, from a careful microscopic examination of the impressions which the little word "hello" makes on a phonographic cylinder, that it produces not less than 16,000 indentations.

USEFUL INFORMATION.

The Cotton Centenary.

The celebration of the Cotton Centenary at Pawtucket, R. I., beginning Sept. 29th and ending Oct. 4th, was quite a grand and stirring affair. It was in that city that Samuel Slater put into operation the first machinery for spinning cotton that was ever started on the American continent. Mr. Slater is also believed to have been the first person on this continent to establish a Sunday-school; consequently the celebration was made a double one. All the Sunday-schools of the city and neighborhood were invited to take part in the celebration. Mr. Slater has been very properly called the "Father of American Cotton Manufactures."

The occasion was made in part an industrial exhibition, showing the progress which has been made, especially in the cotton industry, during the last hundred years. In addition to the exhibits of modern machinery, there was also a large and interesting display of articles directly connected with Mr. Slater's successful efforts in establishing on the western continent cotton spinning with machinery driven by water-power. Among the collection was one of the identical spinning frames and carding machines built by him on his arrival in Pawtucket 100 years ago; also one of the old hand-looms which were used previous to the introduction into this country of the power-loom, together with the original model of the cotton gin invented by Eli Whitney, as well as one of the oldest cotton gins in the United States. A son and grandson of Mr. Whitney were present on the occasion.

The last day of the celebration was devoted to a "King Cotton Karnival," on which occasion "King Cotton" made his triumphal entry into Pawtucket, and was given the "freedom of the city."

The old, original "Slater Mill," built in 1793, three years after his machinery was first put in operation in a temporary locality, is still in existence and is an object of much interest in Pawtucket. Also the "Old Mill House" in which Mr. Slater lived, and where he commenced his Sunday-school. The occasion was one of much interest and well worthy of such public remembrance.

THE FINEST BROADCLOTH.—It may not be generally known that the finest piece of broadcloth which ever left a loom was manufactured at the Vassalboro woolen-mills of Maine. It was first exhibited at the World's Fair in London, in 1851. It was exhibited at the Centennial in 1876, and was pronounced by the judges in that line of goods as unsurpassed by anything of the kind there on exhibition. There is no public recognition of any other manufacture of broadcloth superior either in texture or finish. It stands to-day unequaled by any goods of its kind on record. This fact is well established, and should be more widely known as evidence that nothing is impossible in American hands which can be accomplished anywhere else. The only reason why these superior goods are not made on a commercial scale is because the high price of labor here forbids it. In this connection we may also state a fact well known on this coast, but not so well known elsewhere, that the finest woolen blankets ever produced in the world were made at the old, but now defunct, Mission woolen-mills, in this city. Those blankets were exhibited at several European expositions, at our own Centennial, and at various exhibitions in this city, and never met an equal in either texture or finish. There is nothing in the world's general produce in the way of skill which Americans cannot attain if they are only properly paid for it.

PENSION MONEY.—The disbursement of pension money by the United States Government from 1861 to 1889, inclusive, has been a fraction over $1,052,000,000. The monthly rates are mostly four, six, ten and twelve dollars to each person. Ohio has the largest number of pensioners; then follow, in order, New York, Pennsylvania, Indiana, Illinois, Michigan, Missouri, etc. There are still on the pension rolls 27 surviving widows of Revolutionary soldiers. The last soldier died some years ago. The rolls also contain two daughters of Revolutionary soldiers, who were made pensioners by special Act of Congress. Three of the widows are 97 years old. The youngest is 71. No record of any other nation ever contained such a remembrance of its soldiers.

BORAX AS AN INK INGREDIENT.—It has long been known that a solution of bichlorate of sodium or "borax" possesses the property of dissolving or softening various resins which are unaffected by plain water and by the great majority of saline solutions. As a basis for a permanent label ink, unaffected by water or moderately strong acids, there is nothing equal to a half-saturated solution of ordinary borax, duly charged with as much orange shellac as it will take up on boiling for 20 minutes.

AN AMERICAN CARPET IMPROVEMENT.—An important improvement in the manufacture of Wilton and Moquette carpets has just been patented by R. B. Loynd of Worcester, Mass.

TENSION OF A HAIR.—That a single hair can support a weight of two ounces, and is so elastic that it may be stretched to one-third of its entire length and then regain its former size and condition, is possible, according to an assertion of the *Southern Critic*.

THE LONDON POOR are justly indignant because the wholesale fish-dealers of that city frequently destroy hundreds of tons of fresh fish in order to keep the prices up.

THE CHINESE, as early as 969, fastened rockets to their arrows so that the latter might be thrown to a greater distance.

BEEF loses 25 per cent of its weight when baked.

GOOD HEALTH.

PREVENTIVE MEDICINE.—It is to be feared that the time is far off when mankind will be wise enough to pay their money for being *kept* in health. The following remarks by Dr. W. W. Johnson, in the *Medical Advance*, are to the point: "We doctors get the most praise when we make the biggest fools of ourselves. When we prescribe accurately and a disease is nursed in its incipient stages, nothing is thought of it. It is passed over as of no great importance, and the chances are that the patient is deemed foolish for calling a physician to such a simple case. But if the prescription be a poor one, as many of them are, and the disease takes its natural course, assuming from day to day its progressive and various symptoms, how changed then the conditions! Nurses and attendants move with bated breath, the friends hang on the words and even the looks of the physician. At last the disease having run its course, nature winning solely through a strong vitality, the patient is pronounced convalescent. Then sound the praises of the doctor. What a mighty man he is! Before his august presence grim Death slinks away and yields up another victim to his mighty power. Herald his fame abroad, that suffering thousands may avail themselves of his sapient skill. Does the doctor know he didn't cure the patient? Yea, verily, let us hope he does. Does he tell the friends of it and bid them hold their peace? Oh no, he's no fool, though sometimes foolish.'

THE USE OF VINEGAR.—Far too much vinegar, says a good medical authority, is used to be compatible with good health. The general belief is that it is a wholesome and necessary adjunct to our diet; but really it might be almost entirely dispensed with except for pickling purposes. If used, it should be used sparingly. A slice of lemon is far preferable as a substitute, and lime may be used if convenient. If vinegar must be used, that made from wine is much more wholesome than that made from cider. In this connection the following upon the effects of acids and alkalies on the stomach from *Good Health* may be read with profit: An eminent Polish physician, Jaworski, has been experimenting to determine the effects of acids and alkalies upon the stomach. He finds that acids precipitate mucus, cause bile to flow into the stomach, increase the amount of pepsin in the gastric juice, but not its acidity, diminish the flow of gastric juice, and in excess, produce disturbances of digestion. Alkalies, on the other hand, dissolve mucus and decompose pepsin. These facts explain the evil results arising from a continued use of vinegar, baking powder, saleratus, soda and similar substances commonly used in cookery.

DEADLY CATERPILLARS.—The Philadelphia *Press* gives an account of a man, 32 years of age, who recently died of blood poison caused by the bite of a common green caterpillar. He was bitten upon the neck as he lay on the grass. The same paper tells of a young lady, 21 years of age, living in Philadelphia, who was at the time in a dangerous condition from the bite of a green caterpillar, which she received while sitting under a grapevine. Severe illness, and even death, is sometimes caused from the bite of a fly. In all such cases, death, or severe illness, is caused by blood poison superinduced by the bite; and it is supposed that insects, usually harmless, whose bites are thus dangerous, have recently come from feasting upon some deceased and poisonous meat or other substance whence the poison virus is taken.

BLOOD TRANSFUSION.—The operation of the direct transfusion of blood, says the New York *Sun*, is becoming quite common in the great hospitals of that city. It is performed as often as once a month, but not always, however, with success. Of late a similar operation—injecting an artificial fibrinated fluid into the veins of collapsed patients—has become still more common. Remarkably successful results have many times been obtained.

A REMEDY FOR CHOLERA. it is claimed, has been discovered by a Frenchman from Cette. People either attacked by or in fear of the disease must sit for some hours in a garment soaked in paraffine, which irritates the skin, producing a healthy reaction, and kills the cholera microbe. Very doubtful.

DEATH FROM SEASICKNESS is so very rare that the case of Mrs. James Pierce of Toronto attracts attention. She never recovered from the nausea induced by a trip upon the Great Lakes.

THE BUILDER.

THE MEASUREMENT OF BRICKWORK.—It is curious to observe how considerably the method of measuring brickwork varies in different parts of the country. In many localities, Philadelphia for example, the custom is to measure it by the number of bricks contained, but this system possesses a serious disadvantage. There is no uniformity in the size of bricks, and hence the size of a wall which a given number of bricks will produce is uncertain. When, therefore, the price per 1000 for laying brick is given, considerable trouble is involved in arriving at the cost for the whole of the brickwork in the building. The better plan is to measure by the dimensions, as is common in some parts of the country. The cubic foot or yard is employed to some extent, but the perch of 25 cubic feet and the superficial rod in brickwork one brick thick are often used. Unfortunately, the term "rod" has no very definite significance. One and a half bricks thick, covering an area of 272½ square feet, and one brick thick, laid on an area of 16½ square feet, or 63 square feet, are all termed "rods." [The English "rod" of brickwork is 306 cubic feet.—ED.] Under these circumstances it would probably be of advantage if the cubic foot or yard could be made the standard unit of measurement for brickwork throughout the country. The number of bricks contained in any piece of brickwork may be approximately ascertained by deducting one-tenth for the volume of mortar.—*Clay-Worker*.

CHARRING PILES BEFORE CREOSOTING.—Wm. Kinnison of the Carolina Oil & Creosote Co., writing to the *Engineering News* on the subject of preserving piles exposed to the ravages of the toredo, says he has become convinced that whatever antiseptic is used to resist the invasion of this destructive insect, piles, before being treated otherwise, should first be thoroughly charred. The destructive temperature to which the exterior of the pile is subjected in the process of charring, kills all germ life existing in the green wood, opens the pores to the absorption of the antiseptic, and surrounds the log with an armor that, so long as it lasts, is impenetrable to the teredo because of the destruction of the nutritive upon which the worms thrive. The perfectly sound condition of the piles in the Government wharf in Charleston harbor, which were charred and creosoted in theyear 1883, is a striking proof of the efficacy of this process. It should be remembered that untreated piles are eaten completely through at Charleston in less than two years by the ship-worm. The Nicaragua Canal Construction Co. has become convinced of the value of charring and has given orders to char all the piles being prepared for the Greytown harbor work at the Wilmington Works.

FIREPROOFING EXTERIOR SURFACES.—It is found that a most effective composition for fireproofing exterior surfaces may be formed by slacking a sufficient quantity of freshly-burned quicklime of the best grade, and when the slacking has become complete, adding such an amount of skim milk or water in its absence as will make a liquid of the consistency of cream. To every ten gallons of this liquid are added, seperately and in powder, and with constant stirring, the following ingredients in the order named: Two pounds of alum, 24 ounces sulphate of potassium, or commercial potash, and one pound of common salt. If white paint is desired, no further addition is made to the liquid, though the whiteness is found to be improved by a few ounces of plaster of Paris. Lampblack has the effect of giving a number of shades from slate color to black. But whatever tint is used, it is incorporated at this stage, and the whole, after being strained through a sieve, is run through a paint-mill. When ready to apply, the paint is heated nearly to the boiling-point of water, and is put on in its hot condition. It is also found that the addition of a quantity of fine white sand to this composition renders it a valuable covering for roofs and crumbling brick walls.

A SUBSTITUTE FOR COMMON BRICKS.—What are termed hollow cast iron bricks form the subject of a recent German patent described in the technical journals, the article being the invention of an Erfurt mechanic. As the name indicates, they are made of regular brick form and size, the walls being 0.12 inches thick, but no mortar or other binding material is intended to enter into their use, the method of fastening adopted being as follows: The upper and lower sides of the bricks are provided with grooves and projecting ribs, which fit into one another easily and perfectly, so as to make a uniform and complete union or combination. There are in addition two large circular openings in the upper side of each brick, arranged to receive suitably formed projections on the lower side of the brick above, one of these projections being also hook-shaped, thus insuring a solid hold; and in order that the joints be made and remain air and water tight, a fluid is applied to the surfaces of the bricks with a brush. The non-conducting air spaces in the bricks, and the ease with which they may be put together and taken apart without injuring them, are cited as special advantages in their favor as a substitute for ordinary bricks and brick construction.

THE LIFE OF TIMBER IN USE FOR BUILDING. One of our exchanges publishes an account of the demolition of the famous Endicott mansion, at Salem, Mass. Built of oak in 1628, its sills, posts, girts, and other framed timbers are still sound, showing under favorable circumstances, that oak timbers, selected with care and properly hewn, may endure for three centuries or more. The famous choir stalls at Rheims are of carved oak, and, it is believed, were completed in 1300. They have received constant attention in the way of oiling and rubbing, it is said, and are to-day in sound condition.

ELECTRICITY.

HOW TO MAKE A STORAGE BATTERY.—The *Journal of the Telegraph* gives the following directions for making a simple storage battery: Get two half-round porous cups, and a round glass jar large enough for the two porous cups to stand in upright. Get two plates of sheet lead 1-16 inch thick, wide enough to fit the half-round side of the porous cups, and deep enough to come an inch or so above the top edge of the cups and jar. Solder a stout copper wire or binding screw to each lead plate at the top. Place the lead plates in the cups and fill the cups nearly full with a paste made of red lead mixed with a solution of sulphate of soda, thin enough to run like a cement. The glass jar containing the two cups should be filled to within a half-inch of top of the cups with sulphuric acid and water, about one part of acid to eight of water. The plates should be marked, so that, in charging, the currents may be sent in the right direction. The cell may be charged by attaching it to a series of a dozen sulphate of copper cells for 24 hours, or from a dynamo. A wooden cover may be fitted to the glass jar, and evaporation of the fluid should be replenished by adding water. Two or more cells of this battery will work small motors, lamps and induction coils; and if thoroughly charged, will retain a large volume of electricity for a considerable time. After once being well charged, four to six cells of sulphate of copper battery will recharge it.

PLATINUM AND ELECTRICITY.—The rapid development of electrical appliances have had the effect to raise the price on several kinds of metal and especially platinum. This metal has been used quite extensively in the manufacture of jewelry, and is quite expensive at the present time, being quoted at $14 per ounce. The reason for the advance in price is said to be chiefly owing to the demand for it by electric-light concerns, and also the fact that the product is growing less. The amount of platinum used in the manufacture of electrical apparatus is enormous. Each electric light contains about six inches of platinum wire, and if the metal is not pure it will not stand the great heat. As the electric light grows more in favor, the demand for platinum is greater, and unless some substitute can be procured, the chances are that platinum will be indeed a precious metal. Here, then, is an opportunity for some inventive genius to put his art to work at good advantage in finding a substitute for this expensive metal, which promises to go even higher than at present.

SMALL MOTORS MOST ECONOMICAL.—The economy of small electric motors for industrial purposes is shown in a shoe factory in Brockton, Mass., where for the last year and a half a 25-horse power motor has been running the machinery. This is being replaced with three motors of 15, 10 and 5 horse power respectively, and a saving of 6-horse power is looked for from the change. The electric-power company that furnishes the current agrees to charge less for the current for the three small motors than it did for the one large one.

ELECTRICITY AND MINING.—An important section in next year's International Mining Exhibition at Frankfort will be a section devoted entirely to mining operations. The different applications of electricity to mining purposes will be demonstrated in such a manner as would obtain in practical work, and this will be the case in all the sections. Messrs. Siemens and Halske of Berlin will have, in addition to three other systems of electric traction, an electric railway for mining purposes in operation.

ELECTRICITY FOR CANAL BOAT PROPULSION. *Electric Power* for September recommends electric propulsion for boats on canals. It says: It is simple enough. Stretch a trolley wire over the canal, put a motor in each boat, locate a dynamo at the different locks and inclined planes, and speed and comfort will follow. Not a pound of steam is needed for the locks, and inclined planes will furnish enough water-power by the aid of water-wheels to generate all the electricity needed to propel every canalboat.

ELECTRIC RAILWAYS.—According to the *Electric Age*, there were, on Aug. 1, 1890, 223 electric railways in operation and under contract in the United States and four in Canada.

INCANDESCENT LAMPS burn out quickly if worked above their proper pressure, and last unusually long if operated a little below their normal voltage.

TO MAKE CEMENT for electric apparatus, mix one pound of beeswax, five pounds of resin, one pound of red ocher and two ounces of plaster of Paris.

TABLE OF CONTENTS.

EDITORIALS. — Farther North Along the "High Sierra;" The Great Iron Producer of the Future, 247. Passing Events; Several Important Events to Stockholders; Brighter Days for Nevada; The Growing Cabinet of the State Mining Bureau, 254. The Columbian Fair; The Tariff on Imported Lead-Silver Ores; Salt-Making Processes; For a Text, 255.

ILLUSTRATIONS.—Longitudinal Section of the High Sierra, 247. Otay Watch Manufactory, 249. Plan of Pan Block for Making Salt, 255.

CORRESPONDENCE—Mad Mule and Other Mines; Evading the Law; The Gold Belt of California; San Bernardino County, 248. A Visit to the Otay Watch Factory, 249.

MISCELLANEOUS.—How to Avoid Strikes; A New Tamping Material for Blasting; Foreign Coin Values; Silver Lead Mines Worked before Christ, 248. Decay of Boilers; The Late Dr. John Percy; For Postal Telegraphy, 249.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 250-251.

MECHANICAL PROGRESS.—Nickel Plate for Armor Defense; Copper in Steel; Steel vs. Cast-Iron Water Pipes; The Iron and Steel Market, 252.

SCIENTIFIC PROGRESS. — Electricity and Ozone; New Fiber Plants; Hardening the Exterior Surface of Stone; Mysterious Pictures; Exhaustion of Natural Gas; A Chemical Lung; Precipitating Sewage; Knowledge of Ancient Rome; The Work of the Heart; Sound Waves; Miscellaneous, 252.

USEFUL INFORMATION.—The Cotton Centenary; The Finest Broadcloth; Pension Money; Borax as an Ingredient; An American Carpet Improvement; Tension of a Hair; Miscellaneous, 253.

GOOD HEALTH.—Preventive Medicine; The Use of Vinegar; Deadly Caterpillars; Blood Transfusion; A Remedy for Cholera; Death from Seasickness, 253.

THE BUILDER.—The Measurement of Brickwork; Charring Piles Before Creosoting; Fireproofing Exterior Surfaces; A Substitute for Common Bricks; The Life of Timber in Use for Building, 253

ELECTRICITY.—How to Make a Storage Battery; Platinum and Electricity; Small Motors Most Economical; Electricity and Mining; Electricity and Canal-Boat Propulsion; Miscellaneous, 253.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 260

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 260.

Business Announcements.

[NEW THIS ISSUE.]

Gold Saving Device—Chas. Trafton, Yankee Jim's, Cal.

Situation Wanted—"Chemist."

Passing Events.

While recent accounts from Alaska are favorable as regards vein mining, the placer miners, especially on the Yukon, appear to have had a bad season of it, the weather having been rainy and otherwise unpropitious.

The labor world continues everywhere in a state of perturbation and unrest; less so on this coast, however, than almost anywhere else. Instead of coming to an amicable understanding or agreeing upon any plan looking to an adjustment of their differences, labor and capital, the laborer and his employer, seem to be drifting all the while farther and farther apart. There is in this cause for deep concern.

Contrasted with these thousands of men going out on strike, there comes from Idaho a call for 2000 men to work on the Cœur d'Alene branch of the Union Pacific railroad.

A notable event in the industrial world is the prospect in this country of immense establishments for the manufacture of tin plate, an article for which we have heretofore paid foreign countries enormous sums annually. The plant already projected will, it is estimated, cost eight or ten millions, the new industry giving employment to many thousand hands. The tin ore for supplying these works will be obtained mainly from Dakota, Wyoming and California.

The weather everywhere on this coast has, during the past week, been favorable for all our leading industries, mining included. A considerable amount of snow has, however, fallen, and much is now lying not only on the summits of the Sierra, but also on all the higher mountains throughout the interior. On some of the ranges in Nevada more snow has already fallen than fell the whole of last winter. From all this there is promised a good water season next summer.

Several Important Events to Stockholders.

Several events took place the past week which may have quite an important bearing on future mining operations on the Comstock lode; the most noticeable of which are first the contest for the control of the Andes Mining Company; second, the questions asked by a stockholder of Con. Virginia Mining Company's shares of the president and directors of the company at the regular annual meeting; third, the forced resignation of Mr. Conradt as superintendent of the Kentuck Mining Company and the appointment of S. L. Jones, superintendent.

The contest for the control of the Andes Mining Company is said to have been made by J. L. Flood, owing to a very rich development on the 800-foot level in Con. Virginia, over 1200 feet west of the latter's shaft. This find, it is reported, is in the Andes grounds. It is said to be the well-defined Red lode which is largely gold bearing. After several meetings, overhauling books and accounts, no change was made in the management of the mine. The only change was in the secretary resigning and in the election of P. H. Andros to the position. The former secretary is reported to be a close friend of Mr. Flood, while the latter is closely identified with M. W. Fox, the principal contestant against Mr. Flood. What the effect of not securing control of the Andes mine, by those who control the Con. Virginia mine, will be on the future of the Comstock mines and also upon the stock market, every reader must be his own judge.

The questions asked by a stockholder at the annual meeting of the Con. Virginia Mining Company are such as could be readily answered by the officers here, provided they demand detailed information in the interest of stockholders, of all workings at the mine. The questions were referred to the superintendent at Virginia City to answer, at his earliest opportunity.

The changing of the superintendent of the Kentuck mine brings that historic ground to the front. The company owns 95 feet of the Comstock lode between the Yellow Jacket and the Crown Point mines at Gold Hill. This 95 feet is probably one of the most interesting locations on the lode. It claims the distinction of being the piece of ground in which John W. Mackay and the late U. S. Senator Sharon made their first money on the Comstock and which was the nucleus of their subsequent large fortunes. In those days all stockholders were permitted to share, pro rata, in the profits of the mines, which profits came to them in the shape of dividends. This was in the sixties and seventies.

In 1881 a new order of mining was inaugurated on the Comstock lode evidently, as past events prove, to kill off all outside or small stockholders in the mines. It was in that year Mr. Conradt (superintendent of the Kentuck mine, who was forced last week to resign), then foreman of the Kentuck mine, while making a manway on the 160-foot level to connect with the Yellow Jacket mine to afford a means of escape for the miners in case of accident, came on a narrow body of high-grade ore, selected samples of which assayed about $400 to the ton. The knowledge of this find was kept from other stockholders by the late C. C. Stevenson, who at the time was superintendent of the mine. When the latter person had purchased enough stock to give him the control, he had his broker, H. H. Noble, put from five to ten shares of the stock in the name of five men who were elected trustees of the company. These men in their official capacity signed a contract with C. C. Stevenson, whereby the property and the body of newly discovered ore were made the property of the contractor. They even went so far as not to appoint a superintendent to look after the interest of other stockholders.

A few of the outside stockholders filed a complaint in the courts exposing the fraud, and after a prolonged trial, the court ordered an accounting by Stevenson to the plaintiffs. The whole matter was referred to a referee. Stevenson and his dummy-directors finding themselves cornered, settled with the stockholders who brought the suit at the rate of $40 per share and the costs of suit.

It may be of interest to stockholders in the Kentuck Mining Company to know that the now president of the company is the same president who voted for the contract with C. C. Stevenson, and who admitted that 2000 shares of the stock standing in his name as "Trustee" belonged to the contractor and was simply held in trust by him. Besides this, a majority of the Board of Directors to-day are the same men that renewed from year to year the illegal contract in defiance of the protests of other stockholders.

This same ore-finder, Mr. Conradt, has lately discovered another body of rich ore. His letters on file in the office of the company in this city show assays ranging within the past thirty days from about $40 a ton to over $1000 per ton. Since finding this body of ore Mr. Conradt has been removed. This removal awakens suspicions that he was giving away too much information. His removal also causes many to think that possibly if he had been retained as superintendent, the ore could not have been either successfully hidden or spirited away by the mill ring, and outside stockholders assessed to pay for its extraction and milling.

The course of the new superintendent, S. L. Jones, will be watched with unusual interest to see what he will do toward developing the new and important ore body.

Brighter Days for Nevada.

As is generally well known, the State of Nevada has, for a number of years past, been far from prosperous, her population having been steadily decreasing, and all her material interests apparently on the wane. Last winter more than decimated the flocks and herds of her sheep and cattle men, giving what was considered the finishing blow to this branch of business. The bullion product of the State, though showing some little increment during the past few years, has still remained comparatively small; and thus with all her leading industries stinted and crippled, her mines neglected and her population diminished, the once-renowned "Sage Brush" State has become the subject of sneers and slurs, it having been the fashion of her enemies to reproach her as being a rotten borrough, with other contemptuous names applied to her.

Now, while the decadence of our sister State has, no doubt, been marked and general, it is pleasant to know that it has not become chronic nor yet that the evils complained of are constitutional and incurable. We have it on good authority that a change for the better has recently come over the condition and prospects of Nevada. Her crops of both fruit, hay and grain have the present year been exceptionally good, the latter having been so abundant that after supplying all home wants she will have some breadstuffs to spare. Save in a few places, not much can be raised in that State without irrigation, recourse to which has as yet been had only on a limited scale. But movements have been inaugurated for utilizing more and ultimately all the water available to that end. When this shall have been accomplished, Nevada will be distinguished for the amount and excellence of her cereal products, as good flour having been manufactured from her home-grown wheat as any made in California. The apple, plum and like hardy fruit can also be grown there to perfection, the "Washoe" potato, as we all know, being the very best that has ever found its way to the San Francisco market.

Moreover, there is some improvement visible in the mining industries of Nevada, both on the Comstock lode and in many of the outside districts. More railroads are likely soon to be built, reaching to remote localities suffering now from lack of cheap transportation. The railroad approaching the eastern border of the State from Salt Lake will be of great service to that region, which abounds with mineral wealth of various kinds.

The Growing Cabinet of the State Mining Bureau.

The following mineral specimens, coins, curiosities, etc., were donated to the State Mining Bureau during the month of September last:

Hessite (telluride of silver), Keystone mine, Carson Hill, Calaveras Co., Cal.; H. W. Fairbanks.

Aragonite (car calc), Tolemas Springs, Solano Co., Cal.

Gypsum (hyd. sulph. cal.), near Ravenna, Los Angeles Co., Cal.; J. Robertson.

Gold quartz, Atherton mine, Tioga district, Tuolumne Co., Cal.; E. E. Haft.

Epidote crystal (silicate, etc.), from group of quartz crystals, south side Mt. Hoffman, Mariposa Co., Cal.; Geo. E. Sprague.

Garnet, almandite (silicate, etc.), same locality and donor as last preceding.

Antimony ore (stibnite), Greenhorn Creek, Kern Co., Cal.; A. Blanc.

Copper, native, in quartz with melaconite, Satellite mine, Calaveras Co., Cal.; J. Z. Davis.

Asbestos (silicate, etc.), American Excelsior Consol mine, Goodyear's Bar, Sierra Co., Cal.; Robert Stuart.

Indian stone ring, Santa Catalina Island, Los Angeles Co., Cal.; Benj. Hill.

Pilinite (hyd. silicate of aluminum, calcium and lithium), New Almaden mine, Santa Clara Co., Cal.; J. B. Randol.

Mineral paint (hematite), Santa Rosa, Sonoma Co., Cal.; A. W. Dana.

Quartz, showing free gold, Cerros Island, Mexico; Mrs. C. Wilson.

Chromic iron, near Calistoga, Napa Co., Cal.; S. W. Fee.

Iron ore, magnetite, junction of McCloud and Pit rivers, Shasta Co., Cal., large deposit adjoining limestone; Wm. P. Miller.

Fire-clay, Mount Cliff, Sonoma Co., Cal.; S. W. Mayer.

Japanese gold coins, Nishu Kiu; T. Kitsunesaki.

Moonstone, Point de Galle, Ceylon; B. A. de Saba.

Pandermite, Death Valley, Inyo Co., Cal.; R. S. Dunn.

Fiorite, Yellowstone Park, Montana; J. Z. Davis.

Pearl sinter, Yellowstone Park, Montana; J. Z. Davis.

Roofing slate, Kelsey, El Dorado Co., Cal., Jacob Strahle.

Pebbles, rough and polished, Pescadaro Beach, San Mateo Co., Cal.; Sam'l Somenfeld.

Silver ore, Cashier mine, San Bernardino Co., Cal.; Wm. K. Aldersley.

Sapphires and garnets, El Dorado Bar, Montana; Geo. O. Nettleton.

Besides the above there were donated to the Bureau during the past month a large number of mineral specimens of various kinds, some of them of great scientific interest and a few of much intrinsic value, and thus does the magnificent cabinet owned by the people of this State grow month by month and day by day, these voluntary contributions, like the number of visitors to the Bureau, being constantly on the increase. It might be well to remind the public that this collection, which is a museum of curiosities and an art school as well as a scientific cabinet, is open daily, admission being free to all. Our youth should not only be allowed but encouraged to visit the Bureau as containing matter for both instruction and amusement.

All the several kingdoms of nature, the animal, the vegetable and the mineral, are here represented. Not only so, but there can be seen in this vast collection something from each of their various departments. Here, in well-preserved form, deftly mounted and well displayed in handsome cases, are birds of rare and beautiful plumage, monsters of the great deep, and strange fishes that swam in the primitive seas; the remains of gigantic animals, enormous tree growths, hideous reptiles, and other fossils belonging to races and creatures of prehistoric and even early times.

In this cabinet archæology comes in for a share, there being here rare coins both ancient and modern; mummies from the catacombs of Egypt; classic urns and statues; domestic utensils from the excavations of Pompeii and bricks from the tower of Babel. There are casts of all the famous gold nuggets wherever found; Indian relics and meteors, erratic wanderers, shot from far-off worlds that striking our earth have been arrested in their aimless flight through space.

But to name or even indicate in the most general way all that can be seen in this great receptacle calculated to interest both the learned and the unlettered, would require more space than we have at our disposal. Suffice to say, there is here something to gratify all, and the Bureau being so open to every one, should become a place of general resort for both old and young. That its advantages are meeting with wide appreciation is shown by the multitudes that throng the place every day; the attendance being now twice as large as it was only a year or two since.

At the rate the donations have been made of late, Mr. Irelan, the State Mineralogist, will soon find himself crowded for room, nearly all the available space in the vast apartment occupied by the Cabinet being already filled. By the time what room is left shall have been filled, the Legislature will no doubt provide a suitable building for the reception and preservation of this valuable collection and the general uses of the Bureau.

The Columbian Fair.

Satisfactory progress seems now to be making in preparation for the great World's Fair in Chicago. The Commissioners are in continual session this week, and telegrams show that preliminaries are being rapidly arranged. George R. Davis has been chosen director general, and he issued on Tuesday of this week an address which gives official information concerning the enterprise as follows:

By an Act of Congress it is provided that the buildings for the World's Fair shall be dedicated on Oct. 12, 1892, and that the exhibition shall be open to visitors on the first day of May, 1893, and shall close not later than the 30th of October thereafter. Thus we have two years in which to arrange the grounds and erect the buildings, and seven months additional in which to receive and place the exhibits. So far as this country is concerned, the undersigned feels justified in the statement that the presentation of agricultural and stock products will be in every respect superior to any previous exhibition; also, that in inventions the progress of the United States will be indicated in a most remarkable manner. There is also every reason to anticipate exhibits in large numbers from every other nation on the globe, it being estimated by practical experts that the total number of exhibits will not be less than 50,000, divided equally among the United States and all foreign nations.

It is proposed to make this exhibition especially interesting in all that relates to manufactures by the presentation of the most important processes in active operation. In comparison with these will be presented the methods used in other countries for a hundred years past. Already there are indications that nearly every State and Territory in the Union will be fully represented and that large appropriations will be made at the approaching sessions of the different State Legislatures. Circulars and blank applications for space will be forwarded in due season to all intending exhibitors.

No doubt California will be creditably represented at this grand display, as probably she can invoke no more potent agency for the dissemination of knowledge of her unequaled resources and productions. An organization, as previously stated in the PRESS, is now at work to this end, and the Legislature this winter will be called upon to furnish substantial and adequate aid. There seems to be general consent that the California display must be original in design, unique in development and striking in its impression. It will, of course, take time to determine how this can be done and at what outlay. We acknowledge that we have been very favorably impressed with a plan worked out by E. W. Keeler of the State Board of Trade, which is a happy combination of panoramic representation of characteristic California scenery, with display of material products in a way which it seems to us will give the visitor a realizing impression of California's charms and adaptations. No doubt due attention will be given to Mr. Keeler's proposition and to all others which may be presented.

A MEXICAN is in jail at Tucson for cutting timber on the Ft. Thomas Military Reservation.

The Tariff on Imported Lead-Silver Ores.

In the last issue of the PRESS we presented the views of the lead miners and the reasons why they should be protected against the low rate of wages paid to miners in Mexico. As stated in the concluding paragraph of that article, we this week present the views of the smelters who require the class of ores obtained from Mexico and of those who desire cheap lead and therefore favor the free importation of these ores, for which reason they oppose the new tariff. A great many miners say these parties produce ores chiefly valuable for silver, but which contain a small percentage of lead—not enough, however, for a flux. There is also a large class of ores carrying both gold and silver which require to be reduced by the smelting process, but which are so deficient in lead that from 18 to 20 per cent of this metal must be added in order to reduce them successfully by that process. In other words, the best results are obtained by adding to ores deficient in lead others carrying an excess of that metal. For this reason ores carrying 40 per cent or more of lead are especially desirable for the smelting companies, as to each ton of these may be added a ton of ore which contains no lead. Probably more than one-half of the ores treated by the smelting process are deficient in lead; these can, therefore, be treated most economically and the lead ores most profitably by being combined and smelted together. The presence of iron and lime is also necessary as a flux, and the fact that these various substances are seldom combined in one mine has led to the establishment of large smelting plants located at points central to mining districts, where ores can be sent and sold by the producer. As these smelting companies will buy ores in any quantity and of any grade, so long as they contain value enough to pay cost of treatment, they are of the greatest service to the miner, enabling him to ship a carload of ore or even less and thus realize on the product of his mine from the start. That ores carrying a high per cent of lead are not always available to the smelting companies is clearly proven by the fact that they will give a net price for them much nearer their assay value than for "dry ores," or ores carrying little or no lead. The price of lead has recently advanced two cents per pound for no other apparent reason than that lead which has heretofore come into the country in silver ores free of duty now pays a duty of 1½ cents per pound. This will probably make no difference to the smelting companies. It will, however, to the miner, who will have to pay this tax in the form of an increased charge for the treatment of his ores which carry no lead. If this latter class exceed in number the lead-miners, then this new tariff is a mistake, viewed only from a standpoint of the greatest good to the greatest number engaged in the mining industry.

The smelters say they have invested large sums in the construction of reduction works, locating their plant in many instances with reference to facility for obtaining this class of ores from Mexico, and that to now practically exclude these ores must work them a great hardship, some of the parties so complaining hinting at the possibility of their transferring their plant to the Mexican side of the line if relief is denied them.

If this tariff is to be maintained they affect to believe there will not only grow up a great smelting industry in our sister Republic, but that the latter may be provoked to legislate to the prejudice of both this and other of our industrial pursuits.

Salt-Making Processes.

NUMBER 1.

We make many thousands of tons of salt in California every year, altogether from the evaporation of the salt waters of the bay. We have described the methods employed here in previous numbers of the PRESS. Mr. Thos. M. Chatard, of the U. S. Geological Survey, has written a monograph on the "Salt-Making Processes" of the United States, and we have reproduced some of the engravings from his work. In examining and comparing the different processes we shall find that they fall into three groups, according to the character of the heat employed and the mode of application: (1) Use of solar heat, or solar salt manufacture; (2) direct artificial heat, or kettle and pan processes; (3) steam heat, or graduer methods.

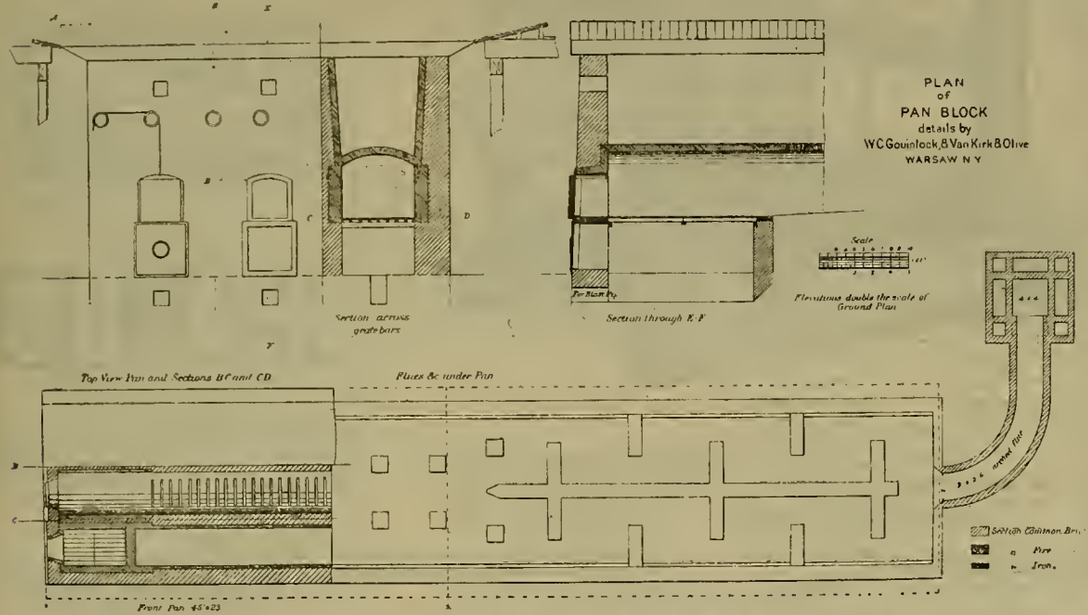

Fig. 1.—PLAN OF PAN BLOCK FOR MAKING SALT.

The pan process, long known in Europe, was introduced in Syracuse, N. Y., in 1852, but was soon abandoned, although there is no reason, considering the composition of the brine, why proper arrangements should fail to give good results. In other sections pans are extensively used, and Fig. 1 represents the usual form. The pan is 100 feet long, 23 feet wide, and 10 inches deep, and is divided by a cross-partition into the front pan, 45 feet long, and the back pan 55 feet. The sides of the pan incline outward and meet the draining boards which extend along the sides. The foundations are of stones, the furnace walls of common brick with linings and arches of firebrick. A forced draught, supplied by a rotary blower, is used, and the fuel is anthracite slack burned on a perforated grate. The dimensions and other details are indicated in Fig. 1, made from sketches and information kindly furnished by Dr. W. C. Gouinlock and Messrs. Van Kirk & Olive, of Warsaw, N. Y.

In some cases the grates are put in on an incline, the back being the higher part, and the arch is made much shorter than in the drawing, say 10 feet. Bridge walls are also used, but in most cases are absent. The pans are made of one-fourth inch boiler iron, riveted and calked, and are supported by the outside walls, by the division walls between the fires for a certain distance, and beyond that, by piers succeeded by a system of deflecting walls designed to effect a more thorough utilization of the heat. The fire gases pass to the stack, which is intended to be used for two pans and is placed midway between them. Where the pan is divided into front and back pans, as in the drawing, the brine is brought to complete saturation in the back pan, depositing a portion of the sulphate of lime and then passing into the front pan, where the salt is made, usually at boiling heat (220° F. = 105° C.).

Another arrangement of flues is that in which two fires are used for each pan, the division wall between them running the entire length of the pan. On either side of the central wall, midway between it and the side walls, is a wall running parallel with it and extending from the front wall to within a short distance of the rear wall, making two sets of two flues each. At the front ends of the two central flues are the fires, the fire gases passing along the central flues to the end of the pan and returning by the outside flues to the front. In this arrangement the stack is at the front.

For a Text.

Taking for a text the fact that two-dollar auriferous quartz can now be mined and milled in California at a profit, an interesting sermon might be preached therefrom on the possibilities of gold mining in this State. When we commenced this branch of mining in California, quartz carrying free gold to the value of $50 per ton was considered about as low-grade ore as we could then afford to handle, $30 rock being thrown aside as utterly worthless.

So costly then were labor and the other factors of production, so imperfect our machinery and methods, and such our ignorance of the business, that after we had followed quartz mining for a few years, much money having been spent in the interim to promote it, this industry, instead of growing and prospering as was expected, actually went into a decline, and for a long succession of years idle quartz-mills and abandoned mines were to be seen all over California.

But at length there came a change; not marked or rapid at first, but a change that in good time served to restore life to this business and finally insure for it a lasting and cumulative prosperity.

Vast and diversified are the material resources of California. Boundless the opportunities presented here for the profitable employment of capital and labor. All our leading home pursuits are destined to undergo early and rapid expansion. There can be no doubt of this. We have already entered on this the stage of our second growth. But on none of these domestic industries does there await such phenomenal growth as that reserved for the business of quartz mining. It is the one thing in which we have the raw material without stint, unexampled facilities for its prosecution and that cannot be overdone.

Who can measure the two-dollar per ton gold-bearing quartz to be found in this State? Who can measure even the extent of our auriferous territory? We know our principal gold belt covers an area of 20,000 square miles or more, besides which we have several minor gold-fields whose aggregate area is nearly half as large. We know this whole territory abounds with auriferous quartz veins, but we know little about their extent because not one in a hundred has yet been exploited to any great depth. A hundred years hence we will be better informed on this point. About that time our people, more fully advised as to the extent of our auriferous wealth, will be wondering why we of the present generation were so seemingly indifferent to its existence and so slow to turn it to practical account.

THE brick war in New York has come to an end. Since July it has seriously curtailed the manufacture of brick and materially impeded building operations.

THE Pacific Electrical Storage Company has closed a contract for a 600 light plant for the Hotel Pleasanton, on Sutter street, in this city.

THE Illinois State Fair opened last week at Peoria with an attendance of 75,000 persons, 38,000 strangers being present.

THE works operating on the shore of Owen's Lake, Inyo county, are turning out large quantities of soda.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents.

Preface; Introduction; Implements; Assay Balance: Materials, The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay, Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation, Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation, To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus, Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthat; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur, Assay of Salt; Appendix to Part I, Notes on Crucible Assays, Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

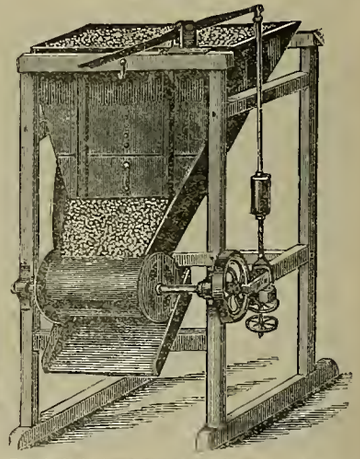
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

MANGANESE AND IRON FOR BRAKE-SHOES.—A serious objection to ordinary car brake-shoes as made of common cast iron is their rapid wear and deterioration, necessitating the making of such shoes heavy and cumbersome in the first instance, the frequent removal and replacing of shoes, and the discardiug of the shoes before they are nearly worn out. Many efforts have been made to overcome these defects by alteriug the construction of the shoer, making shoes of compound parts, some of the parts of hard material, etc., generally with a considerable increase in the cost of the shoe and complexity of construction. Mr. W. W. Snow, of Hilbnrn, Rockland county, N. Y., in conducting a series of tests to produce an effective but comparatively inexpensive substitute for the ordinary cast-iron shoes, found that while an addition of about three to five per cent of manganese to ordiuary pig metal produces a soft and ductile metal, an increase of the manganese to from eight to ten per cent greatly hardens the product, imparts great toughness and durability under friction and abrasion, and a brake-shoe made therefrom, while it can be cast in the ordinary manner and at practically no increase in the expense of prodnction, is so much more effective than one of ordinary cast iron that it may be made comparatively light in weight, used so long as sufficient metal remains to preserve its shape, and the usual expense of constant removals and changes is avoided. The most effective characteristic claimed for the shoe thus made is its durability, resulting from a peculiar combination of toughness and hardness, which enables it to withstand the friction and abrasion to which it is subjected.

STEEL FITTINGS FOR AIR BRAKES.—The Westinghouse Air Brake Company has used for over two years steel fittings for air-brake piping to the exclusion of galvanized malleable fittings, and has found them very satisfactory. Galvanized fittings of the best manufacture have given considerable annoyance, while the steel fittings are found to be air-tight, the threads full and sharp and accurately tapped, making these fittings the best in all respects for air-brake service. As is known, the company has recently adopted the policy of not selling pipes and fittings, but it recommends to its customers, as we understand, the steel fittings. The difficulty of maintaining perfectly air-tight joints in train piping is very great and the ordinary run of malleable fittings are not only imperfect in gange, but often so imperfect in finish as to permit serious leakage. The difference in the price of steel fittings and those of malleable iron galvanized is nominally not great, while probably it is often more than made up by the number of malleable fittings found defective and rejected. Steel fittings are now used by many railroads, and also by contracting car-builders. Various roads are also using them for locomotive work, in sizes of from ¼ to 2 inches, having found them economical in connecting up and also in maintenance.—*National Car and Locomotive Builder.*

Testing and Working Silver Ores
A VALUABLE BOOK.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krochinke's process, etc. Under "Pulverizing Machines" are described leaching arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Taylor, J N, Trustee	532	1,040	62 40

And in accordance with law, and an order of the Board of Directors, made on the 25th day of August, 1890, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Room 11, No. 303 California street, San Francisco, California, on MONDAY, the 20th day of October, 1890, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. W. BARROWS, Secretary pro tem.
Office, Room 11, No. 303 California street, San Francisco, California.

EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4100 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK, SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. Willis E. Everette, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance*.
H. S. SPAULDING, Publisher.
T. C. HOCKING, Editor.

LAND
WORTH LOOKING AFTER
—AND—
Likely to Double in Price Soon.

FINE VINEYARD
CHOICE FRUIT
RARE RAISIN
AND ALFALFA
LAND

EXAMINE THIS RARE CHANCE.

A well-cultivated farm of 480 acres, inclosed with 7 miles of fencing and cross fencing, with first-class improvements, 7-room, two-story, hard-finished house, nearly new, large barn, blacksmith shop, milk house, grain house and other outbuildings; 7 acres of bearing orchard; 30 acres of alfalfa; large flowing artesian well of splendid water, and first-class surface wells of water; pleasantly located 7 miles from Tulare City; is offered for sale at little or nothing for cost of improvements by the owner, who has engaged in other business. This property is offered for $20 to $30 per acre, on easy terms.

The readers of this journal are assured that this chance is worth looking after. Parties in San Francisco who know the property can be referred to through the Publishers of this paper. LAND OWNER.

For sale by A. T. DEWEY, 220 Market St., San Francisco.

DEEP WELL PUMPS

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

A New and Splendid Companion to all the Metal Industries.

Fully abreast of the latest inventions and discoveries, as well in the largest and coarsest as in the smallest and finest of metal work.

TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

DEANE STEAM PUMP.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE, which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

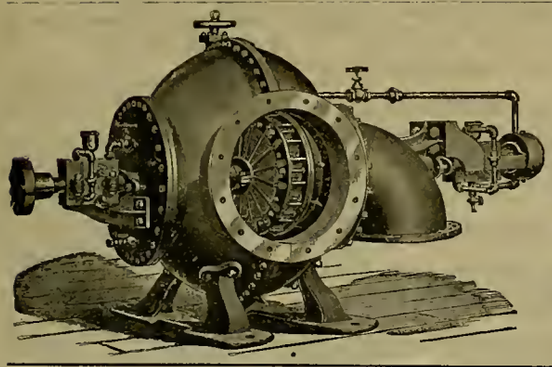
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Extra sizes and lengths made to order on short notice,

611 & 613 Front St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 16, 1890.

The past week has witnessed contioued activity in all lines of trade. Those branches which are affected by the higher duties were the most active. The local money market is fairly easy. The demand is slow, and no increase is looked for until after election.

MEXICAN DOLLARS—The market is dull at 85 to 86 cts.

SILVER—After a silence of about two weeks, the Treasury is making the silver purchases public. The purchases on yesterday were telegraphed as follows: The amount of silver offered for sale to the Treasury to-day was 436,000 ounces, and the amount purchased 275,000 ounces, as follows: 75,000 ounces at $1.0959, and 200,000 ounces at $1.0969. The Mint's counter rate to this city has been $1.09¾ per ounce. To-day New York and London telegrams report public quoted prices for silver slightly higher —$1.09 in New York and 49¾d in London. In our market very little silver is offering—held for expected better prices later on. All that is being sold is done so under pressure.

QUICKSILVER—Receipts the past week aggregate 224 flasks domestic and 100 flasks from London. The exports by sea aggregate 30 flasks to Mexico. The market is steady, with a continued fair demand reported.

BORAX—Receipts aggregate the past week 258 ctls. The market is reported firm under improved advices from the East.

LIME—Receipts aggregate 2577 hhls. the past week, and exports by sea 100 hhls. to Honolulu. The market is quiet but steady.

ANTIMONY—The market is easy. New York advices report an easier market.

LEAD—The market is very stiff at full quotations. New York advices report a firm, strong market at 5¾ to 5⅞ cts., with now and then 6 cts. paid. The demand is said to be fair, while the holding is strong.

IRON—The market is steady under a fair quantity being taken by foundrymen and others. Compared with last year, it is said that more is going into consumption.

TIN—The market is strong for plate at an advance, due to the tariff, but weak for pig, due to its coming in free of duty. The demand is slow. European advices, while reporting the market more or less unsettled, give a healthy tone.

COKE—Imports by sea the past week aggregate 200 tons from Swansea. The market is firm for spot.

COPPER—Exports the past week aggregate as follows: Honolulu, 746 lbs.; Mexico, 1570. The market is reported firm. At the East, contract sales are reported of Lake at 17 cts. for the remainder of the year. Some straggling parcels are being picked up at 16¾ cts. The general tone to the market is healthy, notwithstanding light business.

COAL—Imports the past week aggregate as follows: Nanaimo, 3692 tons; Seattle, 4529; Newcastle, N. S. W., 1805; Swansea, 1597; Philadelphia, 100; New York, 112; total, 11,835 tons.

The coal market for both spot, to arrive and for loading is very stiff, with an advance obtainable for some kinds. The demand is quite active for steam, gas and household coals. The supply on hand is light, as is that to arrive. Australian advices report the strike still on.

Mining Share Market.

The market the past week dragged at fairly unchanged prices up to yesterday, when a weaker tone set in under a hear raid by inside brokers offering small quantities, 5 to 20 shares, of Savage and Chollar at reduced prices. This had the effect to bring in outside sellers whose stocks were quickly taken. This (Thursday) morning the market opened weak for the middle aod north end shares, which was followed by a slight shading in prices after hoard. The manipulation shows on its face to have been done for the purpose of uncovering margined stock, and also bringing in cash sellers. For the points, the past three weeks have been "break," "break," but every share offered was readily taken. Some fair-sized blocks ranging from 500 to 1000 shares found buyers without breaking prices. It now looks as if the shading off to-day is the first move for an up market, based on stocks well in hand, important work in the mines and a certainty of development soon.

In outside stocks there is a strong tone under steady buying orders. Quijotoas show a slight advance, as do the Tuscaroras. The Bodies hang around last week's higbest prices. In the Tuscaroras, North Belle Isle and Belle moved up the most under a reported improvement in the latter mine.

The contest over the control of the Andes mine has received considerable attention, which evidently attracted some notice from the stock market. What the outcome will be it is hard to say. There appears to be a three-cornered fight free to all newcomers.

From the Comstock mines the news is growing more interesting. The crosscuts, particularly to the west, being run by several of the mines, are approaching the important sections from which good results are expected. While many experienced miners do not look for any material change for the better until some time next month, yet there are those who say that a strike is liable to occur any day. An important strike is what is required to start the stock market on a good, solid boom. It is stated that the Comstock Tunnel Co. is likely to commence operations at an early day on the lode. In Sierra Nevada they ought to be near the $30 ore lying to the west. In Best and Belcher the northwest crosscut ought to be near the good milling, running from Con. Virginia. The work going on in Ophir, Savage and Chollar needs close watching. Those in position to know are looking with confidence to good results from the work going on in the Gold Hill mines. The pump is working satisfactorily, but owing to slides or caves in the shaft, slow progress is being made. The Altapump has not started up—perhaps the managers of that group have legal fees to pay so as to absorb the moneys received from assessments, hullion, etc., after which start the pumps up on more assessments. The south drift from the Potosi winze running toward Bullion has been stopped. It was in $15 ore when stopped. Official letters received today from the Gold Hill mines are of the same tenor as noted in last week's issue.

From the outside mines our advices report continued good news from the Quijotoas. From the Tuscaroras a decided improvement is reported in North Belle Isle, and highly encouraging prospects of improvements in two or three other mines. From the Bodies our advices are confirmatory of a decided improvement in the Bodie in the winze below the 700-foot level. Our correspondent is very sanguine of the best results from the enlarging work now going on. More miners are being put to work. The official letter from the mine reports the mill working satisfactorily. Some rich ore is being taken out. The Standard mill is running satisfactorily and on good ore. In the Silver King mine, Arizona, an important strike is reported.

Eastern Metal Markets.

By Telegraph.

NEW YORK, October 16.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	49½	1 10½	$16 75	$5 90	$23 00
Friday	50	1 10	16 75	5 90	23 00
Saturday	50	1 10½	16 75	5 90	23 00
Monday	50	1 10	16 75	6 00	23 00
Tuesday	49¾	1 09½	16 75	5 90	23 00
Wednesday	49¾	1 08¾	16 75	6 00	21 35

NEW YORK, October 14.—Quicksilver is firm at 79@82c. Concentrated Bnrax is scarce. California refined and powdered, 9½@9¾c. Large contracts are reported in Lake Copper during the remainder of the year at 17c. Arizona is easier at 16½c; casting 14½@14¾c. Pig Lead is scarce on domestic, and the absorbed foreign caused a strong upward tending in prices. Carload lots sold at $5.76@5.90. For small lots $6 is asked.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 7, 1890.

437,766.—GATE—J. A. Bacon, Phœnix, A. T.

438,062.—SAWMILL SET WORKS—E. T. Davies, Portland, Or.

437,888.—HARNESS TOOL—Henry Eghers, S. F.

437,984.—BURGLAR ALARM FOR CLOCKS—C. O. Farciot, S. F.

437,890.—HOSE-COUPLING—A. T. Gilhert, Salem, Or.

437,891.—GRAIN-CLEANER—John Grider, La Grange, Cal.

437,895.—BASEMENT, ETC., CONSTRUCTION—P. H. Jackson, S. F.

437,903.—SAFETY POCKET—E. Jacohs, Petaluma, Cal.

437,834.—VEHICLE BRAKE—W. H. Kaseberg, Wasco, Ogn.

437,862.—PLASTERERS' TOOL—Kelly & Williams, S. F.

438,085.—VALVE GEAR—F. S. McKibhen, Joseph, Or.

437,865.—OIL CAN—P. J. Moore, S. F.

438,016.—DISPLAY BOTTLE—T. H. Palmer, San Bernardino, Cal.

437,717.—DEVICE FOR TRANSMITTING MOTION—C. A. Palmquist, Spokane Falls, Wash.

437,871.—PIPE MACHINE—F. M. Speed, S. F.

437,945.—LATHE ATTACHMENT—W. Swahel, S. F.

437,875.—CONCENTRATOR—C. W. Tremain, Portland, Or.

437,878.—HAT-FASTENER—P. N. Tryon, S. F.

437,805.—BARBED WIRE—W. T. Walton, Mayville, Or.

438,126.—MOUNTING GLOBES—M. Wheeler, S. F.

437,879.—SCHOOL RULER—W. H. H. Wright, S. F.

The following brief list by telegraph for Oct. 14, will appear more complete on receipt of mail advices:

California—Mablon K. Biser, Los Angeles, washing machine; Nelson Giles, Jr., and L. E. and W. E. Brown, National City, insecticide; John Hander, S. F., fly paper; Ellsworth D. Middlskauff, Stockton, churn; James M. Miller, Vacaville, verge wire for clocks; James R. Phelps, Sacramento, harness; John M. Pray (assignor of one-half to H. H Liethead), Los Angeles, pipe-tongs; Joseph F. Prizgent, Los Angeles, shirt-measuring appliance; George C. Richards (assignor of one-half to W. T. Tuckwell), Sisson, tire-tightener; John C. Shelley, Stockton, cable railway; Thomas W. C. Spenner, S. F., automatic throw-off for cable-grips.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SCHOOL RULER.—Wm. H. H. Wright, S. F., Cal., assignor of one-half to Thomas E. Johnson of San Jose, Cal. No. 437,879. Dated Oct. 7, 1890. This ruler is designed for use in schools, and is constructed to conveniently contain such necessary adjuncts as pens, pencils, a sponge, a pincushion, a slate rag, etc. The ruler is a hollow cylindrical one, preferably formed of a piece of sheet metal, one of the edges of which is extended to form a concavo-convex portion, the edge of which serves to rule by; the ruler is provided with a concentrically turning compartment or casing fitted within it and having an open front, which is exposed when turned to the front and closed when turned to the back. This casing is to contain the pens, pencils, etc. In the open ends of the ruler are fitted sleeves which carry the sponge, the pincushion and the slate rag.

HARNESS TOOL.—Henry Eghers, S. F. No. 437,888. Dated Oct. 7, 1890. This tool belongs to the general class of combination tools, but is especially adapted for use in connection with the handling of leather and articles and apparatus made therefrom. It will he found useful in repairing harness, belting, and in riveting and lace-cutting. The instrument combines a series of different sized punches, which are carried in the hack of one of the jaws, and each can be readily taken out and placed in position to operate; a rivet-cutter between the two jaws, a strip cutter with guard and gauge on the body of the tool, an awl formed by the sharpened end of one handle, an anvil carried in the end of the other handle, and a hammer formed on the hack of one of the jaws.

HAT-FASTENER.—Philo N. Tryon, S. F. No. 437,878. Dated Oct. 7, 1890. This is a fastener or securing ladies' hats upon their heads. It consists of a plate having a spring hinge clasping a securing pin whereby the plate is secured to the hat, said plate having perforations through which two pronged pins fit and has a sliding movement to penetrate the hair. The device is located heneath the rim of the hat, out of the way.

PIPE MACHINE,—Francis M. Speed, S. F. No. 437,871. Dated Oct. 7, 1890. This machine is applicable to the manufacture of pipe from material which is first made plastic by heat, aud which afterward solidifies. Its principle is the displacement of the material within a mold, by a moving plunger. It consists of a closed cylinder having a pressure head, a plunger within the cylinder, and means for moving the plunger whereby the material within the cylinder will he displaced upwardly about the plunger and will he compressed by the pressure head.

HOSE-COUPLING.—Andrew T. Gilhert, Salem, Oregon. No. 437,890. Dated Oct. 7, 1890. The object of this device is to provide a simple and effective coupling which will admit of its ready connection to join two pieces of hose, or to connect the hose with the hydrant. It consists of two opposing pipes having heads, one of which fits into the other, engaging lugs on one side of the heads, and a swinging link and hook with which it engages on the other side of the heads, said link being carried by and tightened hy an eccentric headed lever pivoted to one of the pipe heads.

GRAIN-CLEANER ATTACHMENT.—John Grider, La Grange, Cal. No. 437,891. Dated Oct. 7, 1890. This attachment is adapted lor use on any grain-cleaner or separator; but it is especially applicable to traveling harvesters. It consists of laterally moving rakes suspended above the cleaning shoe, and mechanism for operating them, so as to throw the chaff and straw toward the center of the shoe and prevent its filling up and accumulating upon the sides. Thus a perfect cleaning is effected, hy the distribution of the material evenly over the surface of the shoe.

Successful Patent Solicitors.

As Dewey & Co have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, le evidanced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNAGIA BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is **the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Allegheny Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

TATUM & BOWEN,

Sole Agents for the Pacific Coast,

Dealers in Improved Wood-Working Machinery

Saw Mill Machinery, Engines, Boilers, Iron-Working Machinery, Supplies, Etc.,

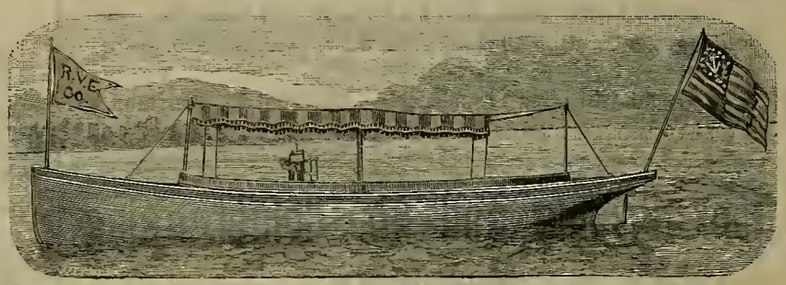
GEORGE HAAS, 824 Market St., Phelan Building, SAN FRANCISCO, Feb. 21, 1890.

REGAN VAPOR ENGINE CO.—Gentlemen: The ½ H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do s my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.

Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steam boats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room;** the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway,** and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

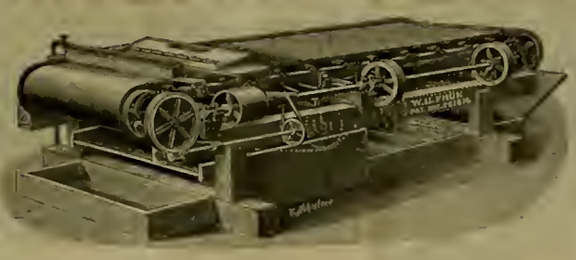
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

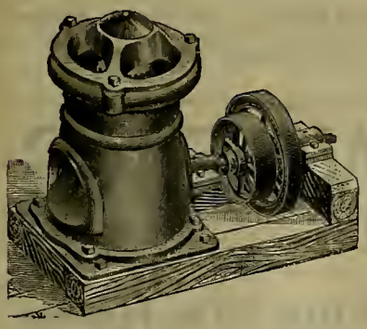
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, Jr.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

GATES ORE AND ROCK BREAKER



UPWARD OF 2000 NOW IN OPERATION.

Guaranteed to do More Than Twice the Work of Any Other with the Same Cost in Wear.

The Gates Crusher having come so largely into use in all the Pacific Coast States, as well as in other mining regions, ample opportunity has been afforded for comparison, with the result that it has an admitted superiority for all such service. Wherever used in connection with the reduction of ores, the advantages have been so apparent, and the results so extraordinary, as to justify the belief that it will soon become a necessary part of every mill equipment, even to the discarding of all other styles of crushers now in use.

The most important feature of this Crusher is its capacity for fine work, it being possible with any size machine to bring the product down to cubes that will pass a ⅝" or ½" ring. By this means, the output of a mill is increased from 25 to 30% without additional cost.

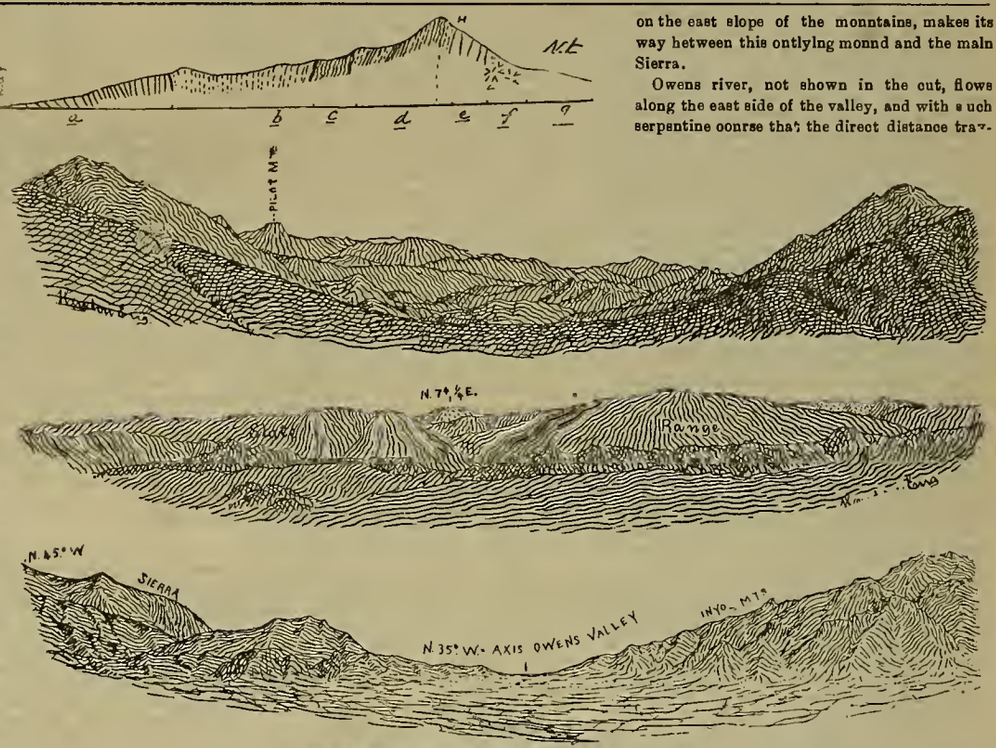
Mountain and Valley Views East of the Sierra.

We complete in this issue the series of articles with accompanying cuts, illustrative of scenes in the "High Sierra," which for several weeks past has been running in the columns of the PRESS. Before dismissing this subject it may be proper to remark that no adequate conception can be gained as to the character of the canyons that furrow the eastern slope of the great snowy range from the cuts we have produced. Their number and general direction are shown, but nothing of either their depth, their narrowness, or their steepness. To depict these, the reader must draw on his reason, or what is better, perhaps, on his imagination. So close together at their entrance, and so impending are the sides of these canyons that the sunlight, except for a few hours in the middle of the day, is entirely shut out from them. A line dropped from its upper edge will, in many cases, strike the floor of the canyon outside the base of the cliff, so far does the face of its wall depart from the vertical. The bottoms of many of these gorges are depressed below the crests of their separating ridges fully 3000 feet. Drifting into these depressions, the snow lies here most of the year, and not infrequently the whole year round. In the early summer, when the snow melts rapidly, the water rushing down them in great torrents carries along the cobbles and bowlders and heaps them up in immense moraines that extend far out into the valley below.

This slope of the Sierra is the region of the Kearsarge, which phenomenon occurs here with greater frequency and power than anywhere else. Attracted by the great height of the mountains, the clouds, surcharged with moisture, gather about the heads of these canyons, and "bursting," fill them to a depth of a hundred feet or more in a very few minutes. Were there here anything of value standing in its way, this rush of water might do much harm; as it is, however, it spends on to the valley, and spreading out there spends its force in a harmless way.

The timber growth along this face of the Sierra commences at a height of about 1000 feet above the valley, and extends thence to an altitude of about 10,000 feet, when it begins to dwarf, and a little higher up ceases altogether. From this source nearly the entire country for 500 miles east must ultimately derive its lumber, and in part also its fuel supply, unless deposits of mineral coal shall meantime be discovered there. As soon as the demand for these articles shall become stringent, railroads will be extended from the mountains into that region, thus rendering their transportation to points of consumption comparatively cheap.

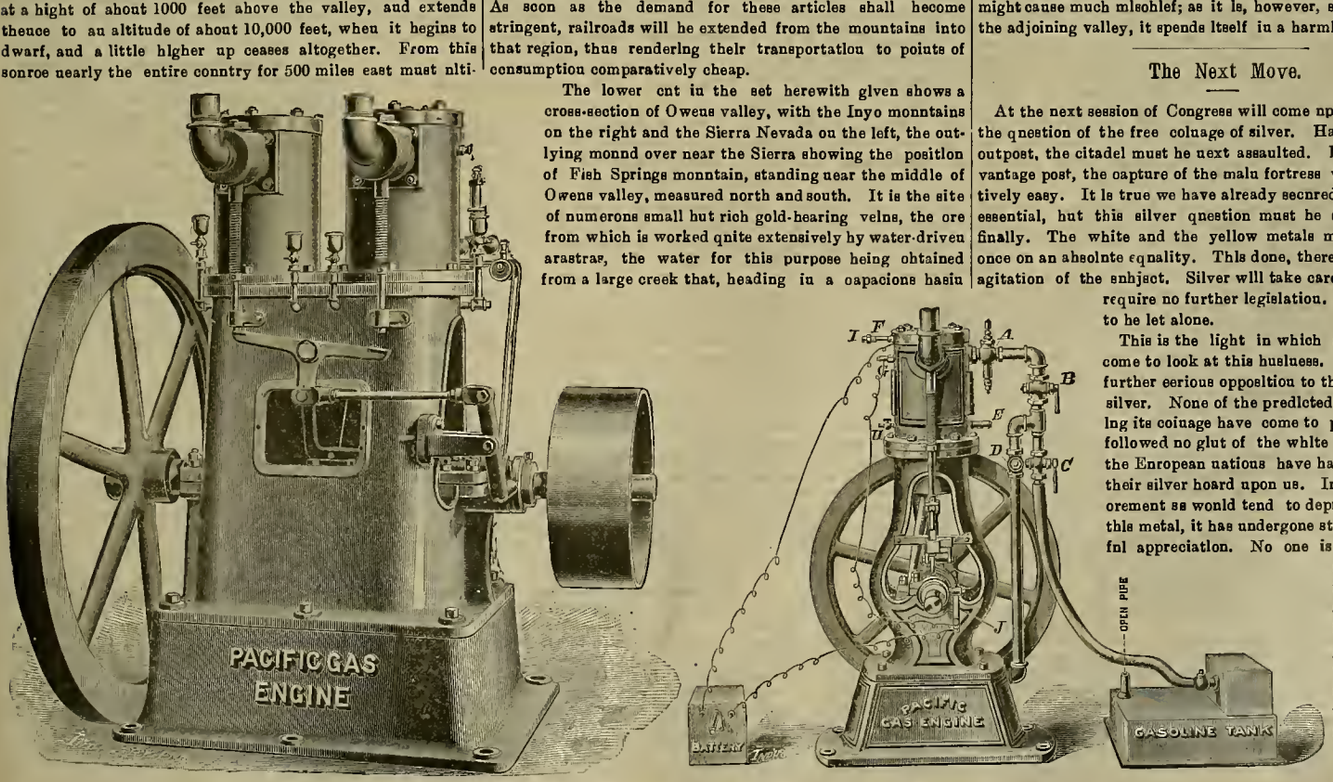


CROSS SECTION OF THE SIERRA NEVADA.

The lower cut in the set herewith given shows a cross-section of Owens valley, with the Inyo mountains on the right and the Sierra Nevada on the left, the outlying mound over near the Sierra showing the position of Fish Springs mountain, standing near the middle of Owens valley, measured north and south. It is the site of numerous small but rich gold-bearing veins, the ore from which is worked quite extensively by water-driven arastras, the water for this purpose being obtained from a large creek that, heading in a capacious basin on the east slope of the mountains, makes its way between this outlying mound and the main Sierra.

Owens river, not shown in the cut, flows along the east side of the valley, and with such serpentine course that the direct distance tra-

eled by it is more than doubled by its sinuosities. Were there here anything of value standing in its way, this rush of water might cause much mischief; as it is, however, spreading out over the adjoining valley, it spends itself in a harmless way.



SINGLE AND DOUBLE GAS OR GASOLINE ENGINES OF THE PACIFIC GAS ENGINE COMPANY.—See page 278.

The Next Move.

At the next session of Congress will come up for consideration the question of the free coinage of silver. Having gained the outpost, the citadel must be next assaulted. Holding now such vantage post, the capture of the main fortress will be comparatively easy. It is true we have already secured nearly all that is essential, but this silver question must be settled now and finally. The white and the yellow metals must be placed at once on an absolute equality. This done, there need be no more agitation of the subject. Silver will take care of itself; it will require no further legislation. It will only ask to be let alone.

This is the light in which all parties have come to look at this business. There will be no further serious opposition to the free coinage of silver. None of the predicted evils of enlarging its coinage have come to pass. There has followed no glut of the white metal. None of the European nations have hastened to dump their silver hoard upon us. Instead of such increment as would tend to depress the price of this metal, it has undergone steady and healthful appreciation. No one is complaining of nor any longer fighting the new silver law. Having done such good preliminary work, it only remains for us now to go one step farther and effect by law the full and final rehabilitation of silver.

[COPYRIGHT, 1890, by DEWEY & Co.]

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XVI.

[Written for the PRESS by JAMES H. CROSSMAN.]

Highland Mountain District.

There occurs in this district an extensive gold-bearing lode traceable by workings and croppings in an easterly and westerly direction for a long distance. On this lode have been located three claims, known as the Gold Drop, the Side Winder and the Keyhole. Running near and parallel with this is another lode, the ore from which assays at the rate of $48 per ton.

The whole mountain slope northerly from the main vein seems mineralized for a distance of 300 feet, ore assaying in gold an average of $5 per ton. The vein in the main lode varies from 6 inches to 5½ feet in width, and will average 20 inches. The average assays of the ore on the 100-foot level of the Side Winder return $34 per ton. On this mine the principal development work has been done. Four shafts have been put down here. The main working shaft, No. 1, situated near the center of the claim, is 112½ feet deep, with sump 8 feet deep. No. 2, situated 448 feet farther west, has been sunk to a depth of 100 feet. At a point 232 feet westerly from this an adit has crosscut the formation for 30 feet to the vein, from which a level has been driven easterly 992 feet, intersecting shafts 1 and 2. This adit carries ore the whole distance, proving the ore chimney to be at least that long. From this adit a winze has been sunk between Nos. 1 and 2 to a depth of 50 feet, the bottom of which is in ore that assays $51.50 per ton. Between Nos. 1 and 2 the ground has been stoped to a hight of 10 feet; this, together with the ore extracted from the second shaft, yielded 750 tons. Two hundred and fifty feet westerly from the intersection of the adit level with the main vein, shaft No. 4 has been sunk to a depth of 55 feet, an adit having been commenced at a point 140 feet below the level referred to, which will afford 240 feet backs. A new 10-stamp mill, with all modern improvements, has been erected on the bank of the Mojave river, 13 miles distant from the mines, to which contracts have been made to haul ore for $2.50 per ton; back freight $1.50. This mine has been recently purchased by a gentleman from Colorado, who, being well acquainted with working this peculiar class of ore, is confident that he can work it up to 80 per cent of its assay value. Timber for mine purposes can be delivered at three cents per running foot.

This district contains within its boundaries 972 square miles, it being the largest in San Bernardino county. This extensive area is subdivided into "camps," which form centers of surrounding groups of mines known as follows: Victor, Highland Mountain, Oro Grande, North Central and West Camp.

Victor Camp

Is situated at an elevation of 2713 feet above the level of the sea, and being a railroad station it forms the receiving and distributing point for a large area of mining territory lying easterly from the Mojave river, as well as for several important mineral localities surrounding this district. The St. Johns and Shearer granite quarries previously described are in the immediate vicinity of the town, adding to its prosperity. The Harrison, containing the ores of zinc and lead in the form of a sulphide, lies northerly 4½ miles, inclosed in a belt of limestone. Adjoining, and near the line of contact of the granite, a shaft has been sunk to a depth of 18 feet. The ores, by assay, show 17 per cent lead, 35 per cent zinc and 27½ ounces silver per ton. Thence 10 miles easterly we reach the base of Highland mountain, which forms one of a series or cluster of isolated peaks composed of granite and feldspathic rocks traversed by dykes of trap, much stained and discolored by the oxides of iron, manganese and other metals, showing a high state of metamorphism. Bodies of calcite also occur, both magnesian and carboniferous. In these formations well-defined veins of quartz occur carrying the ores of gold, silver, lead and copper. On the northerly flank of the mountain, 12 miles easterly from Victor, at an elevation of 3800 feet, we find a gold-bearing vein known as the Side Winder. Its strike is easterly and westerly, inclosed in walls of decomposed porphyry and a soft talcose slate overlaid and underlaid by syenite. The vein is from 18 inches to 4 feet in width, stained and discolored by the oxides of iron and manganese, rendering the gold produced somewhat difficult to save by the free-milling process. Assay of ore yields from $20 to $50 per ton. A 10-stamp mill was erected at a point opposite the mine, on the Mojave river, for reducing the ores, but the results proving unsatisfactory and the process in use not adapted to the ores, the stamps were hung up and the mill is now idle.

A shaft has been sunk here to a depth of 150 feet with lateral drifts on the vein for 200 feet. The vein is traceable on its line of strike for a distance of 2000 feet. The easterly extension is known as the Gold Drop, with a 20-foot shaft with the same character of ore on the westerly extension called the Keyhole. Two shafts, respectively 26 and 10 feet in depth, show the same character of ores with about the same per ton value. There seems to be no good reason why the ores of these mines should not yield good returns with a proper system of concentration. About one mile distant on the southerly flank of the mountain a body of calcite occurs on which a quarry has been opened for the purpose of extracting its marble, which is reported to be of a superior quality. Contracts are being let for hauling the stone to Victor for railroad transportation to a market. Easterly, one-half a mile, we reach

The Greenback.

Elevation, 3725 feet, course N. 20 E; formation, lime shale and syenite gangue, calcspar vein four feet in width; ores, carbonates of copper and silver; thence southerly two miles,

The Imperial

Is reached. Strike of vein, N. 20 W.; dip, southwesterly 18°; gangue, quartz; lode, 7 to 10 feet in width; pay chute, 150 feet long; vein traceable 1000 feet, incasing walls talcose slate and syenite, carrying clay selvages, vein heavily mineralized with iron oxides, gold values (work) $9 per ton; but little development. The Homestake and Little Gold mine in the vicinity are both promising veins.

The Blue Jay

Is situated nine miles east of the Mojave river in the same range; formation syenite, with a lime cap, heavy croppings and copper stain; shaft 10 feet deep, crescent 40 feet, exposing 15 feet ore vein much wider; ores, carbonate of copper carrying from 30 to 40 oz. silver per ton. Shipment to San Francisco gave a net result of $47 per ton. Thence easterly we reach a parallel range, no name, granitic axes with a belt of limestone on the westerly flank at and near the intersection of the two; formation, a well-defined vein carrying the ores of lead and silver, the former a sulphide galena, the latter a chloride; assay returns show 47 per cent lead and 22 oz. silver per ton. This is known as the Lead mine, development unimportant. These isolated ranges contain perennial springs of good water of sufficient flow for domestic purposes, but not in quantity for steam or reduction work. Oro Grande Camp, elevation 2625 feet, is situated on the bank of the Mojave river, is a station on the California Southern railway of the Santa Fe system. This camp also forms a trade center for an extensive mineral area. The mountain from which the camp or town derives its name is a storehouse of mineral wealth, containing well-defined veins carrying the ores of gold, silver, copper and lead. They are, however, of a refractory character and either require chemical treatment or a smelting plant whereby the precious metals can be extracted by the assistance of a lead flux. Attempts have been made and a 10-stamp mill erected at Oro Grande for the purpose of treating the ores by the wet way, but without beneficial results. Oro Grande reduction works, erected at Oro Grande, could be run by water taken from the Mojave river. A ditch has been dug from a point 2½ miles distant, capacity, 1700 miners' inches, affording at its outlet a pressure head of 32½ feet.

Lime.

Several quarries have been opened in the vicinity of the camp, from which a superior quality of lime is manufactured. Four kilns for burning have been erected and two double kilns are in constant operation. Wyman's quarry, 250 feet long by 100 feet wide by 60 high, is a steady producer. There is a ready demand for the lime at the kilns at $1.50 per barrel. Ascending the mountain, which lies east of the town, at an elevation of 3750 feet, we reach the Oro Grande mine, strike N. 30 E., formation porphyry on hanging and trap on foot-wall, gangue quartz friable, and in place saccharoidal, well mineralized; strength 8 to 9 feet, ores silver and copper. At main shaft a large spur falls in from the west, causing an expansion of the ore body. Two shafts, inclining 65 degrees, have been sunk on footwall of lode; No. 1, 100 feet deep; No. 2 50 feet.

Blue Jacket, elevation 3300 feet, gangue calcareous quartz, strike N. E. and S. W.; formation dolomite, strength of vein eight feet; shaft 10 feet deep, ores silver, copper and iron.

Eagle mine, 18-foot shaft, 4 feet wide; no walls on either side of shaft, vein much larger, croppings 10 feet. Assays of ore show 30 ounces silver and 17 per cent lead.

Oro Fino, elevation 3700 feet, strike E. and W.; formation feldspathic granite; dip 65 degrees S.; gangue quartz; strength from 6 to 20 inches, shows by horn-spoon tests $20 per ton.

Carbonate mine, formation blue limestone, stratified; gangue calcareous quartz, strength in croppings 2 feet at bottom of mine; vein 4 feet; assay value of ores at a point near the surface and assay returns show 40 per cent lead 57 ounces silver per ton; at the bottom of the mine, 140 ounces silver and 45 per cent lead, the latter principally carbonate, on which, at the writer's visit, a shaft had been sunk to a depth of 80 feet.

(To be Continued.)

THE San Francisco Bridge Company has been awarded contracts for the building of three bridges on the Canadian branch of the Great Northern over the Skagit, Stillaguamish and Snohomish rivers. The contracts are conditioned for the completion of the bridges by December 1st. They are to be truss structures, and the total cost will be nearly $150,000. The Snohomish bridge will be 1700 feet, the Stillagnamish 400 feet and the Skagit 600 feet long.

The Building of Cities.

A very interesting indication of the relative progress of different cities throughout the country is furnished by the totals of the building statistics. The totals of structures erected in 1889, with their cost in 15 of the leading cities, with some allowance for local conditions, are a very good measure for the growth and enterprise of the different communities.

In this showing Philadelphia maintains the lead, having put up 11,965 houses, while New York comes next with 6722. But in considering the cost of the buildings, New York is far ahead, having put $75,912,816 into new buildings, while Philadelphia's total of cost is but $26,000,000, and is exceeded by Boston as well as New York. These are the two cities whose new structures exceeded 5000. Following these are six cities where between 4000 and 5000 houses were built, and six more whose totals are between 2000 and 4000, in the following order:

	No. Houses.	Cost.	Average.
Chicago	4,931	$25,065,500	$5,083
Brooklyn	4,500	25,619,405	5 706
Boston	4,431	32,400,000	7,312
Minneapolis	4,355	8,737,281	2,006
Washington	4,048	6,165,715	1,523
Cleveland	4,007	4,401,854	1 098
St. Paul	3,756	7,939,403	2,113
St Louis	3 544	9,765,700	2.755
Pittsburg	3,241	8 000,000	2,468
Denver	2,741	10 807,377	3,942
Omaha	2,498	4,663,735	1,803
Cincinnati	2,104	4,143,214	1,969

In giving this comparison its proper value, it should be remembered that there are other things shown in it than the number of new buildings built. The total of cost shows the aggregate investment more clearly than the number of buildings, while the average cost of each building gives a better idea of the standard of architecture in each city than either of the other two. New York, while second in the number, is far ahead both in the total investment and in the average cost of buildings, which was $11,293. Philadelphia, while first in number and second in total cost, has an average for each building of but $2172, which gives it the eighth place on the list in that respect. Pittsburg has to take the eleventh place for number of houses, rises to the ninth for total investment, and its average cost of $2468 gives it the eighth place. While Cleveland is credited with 4007 houses against Pittsburg's 3241, her low average cost of $1098 brings the total investment down to $4,401 854, or a little more than half of Pittsburg's.—*Pittsburg Dispatch.*

IRON ORE OUTPUT AND FREIGHT.—The steady increase over last season in ore shipments is a surprise to both ore-shippers and vessel-owners, says the Cleveland (Ohio) *Marine Review*. Notwithstanding the delay at all ports, there is reason to believe that the total output of the Lake Superior mines will reach 9,000,000 tons, as the shipments up to the present time are in round numbers 6,000,000 tons, or about 900,000 tons in excess of the shipments at the corresponding time in 1889. It is a surprise to most ore-dealers that the movement should be so large in the face of disadvantages, but the ore is all sold, and a market might be found for more of it if it were to be had. The capacity of the mines has been reached, however, and enough vessels have been found to care for the output at moderate rates of freight. This active movement, with some demand for grain tonnage at Duluth, has helped the ore freight market, and there is a noticeable increase in the inquiry for boats at $1 from Ashland and Marquette, and 85 cents from Escanaba.

A COTTON PICKER.—Mr. A. Campbell of Chicago is the inventor of a cotton-picking machine which it is claimed will save 90 per cent of the present cost of picking. A company with a capital of $5,000,000 has been formed to manufacture it, and a factory to cost at least $50,000, and to employ 1000 men is contemplated. Each machine, it is estimated, will cost from $300 to $500, and it is claimed will do the work of 20 men. It consists of a two-wheeled cart, with a box receptacle to catch the picked cotton, and is drawn by mules. The motion of the cart sets in operation a system of fingers or pickers with mechanical appliances that do the work.

IT is stated that another great trunk line is to be built from New York to Chicago. It is to be known as the American Midland railroad, and is to begin at the terminus of the Central Railroad of New Jersey in Jersey City. It will run across New Jersey and traverse the anthracite coal region of Pennsylvania, and will then pass through the bituminous coal and oil sections of the Keystone State. It will cross and exchange business with 60 roads now in operation. The route selected is 120 miles shorter than the Pennsylvania and 200 miles shorter than the New York Central, and it will be the shortest between New York and Chicago.

PHILADELPHIA TO NEW YORK IN 36 MINUTES. Prof. Wm. D. Marks, engineer of the Edison Electric Light Company of Philadelphia, an electrical expert, says he is willing to stake his reputation as an electrical engineer on his ability to construct an electric motor that could take a train of cars from Philadelphia to New York in 36 minutes. One hundred and fifty miles an hour is the speed Prof. Marks' motor would have to make.—*Electrical Engineer.*

The Sequoia Forests of the Sierra Nevada—Their Location and Area.

[A paper read by FRANK J. WALKER at the California Academy of Sciences, Sept. 1, 1890.]

In the Standard Guide-Book to the Pacific Coast, of a late issue, we read this statement: "There are nine groves of big trees in California;" and in the descriptive sketch following this remarkable statement, we find three of the nine groves mentioned as lying south of King's river, vaguely described as: The King's River grove, the grove in the basin of North Tule, and the grove in the basin of South Tule. There are in the localities named, as containing three, no less than seven distinct groves and forests of big trees, while in the enumeration given there is no mention whatever by the author of the several groves and forests of Middle Tule, Kern or Kaweah rivers, nor of the most southern grove, on Deer creek; in short, the omissions comprise some 20 distinct Sequoia groves and forests, aggregating an area of at least 25,000 acres. Few, indeed, of the inhabitants of Tulare county, where most of the forests are found, have any conception of the wide extent of their Sequoia possessions; probably not one person in 500 knows of the existence even of big trees on the Kern-river slope, and many would dispute the fact—a fact I have never seen referred to in print—and yet there are no less than 2000 acres in that region, and some of it the most dense forest growth of *Sequoia gigantea* known to man. And so with other groves; many of them are to the general public practically unknown and unexplored.

The accompanying map is the first ever published with an approximate showing of the area, location or existence even of what is by far the larger part of our Sequoia possessions.

With reference to this map, it is my purpose in this paper to briefly mention what may be termed the forests of Sequoia, and the neighboring groves; and in making the distinction between forests and groves, it will be necessary to draw a somewhat arbitrary line; and for this purpose we will classify as forests all areas of 1000 acres or upward, and all below that as groves. According to this distinction, we can safely assume that all forests of *Sequoia gigantea* are to be found to the south of King's river, and nearly all of them in Tulare county; and with mere mention of the better known northern groves—the Calaveras, South Park, Tuolumne, Merced, Mariposa, Fresno and Washington—we will, therefore, confine our sketch to a description of this region only.

The first, going southward, and probably the largest compact body of all, is located on the south slope of the South Fork of King's river, in Fresno county. It is designated on your map as Converse Basin Forest. Its location may be given more exactly as in the northeastern portion of Township 13 South, Range 27 East, and the northwestern part of Township 13 South, Range 28 East, M. D. M., the larger part being in the latter township. [Please bear in mind that all townships and ranges hereafter given are south and east of Mount Diablo Meridian.] The area of this tract is about 5000 acres. These figures can at best be but an approximation. For most part, the Sequoia country is so broken, and the variation of density of growth so great, and the limits so vaguely defined, that an exact estimation is almost impossible; besides, it is likely to be misleading from the fact that it represents in some instances what might be called a heavy continuous growth, while in others it is more or less broken and scattering. In nearly all cases there is found mixed with the Sequoia a plentiful growth of other timber, principally yellow and sugar pine (*Pinus ponderosa* and *Pinus Lambertiana*), with a sprinkling here and there of fir, cedar and other growths. However, I have aimed everywhere to keep my estimates of areas well within bounds. This first forest, together with the one next in order, are owned by one of the leading lumber firms of California, and, next Wednesday, they celebrate at Sanger the completion of their 40-mile lumber flume, connecting their capacious mills in the mountains with the railroad on the plains. They propose to clean up everything as they go along, stripping the land bare and moving their mills and extending their flume from point to point as the timber supply becomes exhausted. It will probably take years for them to reach the Boulder Creek forest, in Township 13, Range 29, so named from the affluent of King's river, on whose slopes it is found. The area of this forest and neighboring groves cannot be less than 1500 acres, probably more. These two already mentioned lie altogether on the waters of King's river, in Fresno county, but the forest next to the south, the Fresno Big Tree forest, is on the divide between the waters of King's and Kaweah rivers, partly in Fresno and partly in Tulare counties. It lies in the contiguous corners of the four Townships 13 and 14, Ranges 27 and 28. Its original area cannot be computed at less than 2000 or 3000 acres, but so much of it has been stripped of its timber that its limits are hard to determine. Here have been the principal milling operations in Sequoia for the past 20 years. Four sections of it, containing what is known as the "Fresno Big Trees," have already been reserved by the United States Government, it being the only reservation ever made in these southern forests for the purpose of saving the Sequoia. This is the reservation recently confirmed by the Hon. Secretary of the Interior, and containing the famous big tree

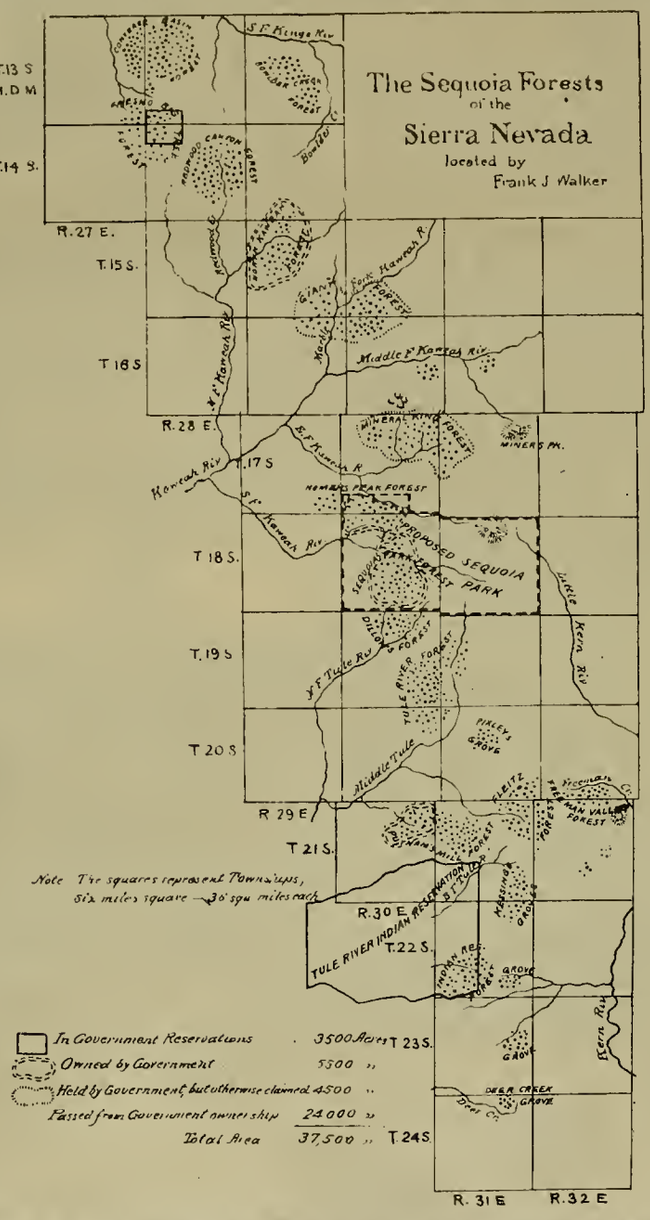
known as "General Grant," said to be 40 feet in diameter.

Passing on to the west side of Township 14, Range 28, we find along Redwood creek a forest of some 3000 acres. This most magnificent growth has also passed from the possession of the Government to private ownership. Farther south, we next come to a forest on the North Fork of the Kaweah river in the northwest portion of 15-29, and extending northward across the line into 14-29. There are here upward of 1500 acres of Big Tree forest still owned by the Government. The whole township is timbered and well worth preserving, aside from the Sequoia.

A few miles southward brings us to the Sequoia tract, known as the Giant forest, located in the contiguous corners of Townships 15 and 16, Ranges 29 and 30, where there is found an area of some 2300 acres of Sequoia. This, although still in the hands of the Government, is claimed by individual locators, by reason of their locations having been made in good faith and filed previous to the withdrawal from entry of these townships, as explained hereafter. It is generally thought that they will substantiate their claims and acquire the land, and public sentiment seems to favor it. Passing to the Middle Fork of Kaweah river, we find several groves, some of which are still in the hands of the Government, but there exists on this branch no Sequoia tract that could properly be called a forest.

Southward, on the East Fork of the Kaweah river, we come to what is designated as the Mineral King forest, from a mining district of that name, comprising, with the detached groves, some 3000 acres; the main body is in Township 17, Range 30, the township whose recent restoration to entry gave rise to the movement culminating in what is known as the Vandever Sequoia Park bill, lately passed in the lower house of Congress. In December, 1885, Commissioner Sparks of the General Land Office withdrew from entry 18 certain townships, of which this was one. The reason for this suspension was the alleged fraudulent character of the surveys. We need not consider the condition of these surveys, but from the character of the country it would seem that the sub-division lines of Township 17, Range 30, could be more readily run with a ruling pen than with chain and transit, and at that time the compensation for either system of survey was supposed to be the same. But one thing is certain, on many of the Government plats you will search in vain for any trace of Sequoia growth, even where the alleged lines run through sections now known to be heavily timbered with the mountain redwood. It is to this fact largely, no doubt, that the very existence of certain Sequoia forests has so long remained unknown to the public.

The fact that several of the suspended townships contained big trees had nothing whatever to do, so far as we know, with influencing the act of the Commissioner. But Commissioner Sparks "builded better than he knew," and the intimate outcome of his order of withdrawal has been to preserve, in the Government's undisputed possession, several forests of these big trees that would otherwise have gone the way of all the rest—into the hands of speculators and lumbermen. Thus the matter remained in *statu quo* till the opening of the present year, the friends of Sequoia preservation resting easy in the fancied security of their position, inasmuch as the Department had expressly declared its policy not to restore to entry these lands in advance of an official examination. At the opening of the present year, parties interested in acquiring timber, by some means, secured the release of the suspension of Township 17, Range 30. It was restored to entry on May 23d, and in less than six weeks the entire Mineral King forest was filed on by timber-land claimants, and the tract effectually cleaned up. While thus the greed for big-tree timber was developing, the supply was growing short and the attention of timber prospectors was turned to other forests; and it was found that in the township to the south, Township 18, Range 30, there was a forest practically unexplored that offered the best field for their next work. The same measures that had proved so successful in opening up Township 17, Range 30, were forthwith set to work to secure this more valuable prize. At this juncture a few citizens of Tulare county took steps to thwart the attempted spoliation of the Sequoia forests. As the forest in Township 18, Range 30, was the one the timber men most wanted, the inference was reasonable that it was the best of all for the Government to keep. We need not detail the ways and means adopted, but the ultimate outcome of the opposition has been the Vandever bill, embracing in its proposed reservation two townships and four sections to be set apart as a National Sequoia Park. This reservation includes the forest marked on your map as the Sequoia Park forest, and also the larger part of the Homer Peak forest, somewhere from 3000 to 5000 acres. South of these, following the Sequoia belt, in Township 19, Range 30, we come to the Dillon Mill forest, of over 1000 acres, with but little remaining to the Government, and from which thousands of Sequoia fence-posts are being hauled this season. And still farther southward, partly in the southeast corner of the same township and extending into the corners of three other townships, is the Tule River forest. Much "cutting and slashing" for a period of years, of which Prof. Eisen told you at a late meeting, has here been going on, and during this time different mills have been drawing their supply of mountain redwood from this forest, and still by far the larger part remains. Here exists a noted center of Sequoia growth known as the "McFadyen 80" (acres), estimated by lumbermen to have on it timber sufficient for 8,000,000 feet of lumber. Only one mill is running this season. This, with the Pixley grove, we will estimate at 3500 acres. About six miles directly south is the Putnam Mill forest, in Townships 20 and 21, Range 31, containing some 4000 acres. A portion of this, that in Township 20, Range 31, is still owned by the Government and is a very beautiful forest of over 1000 acres. In the northeast of this same Township 21, Range 31, and extending into the adjoining townships, is found the Fleitz forest, owned by a Michigan syndicate, while in the southeast portion of the same township, and extending into Township 22, Range 31, are groves owned by the syndicate known as the "Kessing," the several tracts



comprising an area of some 4000 acres. Here again, in the southwest of Township 22, Range 31, the Government possesses a forest of somewhat uncertain value and extent, known as the Indian Reservation forest, and estimated at 1500 acres. It is not generally known that there exists any Sequoia on the Kern river slope, but there are on that side at least 1500 or 2000 acres in groves scattered along the slope from Freeman's valley southward for some 15 miles. Only one of these tracts could be classed as a forest—that of Freeman's valley. Here is a tract of about 1000 acres, a limited portion of which is probably the heaviest growth of *Sequoia gigantea* in the world. Unfortunately this also has passed into the hands of lumbermen. One grove more remains to be mentioned, not because of its intrinsic merit, but because of its location, it being, so far as known, the southernmost limit of Sequoia. It is that on Deer creek, indicated on older maps as "Mammoth Grove." It contains less than 150 Sequoias, scattered over an area of perhaps 300 acres.

This completes the list. The Sequoia forests proper therefore extend over a belt of country beginning at Converse basin on the north and ending with the Indian Reservation forest, 60 miles to the south. The groves and forests together in this region are upward of 20 in number, with an average distance between them of perhaps three or four miles.

Within this scope of country, a moderate estimate of the Sequoia area would be, according to the foregoing figures and including a few unnamed groves, 37,500 acres, divided between the several river systems as follows:

King's river	7,500
Kaweah river	14,000
Tule river	11,000
Kern river	1,700
Deer creek	300
Total acres	37,500

It has been sufficiently shown that there are in the State several forests and groves of big trees still belonging to the Government, aside from those embraced in the Vandever bill. To insure the safety of these, and to put them beyond the designs of timber-men, and above all, to protect them from devastating forest fires, it is exceedingly desirable that they be reserved and placed under expert supervision. We need no reminder that the greed of timber and cattle men will soon work havoc with what remains, unless something be done to stay the devastation; and if we would save a portion we must begin at once.

Concerning the utility of the region embraced in these limits as the best natural reservoir for the storage of waters needed for irrigation, we need not dwell. But for a moment let me touch on the suitability of the country for a park because of its charming natural attractions. You need hardly be reminded of this. The heart of the Sierra culminating in Mount Whitney affords grand scenery of peculiar charm and great variety. Here are three Yosemites rivaling their noted prototype in many features, with a little world of wonders clustering around the headwaters of Kern, Kaweah and King's rivers. We will simply mention the Grand Canyon of the Kern, where for twenty miles the mad waters of the river are walled in with the continuous battlements of the California Alps, crowned with nameless and unnumbered domes and towers. Then, only a few miles across the divide, extends the canyon of King's river with its wealth of impressive scenery; and some eight miles farther to the north lies the Valley of Tehipitee—the gem of the Sierra—with its wondrous dome of rock rising in rounded majesty some 6000 feet from the level of the river-cleft meadow at its feet. Yet a view of the most impressive and characteristic scenery of the region is to be earned by scaling one of the lofty peaks of the Kaweah Range. At least a hundred peaks here rise to altitudes exceeding 10,000 feet. One never can forget the impression, who has once looked out over the California Alps from the pinnacle of Miner's Peak. As I once before said, in describing this scene: "Here amid the companionship of peaks one beholds with speechless wonder the spectacle beyond. No satisfactory view of the Whitney Range can be found from the San Joaquin plains. The intervening Kaweah Range veils the view of the higher peaks beyond. But here, standing on the crest of the Kaweah Sierra, one looks across the Grand Canyon of the Kern, and the encircling wilderness of crags and peaks is beyond the power of pen to describe. Mounts Monache, Whitney, Williamson, Tyndall, Kaweah and a hundred nameless peaks—the crown of our country—have pierced the mantle of green that clothes the canyons below and are piled into the very sky, jagged and bald, and bleak and hoary—a wilderness of eternal desolation."—*Zoe for September.*

PIG IRON IN THE FAR NORTHWEST.—The Portland *Oregonian* says that the production of pig iron, according to the census reports, is yet in its infancy in the Pacific Northwest, but a fair increase has been shown over the report of 1880. In that year the far Western States produced 3200 tons, and in 1890, 26,147 tons. This was, of course, for the fiscal year ending June 30. Of this, Oregon produced all in 1880, and 8411 tons in 1890, and Washington 4787 tons. This is all charcoal pig iron. The Far West, according to these figures, has not made very rapid strides in this particular industry, but this is accounted for on the ground that the people are engaged in pursuits that bring in greater returns. The investigations do not enter into the consideration of the existence of iron ore in either of these States, nor in any of the States for that matter, being confined to the actual production from the furnaces.

THE PIKE'S PEAK RAILWAY (Abt system) is progressing rapidly to completion in spite of some annoying delays. The first trial trip with a passenger car was made Aug. 14th; on the next day the road was opened to the public as far as the Half Way House, with two trains daily; but these were stopped, Sept. 1st, for lack of sufficient patronage, and because it impeded somewhat the work at the front. The cars are nearly all glass from window-sill to roof, with very narrow pilasters between windows. The track is now well above the timber line, within about 1000 feet of the summit.—*Eng. News.*

THERE are now two American-built locomotives running on the Tokio-Kioto railroad in Japan in competition with two similar English locomotives, all doing the same amount of work on a mountain grade of 132 feet per mile for ten miles of the distance. The American machines are of the Baldwin make; the English from the shops of Nasmyth, Wilson & Co. They are running in competition to prove their respective merits. The result of the trial will determine whether England or the United States can make the better engine.

RECENT INFORMATION says that a commission of inquiry investigating the trans-Saharan railway schemes has approved the route from Constantine and Biskara in Algeria across the desert to Lake Tchad. This route is by way of Tiemsen and Amesoltah and traverses the Tuarick country. The length is 2000 miles. This project is backed by the Banque de Russe et Francaise.

PITTSBURG, PA., is about to experiment with a double-deck street car. The car is longer, though not so wide as the car now in use, has 14 windows on each side, and will seat 42 persons on the inside of the car. On the roof there are two seats placed back to back, which extend the length of the car, furnishing a seating capacity nearly equal to that inside the car.

SHIP-BUILDING ON THE LAKES.—The ship-building industry on the American lakes is active, and Cleveland claims to lead the way. Since Jan. 1st the vessels built number 78 steamers, the gross tonnage being 63,922, and 18 barges and sailing ships of 15,315 tons. Last year the vessels built on the Great Lakes measured 107,080 tons.

THE value of merchandise exported from the United States during the 12 months ended Aug. 31, 1890, was $856,321,350. For the 12 months of 1889 the figures were $762,457,824. The value of the imports for the 12 months ended Aug. 31, 1890, was $791,220,608, and for 1889, $764,210,184.

AN English visitor to the St. Louis market recently was so struck with the superiority of American-made horseshoes that he ordered an entire carload for shipment to London. This is the first direct shipment of horseshoes from St. Louis to England.

A NEW IDEA in street rail is about to be adopted on the Broadway, New York, surface road, having a groove for the wheel flange to run in, but not wide enough to admit those of other vehicles.

THE Interstate Commerce Commission estimates that there are in this country 704,743 employes in the actual operation of the railways, or 459 to each 100 miles of road.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amedor.

From Sutter Creek.—*Ledger*, Oct. 18: Mining still continues to look up in this section. Improvements are fast drawing to completion at the Wildman. The frame of the mill is finished with the exception of the east side, which is left open to facilitate the getting in of mortar blocks and other heavy timbers which are nearly all ready to be placed in position. After the machinery is all in the building will be closed up and the stamps will be ready to drop. The ore-bin in another week will be finished, and the rock-crusher will be moved back directly in front of where the bucket dumps. The ore goes through the crusher into the bin and is then by means of a spout run into the car and taken to the mill, the idea of which is to distribute the coarse and fine rock evenly through the mill. Drifting in the Rose mine still continues, but nothing of value discovered yet. There remains 50 or 60 feet yet before they expect to encounter anything of a paying character. The sensation of the week here is the arrival of D. K. Valentine, bringing with him Sam Smitherum, as he states for the purpose of starting operations at the Mahoney mine. R. Redpath, the blacksmith, was put on. Mr. Smitherum was looking for half a dozen miners. They intended at least to repair about 75 feet of the shaft the first thing. The blacksmith put in one shift, when a telegram was received to withdraw and report progress. Mr. Smitherum recommends sinking a new shaft south. The proposition is now resting peacefully in the hands of the company and the peaceful rest of the mine will continue indefinitely.

Kennedy.—The new chlorination works have been run steadily for over two weeks. They were built at a cost to the company of only $3000, the contractor agreeing to work sulphurets for $10 per ton, and work them up to 90 per cent of their assay value. At this rate it is calculated that it will take only nine or ten months to reimburse the company for the cost of the works. The mine continues to look well. The south ore body is 30 feet wide, and yields about $7 per ton. The body running north is smaller, but of higher grade, yielding $12 per ton. Sinking in the north shaft has been delayed considerably on account of the volume of water met with.

Miscellaneous.—The Volcano Gold Gravel Mining Co. are repairing their flume its entire length, replacing everything except the bottom, putting in new blocks and sides. At the Amador gold mine everything is at a standstill. Nothing has been done in the way of satisfying the attachments. The Plymouth Consolidated mill has been shut down. All the hands have been discharged except six or eight miners for prospecting operations.

El Doredo.

Chili Bar Slate Quarry.—*Republican*, Oct. 20: As the demand for the slate here keeps in advance of the product, it will be necessary for the company to increase its labor force, which will no doubt be done, as work, with the preparations made for housing and protecting the men, can be carried on to advantage during the winter. As many men as can conveniently work are employed on the Mothersole quarry. At present a large amount of dead-work is being done. While some slate is being taken out, it will be a few weeks yet before the quarry is in a position to furnish as much slate as it did during the fore part of the summer. The river is now quite low, yet there is water enough to supply all the power which the slate quarries need to prosecute their work. The Big Sandy mine near Kelsey has shut down for awhile.

Inyo.

Modoc District.—*Index*, Oct. 15: This district is again looming up. Fitzgerald is pushing things in his mines, and J. J. Gunn will resume operations in the St. John mine this week. Eight or ten good miners are wanted by Mr. Gunn.

Beveridge.—Ben Lasky is in from Beveridge. He reports the prospects at Keynot as being very good. Considerable ore is on the dump, which will be crushed next month, when the mill will start.

Sylvania.—Inyo *Register*, Oct. 20: Work is being pushed along in the Liberal and Climax mines as fast as possible. A night shift has been put in the shaft being sunk on the ledge of the Climax. The tunnel of this mine is in about 350 feet and is expected shortly to reach the ledge. The Liberal shaft is down about 125 feet and gives promise of soon opening a body of rich ore. It is the intention to sink the Liberal shaft to the depth of 250 or 300 feet and run prospect drifts each way on the ledge.

Sorting the Slag.—J. Woods and M. Gearing have for some time been working on the dump of the old Log Spring furnace, five miles from Bishop, sorting the slag, with the intention of having it smelted again in the Sylvania furnace, but owing to the suspension of work thereon, they have quit work for the present.

Kern.

Beds of Gypsum.—Bakersfield *Californian*, Oct. 15: Would it not be profitable to develop the immense beds or deposits of gypsum lying from 6 to 10 miles east of this city? They are quite near the railroad and the material could easily be shipped. Burned, it becomes plaster of Paris, of which immense quantities have been used here within the past six months in the internal plastering and finishing of houses. Besides, it is applied to an infinite number of uses in the arts, such as obtaining copies of statuary figures, coins, medals, sculpture, carvings, for taking casts of natural objects, and for making stucco work, used in the interior ornamentation of fine apartments. It is employed as the material for molds for electro deposits and for the manufacture of embossed and pressed pottery ware. Ground, it is called plaster, and is one of the most valuable manures known, and has been found especially useful in soils surcharged with alkali. We know of no gypsum deposits in the State so convenient for transportation, and there is abundance of excellent fuel near. There ought to be great profit in working them and we hope they may attract the attention of persons competent to turn them to profit.

Mariposa.

Rich Ore.—*Gazette*, Oct. 18: The Hayseed mine, on Whitlock's, owned by J. B. Helm & Son, is turning out some exceedingly rich rock, from a ledge wide enough to make milling it very profitable. A gentleman who visited the mine in the early part of the week informed us that he saw a large handkerchief full of specimens, all very rich with gold, which Mr. Helm had taken from the ledge, with plenty of gold-showing rock in sight. Joe Schanz is also having some very good quartz crushed at the Ellingham mill. We hope all the miners and prospectors of that locality may meet with the luck they merit for having staid by Whitlock's and Sherlock's so faithfully. There is untold wealth over there, and perseverance is going to get there some of these fine days.

Nevede.

On the Washington Ridge. — *Transcript*, Oct. 19: Joseph Floyd and Alex. McCambridge are meeting with much encouragement at their claim a mile and a half from the Centennial. The tunnel at the Centennial is described as one of the best in the county. It is 800 feet long and as straight as an arrow. From the face of this tunnel the man dumping the car 900 feet away can be plainly seen. Capt. Richards, the superintendent, is pursuing his work intelligently and energetically, and will doubtless soon have a valuable mine for the stockholders.

The New Reduction Works.—*Tidings*, Oct. 20: W. C. D. Body & Bro., who have the contract for the erection of the Grass Valley reduction works, commenced grading for the foundation on Monday. The large scales have been put in place and are in good working order. The large building which is to be used as an office, laboratory, etc., is completed and is a credit to the builder and the company. It is the largest and best office in this county.

The Manhattan.—Grass Valley *Union*, Oct. 20: After several months constant work, the Manhattan mine on Gold Flat, which is under the superintendence of M. L. Elliot, has been pumped out to the bottom, a depth of 300 feet. The ledge in the bottom drift and in the stopes above is found strong, having a width of four feet, showing well in sulphurets, and which prospects in free gold. The fissure which carries the vein is very wide, being 20 feet between walls, and the hanging is regular and so smooth that it looks as if polished. From the 180-foot level, as far as it was extended, to the surface, the quartz has been stoped out, but below that to the 300-foot level, a considerable amount is standing in the stopes and can be easily extracted. Now that the mine has been pumped out there is no trouble in handling the water with the temporary machinery that has been put up, as the surface ground has been quite well drained of its surplus, although the large fissure furnishes considerable water. In the lower level of the mine, when it was pumped out, were found a lot of tools, which were left there 19 years ago, when the works on the mine were destroyed by fire. There were picks, shovels, drills, hammers, sledges, left by the miners as they "went off shift." With the exception of the shovels the remainder of the tools can be again utilized. The appearances are favorable for the Manhattan developing into an important mine.

Various Mines.—*Tidings*, Oct. 17: Supt. Edwin Tilley of the Peahody mine will soon commence to haul between 100 and 200 tons of rock to the Nevada county mill at this city to be crushed. The Central Mining Co., whose drift mine lies back of the Central House, have their tunnel in 575 feet, but will run it 60 feet farther before making an upraise to tap the channel. The Constitution mine, owned by Maltman & Myers, situated near Deer creek, three miles above town, is looking well. A crosscut was run from what was supposed to be the main ledge 20 feet to the north, where a ledge between two and three feet wide was struck which prospects big. Drifting on it is going on, and rock will begin to come out soon. There are three sets of men at work on the Nevada City mine. Hartman & Co. are putting a horse whim on the ledge in Wood's ravine. Jerry Black & Co. are working below the shaft, and Charles Beedle & Co. are at work on the new shaft. The miners say the rock is first class and they feel very hopeful.

North Banner.—Supt. Wheeler has the dead-work done at the Manzanita, which will soon enable him to largely increase his force. The new hoisting and pumping gear recently put in at the North Banner mine is now working in first-class shape. The mining and milling operations which have been stopped for some time are now running in their usual manner. It is expected that the machinery now in place will work the mine to a depth of 1000 feet.

Found a Quartz Vein.—Grass Valley *Union*, Oct. 16: Yesterday morning, while men were engaged in grading off a site for a wood-house at the new extraction works, they cut into a quartz vein, which was 14 inches between the walls, and contained fine-looking sulphurets and prospected well in free gold. This ledge will do to prospect, but the company has too much other work on hand at present to pay any attention to its exploitation.

Struck a Ledge.—Nevada *Herald*, Oct. 15: Francis Burns, superintendent of the big tunnel enterprise starting from the Yuba river and proposed to be run through to Grass Valley, informs us that his workmen have struck a ledge formation supposed to be three feet wide. The rock prospects well, and free gold can be seen in it. He is informed by those who have worked the Oro Fino mine that it is the same ledge. Mr. Burns expects to tap ledges right along as the tunnel proceeds. There are chances for good mines being discovered there, as the tunnel will cross a belt of country known to contain good-bearing ledges.

Placer.

New Quartz Mill.—*Republican*, Oct. 20: It is reported that the Valley View Mining Co. will soon commence the erection of a new Huntington mill on their property near old Whisky Diggings, which will have a capacity of 20 tons a day. Their lead is very strong and the ore is easily mined, and a fair milling test has yielded between $6 and $7 a ton. It is thought by those who have had opportunities for knowing that this will prove a good property. A. O. Bell of Bald Hill is still pushing forward his prospecting in the Mary Bell mine. Pike is confident that the days of the "beefbone copper" will come again.

San Bernardino.

Ten Miles of Pipe.—*Times*, Oct. 18: The Bear Valley and Alessandro Development Co. has contracted with J. D. Hecker & Co. of Los Angeles for the furnishing and laying of 10 miles of water-pipe from a point where the Mill creek zanja diverts the waters from Mill creek therefrom, a little north of east of Redlands, and running thence in a southerly direction to the wagon-road that runs from San Mateo through the San Jacinto canyon; thence along the said road to a point where the same intersects the north line of sec. 35, tp. 2 south, range 3 west, S. B. base and meridian, and being a distance of 53,000 feet. The pipe is to be wrought steel, and the total contract price is over $150,000.

Shasta.

Stopped to Repair. — *Free Press*, Oct. 20: Work in the Iron Mountain mill has been shut down for a few days, owing to the breaking of a part of the machinery.

Sierra.

Nugget Found.—*Mountain Messenger*, Oct. 20: R. P. Mott of Forest City reports that a nugget weighing 66¼ ounces and valued at about $1238—figured in the rough by Chas. Heintzen—the largest found near that town for many years, was recently picked up in a breast at the Golden Hope drift mine, owned by Mr. Mott and E. Cadman & Bros. This claim adjoins the Mammoth Springs a quarter of a mile below the new extension tunnel, another of the many proofs of the apparently inexhaustible richness of this noted Pliocene ridge that has within the past quarter of a century added millions of dollars to the treasury of the world.

New Mill.—A gentleman named Bigelow of North San Juan, Nevada county, is putting up a four-stamp mill on the Johnson ledge about 1½ miles from American hill, using one of the batteries of the Gen. Grant mill. The mill is to be run by water and will be in working order by the 15th of this month. The ledge is from three to four feet wide and prospects well.

Trinity.

Know Nothing Creek Mines.—*Journal*, Oct. 18: Detlef Hansen returned Tuesday from Know Nothing Creek, where he is interested in mines, and reports everything running favorably in that camp. In the Gold Run mine, Hansen, Junkans, H. and A. Dannenbrink have run a 300-foot tunnel which will give them 110 feet stope. The same company is crushing ore from the Hunter ledge in their four-stamp mill. They are now stoping out the Hunter ledge and when they have finished stoping, before running another level, will run the Gold Run rock through the mill. The Know Nothing mine, owned by Hansen, Bennett & Riley, started up last Monday. They have about 150 tons of ore out and this will keep the mill running till winter. Hansen & Dannenbrink are running a tunnel on the Hansen mine to tap the ledge in the bottom of the shaft at a depth of 70 feet. Mr. Hansen says that the summer's work has been satisfactory in the camp and that everything is looking well. New River is rather quiet this fall, but it is expected that business will improve as soon as the Ridgeway tunnel and shaft are connected by the upraise.

NEVADA.

Washoe District.

On the Comstock Lode.—*Territorial Enterprise*, Oct. 22: There are no extra hands at work in any of the mines. The same force that has been steadily employed since the breaking up of last winter, with but few exceptions, is now delving in the depths. The work performed in the Comstock mines from one end to the other is regulated by the ability of the mining companies to bear the expenses. There never was a more economical administration of our mining work than now, and there was never a more vigorous search for ore. There are no men at work this year for political purposes, but they are there for mining-work. The following comprises a portion of the mining operations along the lode during the past week. The reopening of the 1700 level of Con. Cal. & Va. has inspired the stock-trading public with the hope that a development of ore will be made on this level, and the north-end stocks have been strengthened by the work. The hope entertained is not groundless. There is pay ore west of the old bonanza stopes, and it may prove more extensive and even richer than the ore worked from the 1600 level, when the stock went up as high as $65 a share, and from which a long series of dividends has been paid.

Alta.—Worked 315 tons ore; average battery assay, $17.50 a ton. Upraising above 725 level from the northwest drift. Top of upraise in $12 ore and seems to improve as progress is made.

Yellow Jacket.—Shipping 78 tons of $19 ore daily to the Brunswick mill, and doing extensive prospecting work throughout the mine.

Overman.—Shipped to the Brunswick mill 130 tons $16 ore. Stopes yielding about as usual.

Confidence. — General repairs throughout the mine preparatory to prospecting for ore are still going on.

Crown Point.—No change of importance to report of either the east or west stopes. The west stope shows a little more ground in place, but the main supply comes from the old fillings. Shipped to the Mexican mill during the week 414 tons of ore; average battery assay, $14.98.

Con. Imperial.—The south drift from top of the raise on the 450 level is now in 270 feet, having been advanced 25 feet during the week, the face being in quartz of no value. Work on various other crosscuts and levels being pushed as usual with nothing of special importance to report.

Seg. Belcher.—The joint 1100 level east crosscut is out 113 feet; face in porphyry and quartz. The 850 west crosscut is out 224 feet.

Belcher.—The 200 north drift from the west crosscut is out 257 feet in a mixture of porphyry, clay and quartz. The face of the south drift from the 300 west crosscut is in low-grade quartz and porphyry. Have started a raise from the 1000 level to find the continuation north of the 1000 level stope body. Are up 22 feet in quartz assaying from $8 to $15 per ton. The 1100 joint crosscut is out 113 feet. The face is in porphyry and low-grade quartz. The 1300 north drift from the east crosscut is out 131 feet and has struck the old 1300 stope. There is some fair-grade ore in places at that point. The 1400 south drift is out 206 feet. The face is all quartz, giving low assays. In extending the 300 stope south on the twentieth floor a heavy clay was encountered, which has the appearance of cutting of the pay in that direction. Shipped to the Vivian mill 333 tons of ore, average battery assay $21.71 per ton.

Justice.—No change in stopes noticeable. Shipped 182 tons of ore; battery assays, $28.01.

Kentuck.—The 1000 level east drift extended 9 feet; total length, 117 feet; face in porphyry mixed with quartz. West drift on the same level, length, 105 feet; face in favorable looking vein material composed of porphyry, clay and quarz. Are opening out in the 950 south drift and finding some spots of fair-grade ore.

Savage.—We are extracting ore from the 500, 600, 750 and 1300 levels. During the week we have hoisted from these levels 842 cars of ore; shipped to the Rock Point mill 382 tons, and to the Mexican mill 403 tons; average battery assays, $21.83 per ton. We have bullion on hand amounting to $18,000. The southeast drift on the 1380 level has been advanced 26 feet. The last 12 feet of this drift is in ore that assays $25 a ton.

Hale & Norcross.—On 800 level northeast drift advanced 20 feet; total, 215 feet; face continues in low-grade ore. On 900 level, northeast drift advanced 25 feet; total, 135 feet; face in porphyry and streaks of quartz; have taken out old pump rod and columns to 1100 level in the north compartment of vertical shaft, and repaired the shaft, to this point. Are retimbering the 1300 level station and constructing new chute above the station for the incline car to dump into. In about two weeks will be able to resume work in the incline below the 1300 level.

Chollar.—Still making repairs on the 250, 450 and 750 levels. The raise from the 850 level, 60 feet south of north line, in the west drift, is up 30 feet in hard porphyry. Extracted and sent to mill 531 tons of ore; average battery assays, $17.87 a ton.

Potosi.—The north drift on the 1030 level is out 159 feet; face in porphyry. Have started an east crosscut from the end of this drift in 9 feet; face in quartz and porphyry giving low assays. The south drift on the 1130 level is in 67 feet; the face in quartz and porphyry giving fair assays. The north drift on the same level is in 70 feet; face in quartz and porphyry mixed. The winze from the 930 level is down 462 feet; no change in character of ground. The south drift from the main incline, 1230 level, is out 523 feet.

Alpha.—East crosscut, 70 feet north of shaft, 600 level, is out 106 feet, face in quartz giving low assays.

Exchequer.—East crosscut, near the south line, 600 level, is out 48 feet; formation, quartz and porphyry. North lateral drift, 600 level, is out 491 feet from the shaft; face in quartz and porphyry. East crosscut, 500 level, 150 feet south of north line, is out 198 feet; face in clay and porphyry.

Silver Hill.—Northeast drift from the winze, 600 level, is advanced 20 feet through hard porphyry; total distance from the winze, 440 feet. Northwest drift, 334 level, is out from shaft 510 feet; face in quartz and porphyry.

Con. New York.—No work except repairing and easing timbers on 650 and 800 levels has been done the past week. The north drift on the 1100 level is now out 230 feet; formation, quartz and porphyry.

Ward Combination Shaft.—East drift from the 1800 station is out 610 feet; face in porphyry and streaks of clay.

Utah.—725 level: East crosscut No. 2 from the main south lateral has been extended 72 feet; total length, 148 feet; formation is hard porphyry or east country rock. Have suspended work in the crosscut and will resume work in the main south lateral drift.

Occidental Con.—The stopes on the 400 and 450 levels are yielding sufficient ore to keep the mill running to its full capacity. Good ore is also being extracted from No. 2 upraise, which is 400 feet south of the main stopes. Have milled 290 tons ore of the average assay value of $22.40 a ton.

Humboldt District.

Eagle Mine.—*Silver State*, Oct. 14: The Eagle mill at Spring valley, owned by the Humboldt M. & M. Co., has started crushing ore from the Eagle mine. Thos. Harper, an experienced miner, has charge of the works. The mine is said to be looking well, especially in the new shaft, and the mill is reducing 30 tons of ore daily.

Hope Mill.—The Hope mill at Sanborn has started up and is doing good work. The mine is steadily improving, and at the greatest depth attained the ore is quite rich. The company has experienced some trouble from scarcity of water at the mill.

ARIZONA.

Mohave County Items.—Mohave *Miner*, Oct. 11: James Cadden after sinking 50 feet on the Kanawha Belle at Chloride has struck a two-foot vein of ore that will carry 7 ounces in gold. The new strike is just at water level, and is the finest showing that has been discovered in the district for some time. The shaft on the Flores is being shoved down as rapidly as three shifts can sink it. There is four feet of ore in the shaft that shows up well in coarse free gold. The Flores is looking far better than ever before.

Rich Gold Ore.—Prescott *Courier*, Oct. 15: Messrs. Frank and Paul Dillon came in recently from their mine near the Hillside, in Eureka district. Their tunnel is 80 feet; ledge, five feet thick; ore assays $200 per ton in gold and silver, mostly gold. A team with five tons is near Prescott. They intend to keep on shipping ore. Col. Bigelow and others have returned to town from a prospect east of Agua Fria creek, with specimens of gold, silver and copper ores; also beautiful pieces of jasper and onyx.

Speculation Group. - Arizona *Enterprise*, Oct. 11: Lemuel Bannister for himself, and Geo. Westinghouse, Jr., of Pittsburg, Pa., have purchased for $75,000 the Speculation group of mines in Pima district, better known as the Olive Camp. The mines are located 18 miles south of Tucson, and experts state that there is $2,000,000 in ore in sight.

The Gunsight Mine.—Lying 60 miles south of Gila Bend, the Gunsight shows 2100 feet of development. A fine three-compartment shaft has been sunk 460 feet vertically. Down this shaft 200 feet a crosscut was run about 50 feet to the vein which was found to be an immense lode 42 feet across, of silver-bearing free-milling ore, worth at least $30 per ton. Probably there is in sight the biggest deposit of precious metal rock in this mine that can be found in the Southwest. Certainly there is nothing like it in Arizona. The ore resources are simply enormous. On the dumps outside are piled 10,000 tons ready for treatment.

Ore and Bullion Importations.—The No-

gales *Herald* gives the importations of ore and bullion from Sonnra, Mexico, for September as follows: Omaha & Grant Smelter, Denver, 454,000 pounds, valued at $59,125. Rio Grande Smelting Wnrks, Socorro, 273,000 pounds, valued at $31,863. Philadelphia Smelting Works, Pueblo, 142,000 pounds, valued at $10,845. El Paso Smelting Works, 152,000 pounds, valued at $22,111. Denver Smelting Works, 34,000 pounds, valued at $1585. Selby Smelting and Reduction Works, San Francisco, 15,000 pounds, valued at $3007. Nogales Sampling Works, 43,500 pounds, valued at $3487. Total, 1,113,500 pounds, valued at $132,023. Silver bullion to the value of $36,927, and gold bullion to the amnunt of $56,320 are the bullion importations; also $27,000 in Mexican silver dollars. The duties collected during the month amounted to $631.05.

BRITISH COLUMBIA.

KOOTENAY ITEMS.—*The Miner*, Oct. 14: The diploma for the best mineral exhibit at the Tornnto Exhibition was awarded to West Kootenay. A crnwn grant has been applied for by the owners of the Pnorman. A plumbago find is reported on the north side of the Kootenay.

DISCOVERIES.—*Inland Sentinel*, Oct. 11: The richest discoveries made this year north of Trail creek and Kootenay lake were made in the Lardeau by J. W. Haskins on Campbell mountain, over the divide eastward from Trout lake. He staked and recorded five claims, some of which run high in silver, 80 per cent lead and over $200 in gold. There are several men who are working at placer mining between North Arm and Trout Lake, among them P. M. Walker, and they are reported to be doing quite well.

COLORADO.

WILL NOT CLOSE DOWN.—Aspen *Times*, Oct. 11: A report was started yesterday to the effect that the Compromise mine was about to close down, but it proves to have been unfounded. The company will not close so long as it can get rid of its ore. There has been much difficulty in securing cars for some time, but there is now a prospect of the famine coming to an end shortly. Mining operations in the Regent are temporarily suspended, pending the completion of some repairs and improvements. Arrangements are being made for running air-drills in the southern part of the property, and this involves the laying of a line of pipe. The Johnson strike proves to be as big as was first reported, and it is bewildering to contemplate the vast wealth of the mine should the recent discovery prove to be a regular ore chute. A number of Aspen parties are interested in a recent strike made at Winfield, in Chaffee county, that is of great promise.

THE LEE MINE.—Reports from the Robert E. Lee mine at Tin Cup are of the most encouraging character. The ore body is from 5 to 10 feet thick, and the grade of mineral is good. The mine has begun regular shipments, and the outlook for the property is exceedingly good.

LAKE COUNTY. — *M. and S. Review*, Oct. 15: The Horseshoe district bas taken a fresh start lately and everything in that locality appears to be booming. On the Peerless Maud property a tremendous amount of development work has been done, and they are now about to ship largely, though they find considerable difficulty in procuring a sufficient number of miners to do their work. The Black Prince crosscut reached the lode last Wednesday and the vein shows a fine streak of solid ore 18 inches wide, besides which there are 10 to 15 feet of gold quartz that will run $15 per ton.

DAKOTA.

BLACK HILLS ITEMS.—Deadwood *Pioneer*, Oct. 15: The Calletta group of mines is a new discovery made only last July. It is situated on the north side of Galena gulch, and comprises six claims. Last week they shipped 726 pounds of ore which netted over $17.50, an average of over $50 a ton.

DOGTOWN.—This is a little village near Hill City, surrounded by tin claims, is prosperous and will soon have a newspaper of its own. The Harney Peak Co. is doing good work on the claims in that neigbborhood.

CUSTER COUNTY.—Titus E. Corkhill, inspector of mines, returned yesterday from an official visit to Custer and Pennington counties. From bim we learn that the Flora, Tin Reef, Old Jeff and Czar tin mines are sinking shafts with the aid of Ingersoll rock drills, and are showing good bodies of ore. There is said to he a man in the Hills who proposes to treat refractory ores free of cost. The process has not been made public—possibly mercurial evaporation. Hill City is the most prosperous little community in the Hills, with brilliant prospects for the future. It is situated exactly in the center of the tin belt, which is about 30 miles long and three miles in breadth.

IDAHO.

BOISE DISTRICT. —Idabo *Statesman*, Oct. 12: The American Mining Co. of Helena, Montana, bave bought out A. Kleinschmidt's interest in the Seven Devils' copper mines for $1,600,000, and capitalized their company at $5,000,000. Contracts are being made for hauling to Weiser ore for shipment to Belleville, Illinois, Smelting Co. Next season a railroad will be built, and the greatest mining camp in America, if not in the whole world, will be started. The strike in the Hillside mine, near Bellevue, is of ore that nets $140 to the ton. On the head of Smitb's gulch Sam Boorn, Green Martin and A. B. Linderman bave struck it rich. Their ledge is not so large as the Sunlight, but the ore from it is just as rich. They have a two-foot vein of ore that will go from $200 to $300 per ton. Last Tuesday morning a small piece of galena was brought down from the famous Morning mine and left at the U. P. depot to be sent to the Spokane Exposition. When placed on the scales it weigbed 405 pounds. Work on the new concentrator at Wardner is progressing quite rapidly, 265 men being employed on this work.

MONTANA.

FROM HELENA.—*Mining Journal*, Oct. 15: The outputs of the St. Lawrence and of the High Ore, Green Mountain and Jim, comprising the active mines of the Chambers Syndicate, aggregate 85 cars a day, which are sent tn the Anaconda smelter. Other mines belnnging to the Anaconda Co. are being put in condition for early prnduction, and the company will shortly bave as many men on its paymll as at any time during its existence. The Granite and Bi-Metallic Co.'s disburse nearly $100,000 per montb to employes in the mines and mills, and it is predicted that the disbursements of other properties of the camp will bring the amount up to $200,000 at no distant day. Evidently Granite is a good camp to tie to. A mineral-bearing lead, 250 feet wide, carrying silver in sulphide form, is said to have been discovered recently 12 miles north of Champion, on a branch of the Cottonwood. The ore assays 12 nunces silver frnm the surface. The Boston & Montana Co. at Butte is about to change from the old method of hand to air drilling.

DRUMLUMMON OUTPUT.—*Montana Mining Review*, Oct. 12: The following is the output of the Drumlummon mine for the month of September. It will be noticed that the mine had this month increased its output, and the report from the property wnuld indicate that the monthly output will steadily increase: 60-stamp mill crushed 3603 tons, yielding $54,800; 10-stamp mill crushed 501 tons, yielding $16,600; 50-stamp mill crushed 2800 tons, yielding $24,100; total, $95,500; working expenses, $54,500. Mr. J. M. Ellis of Clancy recently made a discovery of a rich lode on Clancy creek, about one mile above its junction with Prickly Pear creek. The vein has an average width of 9 to 18 inches and assays nearly $200 per ton, one-fourth of which is gold. It is rumored that rich placer ground has been discovered in the upper Stinking Water country, the nearest point for supplies to the new discovery being Red Lodge. It is understood that two men made a cleanup of $140 in four days' sluicing in these diggings. The officers and leading stnckholders of the Granite Mountain mine held a meeting in St. Louis on the 4th inst., and gave a 90-day option on the property to the American Investment Co. of London at a figure close to $30,000,000. The chances are that the sale of the Granite Mountain will lead to the sale of the Bi-Metallic, which is capitalized at half the number of shares—200,000.

NEW MEXICO.

GRANT COUNTY.—Silver City *Enterprise*, Oct. 10: E. M. Hand of Silver City, a well-known assayer, has investigated the Organ mines in the interest of the railroad scheme. He was much pleased with the camp and his report will doubtless be favorable.

GOOD PROSPECT.—*Southwest Sentinel*, Oct. 14: There is a fine prospect of a mining boom in the vicinity of Albuquerque. A prospect hole on the eastern slope of the mountains, whicb bas been worked more or less during the last six years, has struck ore of a fine quality, and returns just received from a mill-run but recently made in Denver, show that it nets about $300 a ton.

UTAH.

BINGHAM NOTES.—*Stock Exchange Journal*, Oct. 14: The Mary M. Co. was organized yesterday and articles of incorporation will be filed to-day. The property of the company is located in Carr Fork gulch, Bingham, Utah, and is already a producing mine. The company is now taking out ore that assays from $16 to $80 in gold and 8 to 10 ounces in silver to tbe ton. The mine has a brilliant future before it inasmuch as it bas an immense body of the needful—rich ore.

VEINS OF MICA.—D. C. Robbins, wbo has prospected Emery county very carefully, reports the discovery of 13 veins of pure mica hetween Huntington and Price. The veins run from 2½ to 4 feet in width, and have well-defined side walls.

TINTIC.—*Inter-Mountain Mining Review*, Oct. 10: Chas. Saviers will soon begin a vigorous campaign of development on the North Star group near Eureka. The Iron mine near Silver City is again working. The property has so much ore in sight that continuous work of 10 men would glut the market. There is no limit to its production. The Soutb Galena of Bingham is doing as well as it ever has in its history. The concentrator is running at its full capacity, and saving above 90 per cent of the assay value of tbe ore. Judge Dana, one of the owners of the Governor mine in Dragon bollow, Tintic, was in this city several days the past week, jingling about $16,000 in coin of the realm in bis pockets as his share of the proceeds of the sale of tbat property.

TINTIC MINES.—Eureka *Chief*, Oct. 20: Jupiter group is looking splendid. Shaft down about 25 feet. A fine new engine is being set up at tbe Caresa. The ore output from this mine will now be greatly increased. Some black manganese at tbe Governor, considered worthless, was assayed this week and gave 100 oz. silver and a high per cent in copper. The force bas been increased here, a new shaft is being sunk, tbey are making a new road to the mine, and putting up a boarding-house, shops, etc. An engine will soon be put up. The mine is looking better than ever and promises to develop into a regular bonanza. An assay of ore from the Wolf, in the Spy country, gave 46 per cent lead, 17½ oz. silver and $3 in gold. Assay from tbe top. A cave was struck in the General Logan this week and an assay sbowed about six ounces of silver and a trace of gold. Tbe boys are pushing development work and are confident that tbey will soon have shipping ore.

WASHINGTON.

A KING COUNTY MINE.—Seattle *Press*, Oct. 9: Judge J. Luttrell Murpby has just received returns from the ore shipped from the Snoqualmie Pass Gold, Silver and Marble Mining & Milling Co.'s mines, in Snoqualmie Pass, a few days ago, to the Tacoma Smelting & Refining Co. The test is highly satisfactory. Judge Murpby says be thinks that King county can soon enter tbe contest for the banner mining county of the State in precious metals.

WESTERN WASHINGTON.—Mr. George Milliken, the mining and mineral expert of the Northern Pacific railroad, said to a *Press* reporter: "I bave just returned from the Silver Creek mining district up in the Cady Pass. I have spent a deal of my time tbis past summer examining the mining resources of the Kootenai and Okanagon districts in Eastern Washington. True, there are some very valuable and promising mines in each of those localities, but I must admit that Western Washington, particularly the Silver Creek district, far surpasses either of those. I am astonished at the wonderfully rich galena ledges carrying silver."

COAL AND COPPER. — Port Townsend *Ledger*, Oct. 2n: D. M. Young, who with three others bas been out on a prospecting tour for nearly three weeks, returned home last night with some splendid specimens of coal and copper. The specimens he brought were discovered 22 miles from Port Townsend, and at an elevation of 1500 feet above the sea level. The coal was taken from the surface croppings, and is of so fine a quality that it will burn readily. The ledge is six feet thick. Some fine copper croppings were also picked up from a three-foot ledge.

WYOMING.

ORE, OIL, ETC.—Laramie *Republican*, Oct. 13: Two mining syndicates have been organized at Buffalo to send prospectors into the Bald Mountain district. Caspar has another oil well, struck on the 6th inst. Great excitement prevails and land locators are out in all directions. Fremont county's mining boom still continues and prospectors are still flocking toward that regiou. A Douglas syndicate, headed by James Bury, has put in a five-stamp mill at Miners' Delight at a cost of $7500. Emil Granier has spent a big sum in strengthening the dam used in his hydraulic mining operations. He has already invested nearly $1,oon,ooo in the district. The Rose mine, the new strike of the Davis boys, who sold a claim to Senator Tabor, is looking well at 25 feet. They have contracted for a 60-foot shaft and a drift of 50 feet. Several claims that were abandoned 10 to 15 years ago have been reopened, notably the Clipper, whicb discloses a fine ore body.

Mining Share Market.

Mining shares, so far as the Comstocks are concerned, ruled quiet with a strong, healthy tone. On yesterday (Wednesday) the market began to show more activity, resulting in better prices this morning under the leadership of Con. Virginia, Alpha and Best and Belcher. The advance in these stocks is said to be due to the important character of the work going on, and a few brokers seeing a good opportunity of turning an houest (?) penny on a bull movement, owing to the return of Senator Jones to the coast and the arrival ot Col. Mackay in New York. In outside stocks the Bodies made quite an advance, but to-day they are weak and lower. The Quijotoas have been active at a slight advance. The Tuscaroras liave hung around last week's prices.

One of the most favorable signs of the times is the election of W. H. Hobart, the millionaire mining operator, as a director of the Exchequer Mining Co. This move shows that large operators are beginning to come to the front, so as to give personal attention to the workings of the mines. It is only a question of a short time when they will be convinced of many needed reforms in mine management. Mr. Hobart's example should be followed by others.

The Andes Mining Co.'s affairs have been amicably settled. It now turns out that there was a tempest in a teapot, and nothing more. Previous to J. W. Brown securing control of tbe mine, the annual assessments averaged $75,000. Under Mr. Brown's two years' administration, only two assessments of $25,000 each were levied, and more work was done than ever before.

From the Comstock mines our advices report very important work to tbe west in Gould & Curry. In Best & Belcher and Sierra Nevada the work is of an important character. In Alpha and Exchequer the west work ougbt to begin to show good results soon. In Confidence work is under way to tap on the 1000-foot level, the rich strike made some time since on the 800-foot level. In Crown Point very interesting work is under way. Extensive prospecting work is being done in Con. Imperial, Yellow Jacket, Savage, Chollar and Hale & Norcross. In Kentuck the work continues of the most encouraging character. More prospecting work is being done in Andes. In West Con. Virginia work has been resumed. A shaft is being sunk preparatory to deep mining for the purpose of prospecting the very rich development made hy Con. Virginia in its west workings, and also by Ophir on its 700-foot level. Work in all the mines is to the west to tap the Red lode we have persistently advocated.

From outside districts our advices are still of an encouraging character from the Quijotas and Tuscaroras. From the Bodie district our advices report the ore in Bodie in the winze below the 700-foot level going from $50 to $75 a ton. On the 400-foot level the grade is mucb bigher. The work in all parts of the mine is of rather an exciting nature. A remittance has left the mine and is expected to arrive here to-morrow (Friday). It is said to be quite large. Private advices received to-day report a $40 strike in Bulwer.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of snbscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its valne more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a snbscriber, please show the paper to others

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wisb it, but if it le continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THERE is said to be a district on the borders of Death Valley that abounds in gold, silver, lead, copper, antimony, iron, soda, borax and salt.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 14, 1890.

438,223.—WASHING MACHINE—M. K. Biser, Los Angeles, Cal.

438,593.—INSECTICIDE—Giles & Brown, National City, Cal.

438,251.—WIND ENGINE—John Harder, S. F.

438,417.—STICKY FLY PAPER—E. Krull, S. F.

438,482.—CHURN—E. D. Middlekauff, Stockton, Cal.

438,273.—TRICYCLE — A. E. Miller, Sprague, Wash.

438,355.—VERGE WIRE FOR CLOCKS—J. M. Miller, Vacaville, Cal.

438,360.—HARNESS—J. R. Phelps, Sacramento, Cal.

438,177.—PIPE TONGS—J. M. Pray, Los Angeles, Cal.

438,178 — SKIRT-MEASURING APPLIANCE—J. F. Prizgint, Los Angeles, Cal.

438,362.—TIRE TIGHTENER—G. C. Richards, Sissons, Cal.

438,243. — WRENCH — H. Scheatzka, Bothell, Wash.

438,259.—CABLE RAILWAY—J. C. Shelley, Stockton, Cal.

438,449.—THROW-OFF FOR CABLE-GRIP—T. W. C. Spencer, S. F.

438,455.—LAMP-SHADE SUPPORT—O. F. Wegener, Seattle, Wash.

The following brief list by telegraph, for Oct. 21, will appear more complete on receipt of mail advices:

California—John W. Gentry, aeeignor of one-half to J. Jacob, Oakland, railway-cable grip; John Hatch, San Francisco, safety device for elevatore; Enoch Lawson, assignor of one-half to P. Leprohon, San Francisco, pipe coupling; William J. Herson, Stockton, assignor of one-half to C. D. Harson, churn; David D. Jones, aeeignor to W. C. Anderson, San Jose, fruit-dipping apparatus; John Kueffer, San Francieco, assignor by mesne aeeignments to American Indicator and Improvement Company of California, automatic mecbanism for etation indicator in railway cars; Morris Lachman, San Francisco, sewing-maobine; Ernest E. Lommatzsch, San Francisco, toy target; Abraham Morris, San Francisco, child's bed-lounge; Albert S. Morton, Suisun, wine-cooler; Chester W. M. Smith, San Francieco, metallic railway-car; Gottlieb Spicese, San Francieco, razor-strop; John C. H. Statt, San Francisco, aseignor to American Bell Telephone Company, Boston, Mass., telephone.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable ratee, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VERGE-WIRE FOR CLOCKS.—James Munroe Miller, Vacaville, Cal. No. 438,355. Dated Oct. 14, 1890. The object of tbis invention is to provide a means for readily putting the clock in beat whether on a level shelf or not. It consists of a jointed verge-wire, the fulcrum of which is movable, and a lever for shifting this movable fulcrum. When the clock is out of beat, by turning the lever to one side or the other, as may be needed, and therehy shifting the fulcrum of the verge-wire, the sections of said wire are slightly cbanged in position and made to conform to the position and throw of the pendulum wire, while keeping the verge itself in proper position to be operated by the scape-wheel. The end of the lever is within convenient reacb of the operator.

TIRE-TIGHTENER.—Geo. C. Richards, Sissons, Cal., assignor of one-half to Wm. T. Tuckwell, Sissons, Cal. No. 438,362. Dated Oct. 14, 1890. This invention belongs to that class of adjustable spoke sockets in which the spoke is adjustably connected with the felly, said adjustment being controlled and operated hy a nut, the effect of which is to vary the length of the spoke, whereby the tire, the felly, and the spoke are tightened. It consists in a felly having a socket, a spoke having a tenon fitting in the socket, a protecting plate fitting around the spoke-socket and extending up on each side of the felly, a sleeve on the spoke-tenon having a head provided with a concave seat which receives the convex portion at the base of the tenon, a nut upon tbe threaded portion of the sleeve having a flange on its under surface and a split wasber between the nut and the head of the sleeve.

HARNESS.—James R. Phelps, Sacramento, Cal. No. 438,360. Dated Oct. 14, 1890. The purpose of this device is to give a trotting, pacing or running horse a proper gait and cause bim to spread the hind feet when traveling so as not to interfere or overreacb. It consists of a frame-work supported from the back or bips of the animal, and connections from said frame-work to the bind legs of the borse with such an elastic tension as will cause the animal to travel with the bind feet more widely separated than it would otberwise do.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by tending their influence and encouraging favors. We intend to send none but worthy men.

H. KELLEY—Vodoc and Laeeen Cos.
T. B. LESIEUR—Humboldt Co.
GEO. WILSON—Sacramento Co.
J. P. QUINETTE—San Francisco.
J. C. HOAG—San Francisco.
SAMUEL CLIFF—San Luie Obiepo Co.
W. W. THEOBALDS—Loe Angeles Co.
J. H. CROSSMAN—San Bernardino Co.
JOHN B. HILL—El Cajon, Cal.
W. B. FROST—Marin and Sonoma Cos.
GEORGE EVANS—Santa Clara Co.
MRS. M. E. DUDLEY—Ventura Co.
ANDREW REID—Monterey Co.
B. F. BELT—Shasta Co.
FRANE S CHAPIN—Colusa Co.
HENRY STAORY—Oregon.
WM. M. HILLEARY—Oregon.
JOHN SIMPSON—Oregon.
WM. HOLDER—Oregon.
R. G. HUSTON—Montana.

MECHANICAL PROGRESS

Reduction in the Price of Aluminum.

The recent announcement of the Cowles Electric Aluminum Company that they have reduced the price of aluminum to $1 per pound marks an event of unusual interest in the history of this remarkable metal.

But a few years ago this needful metal could not be profitably produced for less than $20 per pound. From that time until some three years since the price was gradually reduced by economies and improvements in its manufacture to $2.50. Improvements have since been still going on until the price is now reduced to $1 per pound.

Quite recently Prof. Joseph M. Hirsh of Chicago, as has already been stated in these columns, announced his readiness and determination to put up aluminum works in Chicago with which he could produce the metal by a new process for less than 25 cents per pound.

This announcement was generally received as a fraud, but since that time it has been stated by the Chicago press that the professor has actually put up works in that city and has manufactured 2000 pounds of aluminum already, and that when the works are fully completed they will have the capacity of turning out one ton of the metal per week. The process is claimed to be entirely new and no infringement on any patent or process hitherto employed.

In a recent interview Prof. Hirsh said: "I have solved the problem of extracting the metal from an aqueous solution, and the process has been so simplified that it is surprisingly cheap and requires but little labor. Pure kaolin or clay contains 53 per cent of aluminum. From the clay which I am using I can get 16 3 5 per cent metal."

The professor also said that the Thompson Patent Car Company has already arranged to construct four sleepers of aluminum for the Baltimore & Ohio Railroad Company.

It is claimed that at 50 cents per pound aluminum would become a formidable competitor with copper. The Cowles Company is one of the largest manufacturers of aluminum in the world, if, indeed, they are not the very largest, and to their success is due the gradual reduction of its cost.

As the metal is of so recent introduction in commercial quantities, and at a price not warranting extended experiment and use, the present field of application is as yet somewhat limited. But this field will rapidly widen with the cheapening of production. At the present price of $1 per pound, aluminum is already a serious competitor with both nickel and tin. Judging from the continual and rapid fall in price in the last five years, the lowest price has not yet been reached.

An alloy of aluminum with tin is something new which has recently been announced. This alloy is formed by fusing together 100 parts of the former with 10 parts of the latter. This alloy is paler than aluminum and has a specific gravity a little heavier than the pure metal, but not too heavy to be formed into parts of instruments intended to be very light. The alloy is not so easily attacked by the several reagents as pure aluminum is, and it can also be worked more readily. Another great advantage of it is that it can be soldered as easily as bronze without further preliminary preparations. There can be no question but that there is a great field opening up for this metal in the near future.

A Machine to Drill Square Holes in Iron.

A machine has recently been invented in England to drill square or hexagonal holes. In fact, two such machines have been patented, one called the Ainley-Oakes drilling machine, which in appearance resembles an ordinary drilling machine. It has, however, a spindle composed of three concentric parts, upon one of which is a set of cams so arranged that each cam, when brought into combination with the part in which it works, produces at the cutter a hole of a given size, each cam producing a different sized hole. In other words, in cutting a square hole, the toe of the cutter describes a square. It is not possible without drawings to make the arrangement clear, but it may be stated generally that the mechanical details, while very ingenious, are very simple, and the results very satisfactory.

The second machine is the Tyler-Ellis drill, which is an outcome of the previous apparatus. In the Tyler-Ellis machine the spindle moves about the center of a ball joint, and by an improved arrangement of the working parts, holes of any conceivable mathematical outline can be drilled. It also cuts clean angles in the square holes, while the Ainley-Oakes drill leaves a slight filling of metal in the angles, which has to be cleared out after the hole has been drilled. It is curious to watch the machine forming a four-sided hole in a plate of metal, but it does it in a very practical and effectual manner.

The value of these machines, says a contemporary, will be found in engineering workshops and shipbuilding yards, where great numbers of square holes are constantly required to be made in various parts of machinery, and would be much more frequently made were the means at hand for forming them. It is stated that the cost of drilling square holes is no greater than that of round ones, although up to the present time the cost has been as 1 to 36, that is, a square hole has hitherto cost 36 times as much as a round one.

A New Mode of Manufacturing Netting.

A new mode of manufacturing netting by slitting and expanding sheet metal has been devised in England. The article produced is quite dissimilar to other manufactures of the kind.

The product is called expanded iron. According to London *Iron*, the process of manufacture consists in the employment of a machine which so operates on a sheet or strip of metal as to slash it at intervals in parallel lines, so as to leave uncut spaces, which serve to maintain the connection between all the strands produced by the act of slashing. The method by which this slashing, as well as the opening up of the sheet or strip into meshes, is performed, is peculiar, and one which makes it possible to transform the sheet or strip of metal into a finished article at one operation, and to this achievement is due the great commercial value of the invention. The simultaneous act of slashing and opening, or expanding the sheet at the slashes, leaving uncut spaces, and giving uniform design and set to the metal forming the meshes, is novel and difficult of explanation, except by witnessing the movements of the machines. Any homogeneous metal, such as steel, copper, brass, etc., can be employed. The machines automatically feed a strip of steel between their cutters, which simultaneously slash and expand the metal into meshes. These strips may be of any width, from one to eight inches or wider, the ratio of expansion being determined by the size of the mesh. Thus a strip of steel seven inches wide by nine feet long, made into ⅝ inch mesh for lathing, gives as a result a sheet of finished product, 18 inches wide and about five per cent shorter than the original strip, whereas a strip of metal six inches wide and nine feet long, made into a four-inch mesh for fencing, gives as a result a finished sheet four feet wide by eight feet long. The cut edges of the strands forming the meshes are presented to the surface in the finished sheet, thus giving rigidity to the expanded sheet many times greater than the original flat sheet or strip.

AN ELECTRIC PROCESS FOR MAKING WROUGHT IRON.—A process of making wrought iron from pig metal without puddling is one of the discoveries made by Dr. Emmens of Greeneburg, near this city. The doctor accomplishes his object with the aid of electricity. He takes a vat which is filled with a chemical solution and a number of thin sheet-iron plates. Then the pig iron is also placed in the vat, after which the pig iron and the sheet iron are connected with a dynamo. The current generated by the dynamo is said to have the effect of causing the pure iron to be separated from the impurities in the pig iron and form a deposit on the sheet-iron plates. The quality of this wrought iron is stated to be superior to that of the best Swedish metal. It can be bent, rolled or twisted into any shape while cold. Dr. Emmens says that he can take a horseshoe nail of this iron, fasten the head in a vise and twist it into an almost perfect screw without breaking. —*N. Y. Electrical Engineer.*

THE POPULARITY OF AMERICAN WIRE WORK SCREENS.—The sudden popularity of American made wire-work screens for offices, churches, household and other purposes, in South America, South Africa, Australia, and in other distant countries, is not surprising, remarks *Engineering and Mining Journal*. It meets all the requirements of hot climates, where the free circulation of air and the admission of light are essential, and it affords also a pleasing effect on the eye. To such an extent has this development of the old wirework gone that hundreds of patents have been granted for processes and mechanisms of manufacture. As it stands to-day, it is practically a new industry built upon the old one of iron wirework. Dozens of factories are occupied in the work, and many artists are vying with each other in evolving new, quaint and beautiful or curious designs, to the oddity of which there is no limit, and in which ingenuity is not sought.

A NOVEL KIND OF STEAM ENGINE is described, which dispenses with piston-rod, crosshead and wave, and is claimed to reduce friction to the lowest possible point. It has an oscillating piston sustained in a journaled bearing, and turns about one-fourth of a revolution to each stroke of the engine, the only friction outside of the shaft to which the rock-cranks are attached being a slight pressure on the packing strips to keep it steam-tight. The operation of the engine is in every respect satisfactory.

IN THE MANUFACTURE OF SHOVEL-HANDLES, it is said that a large proportion, usually about 75 per cent, are split or broken in the process of bending, which loss has led to the invention of a handle-bending machine. The saving effected may be estimated from the fact that in a trial lot of 25 dozen put through the machine only one handle was spoiled.

A MONSTER GUN, 50 feet in length, with an inside diameter of 15 inches, and weighing about 40 tons, has been cast by the West Point foundry for the Pneumatic Gun Company, and having been successfully tested, will soon be shipped to Australia.

SCIENTIFIC PROGRESS.

Electric Research.

"Light is an electric phenomenon in its very essence; the light of the sun, as well as that of a candle or glow-worm. Suppress electricity in the universe, and light disappears; suppress the luminiferous ether, and electric and magnetic forces no longer exert any influence through space."

Such was the thesis of a paper read by Prof. H. Hertz before the recent Medical Congress at Heidelberg. The relation existing between electricity and light was suspected by Faraday, and was by him investigated, without material results, however. Next, Clerk Maxwell presented his "Magnet'e Theory of Light," which fell just short of proving the truth of his theory. Many others have also theorized over this belief without coming to any definite conclusion, though startlingly near its solution.

It was, of course, on the suggestions of his predecessors that Prof. Hertz based the experiments that seem, if not to prove the identity of electricity and light, at least to give logical reasons for his belief in that identity.

If by means of electrical waves we can succeed in producing phenomena similar to those of light, the identity of the two would seem to be proved beyond a doubt.

One of Prof. Hertz's experiments consisted of placing the conductor which produces the variation of the electric condition in the focus of a large concave mirror. The electric waves are collected and issue from the mirror in the form of a rectilineal bundle. We cannot, it is true, either see or touch this bundle, but we know that it exists because we see sparks passing over from it to any conductor it may meet. It becomes perceptible when we arm ourselves with our electric resonator. All these properties are those of a luminous ray.

Starting from the domain of electricity, pure and simple, we have, when we admit the truth of the above experiments, landed squarely in the domain of ethics, and "the identification of light and electricity, suspected by science," says Prof. Hertz, "foreseen by theory, is definitely established; it has become perceptible to our senses, intelligible to our minds." The paper concludes somewhat in this fashion: "We shall see henceforth electricity in a thousand circumstances where we did not suspect it before; each flame, each luminous atom, becomes an electric phenomenon. Even when a body does not give off any light, provided only it radiates heat, it is the source of electric action. The domain of electricity thus pervades all nature—it pervades ourselves; in fact, is not the eye an electric organ?"

On the Cause of Trade-Winds.

Maury's theory on trade-winds was formed at a time when the materials on hand of actual observations were very scanty. His theory was that the trade-winds, after having blown across the earth's surface, are supposed to rise to a higher level, there to pass through each other and then come down again to the surface as anti-trades (having changed their direction in the meantime owing to the earth's rotation), as if it were possible to imagine that the wind could blow at any point in two opposite directions at the same time.

At the beginning of the present year, Frank A. Veleohow, as per his communication in a late issue of *Mechanics*, formed another theory which seems to meet the case in a more convincing manner. His general conclusions are as follows: (1) The surface air becomes dry by resting over the large arid zone lying north and south of the equator and is formed into cushions of dry air which are ultimately thrown westward over the surface of the ocean. (2) By getting cooled down over the sea-surface the dry air appears there as centers of high pressure, which are kept up or fed by the continual flow of dry air from land which circulates round these centers of high pressure. (3) The trade-winds in each of the five oceans are, therefore, each of them one continual current of dry surface air issuing from a dried-up land district lying to the east of them. (4) The direction of the circulation does not depend upon the earth's rotary motion, but upon the interposition of the centers of high pressure and the corresponding dried-up land districts, the former always lying a little farther from the equator than the latter.

As the dry air which causes the whole trade-wind motion is produced over the dry land surface and consumed or saturated by evaporation in the centers of high pressure over the oceans, it will be observed that there is a certain natural sequence in the explanation given, and it enables us to trace the trade-winds from their place of origin to where they ultimately die out.

It goes almost without mentioning that these continual trade-wind currents set the surface of the underlying oceans in a similar gyratory motion, and thus aided, as they are, by the shape of the adjacent coast-lines, become the principal cause of a certain class of ocean currents, more particularly the Gulf Stream.

The earlier observations on which Maury's theory was founded were mostly made by seafaring people who had no opportunity to compare them with the winds over adjacent land surfaces. The more complete observations now attainable, which have been thoroughly studied and largely observed by Mr. Veleohow, which are also free from any serious objectionable points, render his conclusions much more acceptable than those of Lieut. Maury.

ELECTRICAL WONDER WORKING.—One of the chief ends of popular electrical education, says the *Electrical World*, is to eliminate a certain sort of credulity. The popular idea of electricity is to look upon it as some mysterious force, coming from nowhere in particular, doing very nearly what it pleases, and equally able to produce a spark and a general disruption of the universe. There is a tendency on the part of certain people to contemplate it as an African doctor his gree-gree—a wonderful and ineffable something that need only be invoked to produce almost any result that can be named. This spirit has, perhaps, hastened the march of electrical industries, but it is certainly unworthy to encourage it. The sooner people are brought to look upon electrical power as only one of the Protean forms of energy, as subject to known laws, and quite transformable into other kinds of energy, the better for everybody concerned. To be sure we do not know what electricity is; in fact it is quite probable that it is not a separate entity at all; but on the other hand we do not know what the force we call gravitation is. Yet the actions of both under given conditions can be foretold with considerable accuracy, and perhaps we should not be able to do much more with them if Nature should yield up her profound secrets and set the unquenchable curiosity of man at rest. Look at electric energy as a force obedient to certain laws, known and unknown, able to accomplish much in skillful hands, but do not imagine it as ready to do all sorts of marvelous things without any particular method in its madness.

EXPLORING PARTIES.—A bill introduced in the House of Representatives provides that the Secretary of War be authorized to send an expedition to the interior of Alaska for the purpose of making a thorough exploration and survey of that Territory, with a view of ascertaining its resources and capabilities. It is proposed that the party sent out should locate near the center of the Territory, and from that point as a base, push expeditions into all parts of the interior. The party is to remain not less than three years. In this way a thorough knowledge of the topography and other features of the country may be gained. An appropriation of $100,000 is asked. Another exploring party, under charge of Prof. Lumholtz, a Norwegian explorer, famous among geographers by reason of his expeditions in Australia, is about to explore Lower New Mexico and Arizona under the direction of the American Geographical Society of New York. About a dozen scientists, archæologists, botanists and zoologists will accompany him. The special object of the expedition is to examine the remains of ancient civilization, antedating, it is said, that of the Aztecs, and existing principally in the Gila valley, in the northwest part of Arizona. The peculiar habits of the Zuni and Navajo Indians will also be investigated.

WHAT DYNAMITE CAN DO.—Shooting a candle through a two-inch solid plank without disturbing it in the least is being done by dynamite, which is so quick in its action that the tender green leaf can be compressed into the hardest steel before it has time to flatten. One of the experiments of the United States Torpedo Works was to place some leaves between two heavy, flat pieces of iron, set them on a firm foundation and see what gun-cotton would do in forcing the iron pieces together. The reaction was so great from just being exploded in the open air that one of the iron pieces was driven down upon the other quick enough to catch an exact and complete impression of the leaves before they could escape. It is also a singular fact that the gun-cotton itself should sink deep into the iron when it explodes, showing the points of the letters stamped into the cartridges. This novel method of engraving by gunpowder is one of the wonders of the century.

TREES SIX HUNDRED AND FIFTY FEET HIGH. "What do you think of trees 650 feet high?" said Prof. F. O. Plummer to the editor of the Olympia *Tribune*. "They are to be found," continued the professor, "that high in the uncurveyed township near the foot of Mt. Tacoma; and what is more, I have seen them and made an instrumental measurement of a number with that result. There are lots of trees near the base of Mt. Tacoma whose foliage is so far above the ground that it is impossible to tell to what family they belong, except by the bark. Very few people know or dream of the immensity of our forest growth. I wish that some of our large trees could be sent to the World's Fair at Chicago. We could send a flag-pole, for instance, from 300 to 400 feet long."

BLEACHING BY FUMES OF BURNING CHARCOAL. Instead of bleaching by fumes of burning sulphur, as at present practiced by wool-bleachers, Brownen and Gamgee patent the burning of bisulphide of carbon in suitable lamps. Sulphur or brimstone, when burned with sufficient access of air, produces sulphurous acid; the bisulphide of carbon, when completely burned, produces a mixture of sulphurous acid and carbonic acid.

USEFUL INFORMATION.

PAPER BARRELS.—Much study and experiments have been given to the production of a thoroughly practical paper barrel. It is thought that this result has been most successfully reached by an English company whose barrels are now largely used for the carriage of gunpowder, mining fuses, fruit, flowers, molasses, paint, cement, matches, chemicals, dyes, asbestos, sugar, size and extract of meat. The materials used in making the barrels are waste paper, cardboard and (for the better quality) old sacks. When cardboard is used it is soaked or boiled for six hours and afterward treated in the same manner as the other raw material. This is carefully sorted and put into a rag engine or beater, where it is beaten and torn to pieces by a series of knives for about an hour and a half. It is afterward mixed with water until a pulp of uniform consistency is gained. This is rolled, joined, shaped and dried, and the barrel is finally covered with hoops. Before the tops and bottoms are put in, the barrels are painted with a waterproof composition, made of linseed oil and rosin for ordinary-purpose barrels, and with a special varnish where they are used for food products. The standard size made is 16½ inches in diameter by 28 inches long. The price at which these barrels can be produced enables them to compete favorably with wooden barrels; a barrel costing 34 cents in wood can, when made of paper, be sold for 28 cents. One great feature is that there is no waste with the process, all "wasters" being beaten up into pulp again.

CLEANING FILES.—A new method of cleaning files, which is claimed to well-nigh restore them to the condition of new ones, is described as follows: After being cleaned and wetted, the files are dipped between two carbons into acidified water and the circuit of an electric current is established between the carbons and the files by means of a piece of metal serving as a support to the file by which the latter is suspended. The water is then decomposed by the current, the oxygen acting upon the cuttings of the file, while the hydrogen bubbles settle on the teeth and protect them against the action of the acidified water. After immersion for a few moments the file is withdrawn and brushed in clean water to remove the oxide of iron, and then replaced in the bath. When the cuttings are entirely cleared the file should be immersed in an alkaline bath to remove all traces of the acid, then dried and brushed.

WHY DOES A TOP STAND UPRIGHT WHILE SPINNING?—Says a cotemporary: Speaking of the difficulty of explaining some problems, we once heard an engineer say that the hardest problem he had to explain was why a top in spinning stood upright. The popular notion is that it is all due to the centrifugal force of the revolving top keeping it erect, whereas this is not the case. The top holds its position erect because gravity, which tends to pull it over, does not act quickly enough. It takes time for gravity to act, and the center it would work on has passed before it has time to act, and so it continues until the motion of the top comes slow enough for it to act. But how to explain it all in a simple manner was the difficulty.

HOW TO SWEEP A WOODEN FLOOR.—We don't use a leaky old sprinkling-pot to sop the floor all over in puddles when we sweep. No, sir! We have wet sawdust, and I put a row of it across one end of the store and sweep that right along to the other end, just like a regiment marching across a ten-acre lot. It catches all the dirt and carries it along. If it gets a little dry, I add some more. Some folks scatter sawdust all over the floor, but Mr. Vanders says that's no good; that the reason for using sawdust is to avoid wetting the floor all over and to have something that will absorb the dust.—*Cin Enquirer.*

BY COVERING BULLETS WITH VASELINE they may be easily seen in their course from the rifle to the target. Their trajectory course is marked by a beautiful ring of smoke, caused by the vaseline being ignited on leaving the muzzle of the gun, the smoke being suspended for some time in the air, if not too windy.

HOW TO KEEP FLIES FROM PICTURE-FRAMES. Boil three or four onions in a pint of water; then with a gilding-brush go over the frames of your picture and chimney glasses, and rest assured that the flies will not alight on the articles washed with the solution. It will do no injury to the frames.

THE VALUE OF PATENTS.—The United States Government Commissioner of Patents estimates that from six to seven eighths of the entire manufacturing capital of the United States, or $6,000,000,000, is directly or indirectly based on patents for inventions.

A GOOD FURNITURE POLISH.—An excellent furniture polish, for everything but a piano, is made by mixing three parts of alcohol shellac varnish with one part of boiled linseed oil. Shake well and rub briskly while applying.

RAIL ENDS FOR MINE TIMBER.—A patent for employing iron and steel rail ends, defective and new rails as pit and mine props, supporting pit, mine and other shafts, circular and rectangular, for tunnels, bridges, pithead gearing and structural work, has been obtained by Mr. W. Wilson Barnes, mining engineer of Harrington, Eng. The application is simple and easy, and will probably admit of another outlet for waste and other rails.

GOOD HEALTH.

The Health of the State.

The monthly report of the State Board of Health is before us, from which it appears that mortality reports received during the month of September from 85 different localities throughout the State, with an estimated population of 705,309, give the number of decedents as 920, being an annual mortality at the rate of 15 6 per thousand, which is a considerable decrease from the previous month. The mortality from cholera infantum has in a marked measure decreased, as also have diseases of the respiratory organs.

Prevailing Diseases.

Reports of sickness from 98 localities throughout the State continue to indicate a very favorable condition of the public health. It does not appear from any of them that epidemic disease of any description is present anywhere in the State. Bowel disorders are quite prevalent, as might be expected at this season, when fruit is indulged in without regard to quantity, and very often to quality. The cooler weather of the month past has had a beneficial effect in lessening the frequency and fatality of summer diarrhea in children.

In regard to diphtheria and croup, the report says that a serious outbreak occurred in the Protestant Orphan Asylum at Sacramento, in regard to which the report says: "We cannot too earnestly impress upon the authorities that each case of such disease is a public danger, against which the public, as represented by its local sanitary authorities, is entitled to be warned by proper information, and we believe that where an institution like the orphan asylum is the seat of epidemic contagious disease, it is the duty of the local sanitary officer to visit such institution and have it properly disinfected under his personal supervision. Such disinfection should not be intrusted to those ignorant of the precautionary duties required, or left to the chance of a superficial sprinkling of carbolized water about the room as a sufficient remedy to destroy the germs of the disease. We believe that much of the diphtheria that exists is dependent upon insufficient disinfection where a case occurs. The germ we know is most tenacious of life, and except the most skilled disinfection is exercised, will continue to live and propagate its hateful existence for an indefinite period of time. We should therefore require all health officers to see to this matter themselves, and know that through their exertions all ordinary precautions have been taken to insure immunity to the public under their charge."

Typhoid Fever and Milk.

Typhoid fever appears to be increasing in many localities, in regard to which the report says: "Its prevention simply requires perfect cleanliness about persons and premises, and constant watchfulness in regard to the sources of supply for drinking water. All suspected water should be boiled. Numerous instances are recorded when typhoid fever has been spread from the rinsing of milk-cans with water apparently pure but really infected with the germs of typhoid fever capable of infecting the milk. We have no doubt that many of the cases of typhoid fever which have baffled our research for their origin have arisen in this way. Most of our dairies have their water supply from wells sunk in the cow-yard where they receive the drainage from the polluted soil. It is a matter of history that cattle themselves suffer from a disease analogous to typhoid fever if not the identical disease itself. It would, therefore, be an act of prudence on the part of our health officers to visit our dairies and examine the source of their water supply and the means used in keeping the milk from pollution. Milk from an unknown or a suspicious source should be heated to the boiling point before using, as thus is effectually destroyed not only the germs of typhoid fever but likewise the germs of consumption, which are very commonly conveyed through milk taken from tuberculous cows."

THE ART OF BREATHING.—In each respiration an adult inhales one pint of air. A healthy man respires 16 to 20 times a minute, or 20,000 times a day; a child 25 or 35 times a minute. While standing, an adult respiration is 22 times a minute; while lying down, 13. The superficial surface of the lungs, *i. e.*, of their alveolar space, is 200 square yards. The amount of air expired every 24 hours is about 10,000 quarts. The amount of oxygen absorbed in 24 hours is 500 litres (about 744 grams). The amount of carbonic acid expired in the same time is 400 litres (911.5 grams). Two-thirds of the oxygen absorbed in 24 hours is absorbed during the night hours, from 6 P. M. to 9 A. M.; three-fifths of the total is thrown off during the day. The pulmonary surface gives off 150 grams of water daily in the state of vapor. An adult must have at least 360 litres of air in an hour. The heart sends 800 quarts of blood through the lungs every hour, or about 5000 daily. The duration of inspiration is five-twelfths of expiration, seven-twelfths of the whole respiratory act. During sleep, inspiration occupies ten-twelfths of the respiratory period.

ENGINEERING NOTES.

Ocean Steamship Racing.

It is difficult for the general public to understand why the competition for time is kept up so lively between the steamship lines between New York and Liverpool. The margins are so close—sometimes a difference of only a few minutes in a voyage of 3000 miles—that there is a suspicion in regard to the honesty of the time-keeper. Of course the rapid shortening of the time by days and hours within the past few years indicates the rapid strides that are being made in the science of steamship building and steamship navigation as compared with the use of steam on land. Imagine two locomotives with their respective trains making a forced trip between this city and New York (3000 miles) and coming in within 14 minutes of each other!

But there is another view which seems to be taken of this matter by our Government and the steamship companies. According to an authority which ought to be unimpeachable—the manager of one of the European steamship companies—the rivalry among the various lines in making short passages across the Atlantic is really a struggle for precedence in carrying the United States mails. Where rival lines go to the same port, the United States mail is sent by the fastest vessel. This is ascertained by taking the average speed made by a vessel during her last three trips. The logs are sent to the postoffice, and there the average speed is determined. So eager is this rivalry, and so close are the records, that one vessel of the White Star Company may carry the mail one trip and her rival of the Iuman line the next. This has repeatedly happened during the last summer. As averages are computed each trip, the difference of a few minutes means the loss or gain of valuable freight. The safety valve prevents crowding steam beyond the limit fixed by Government inspectors.

Is not this action of our Government encouraging ocean-steamship racing to a dangerous point? Are the lives of the thousands of passengers, who are constantly crossing the ocean in these steamers—an ocean often rendered very dangerous by thick fogs and towering icebergs—of less consequence than the delivery of a lot of mail bags a few minutes sooner than a reasonable safety would admit? This ocean racing, if thus encouraged, may soon become as dangerous as was steamboat racing on our Eastern and Western inland waters before railroads drew off the bulk of rapid transit. The safety valve is supposed to prevent the crowding of steam beyond the limit fixed by Government inspectors—but is the Government inspector always around at the right time?

THE SCIENCE OF NAVAL ARCHITECTURE, so far as ships of war are concerned, appears to have reached a deadlock. Naval constructors have reached the limit of armor which a ship's sides may carry without impairing her seaworthy qualities. Other constructors have cast guns which will pierce that armor and send a shell through it. The limit of caliber for guns to be used on board ships was probably reached in the Italian Duilio and the English Inflexible. Guns of over 110 tons cannot be fired without straining the vessel so as to endanger her sinking. On the other hand, a single shell from a 110-ton gun on shore would convert any man-of-war into a shambles—she would be most effectually *hors de combat.* And, again, the progress of the science of submarine gunnery, as shown in such vessels as the Portuguese torpedo craft and the Vesuvius, renders it reasonably probable that in a short time a small craft not much bigger than a whitehall boat will be able to creep unseen under the counter of the largest ship afloat, pick up all the torpedo nettings, and blow her monstrous antagonist into the air. Under the circumstances, it must be admitted that the construction of navies is rather a disheartening pursuit.

FROM DAMASCUS TO THE SEA.—The Sultan of Turkey has granted to an English company a concession for a railway from the ancient city of Damascus to Acre on the Mediterranean. Several branch lines are also conceded. The main line will be 127 miles long, and will open up to the commerce of the world the most ancient, interesting and one of the most fertile regions on the globe. The harbor of Acre is said to be one of the best on the Syrian Coast. This railroad and the one now in process of construction from Joppa to Jerusalem, one or both of which will, no doubt, soon be continued to the Lower Euphrates valley, and the Indian ocean, will make a close connection between the ancient and modern centers of civilization.

THE CONSTRUCTION OF RAILWAYS in the United States thus far this year, is summed up by the *Railway Age* as being 3782 miles, distributed among 212 lines. Nine Southern States lead in this report with 1443 miles on 65 lines. The total increase of track-laying over that for the same period of last year is 470 miles. The entire new mileage for 1890 is placed at 6100 miles.

THE PANAMA CANAL.—Conflicting rumors are in circulation in regard to what the Colombian Government proposes to do in regard to extending the time for the completion of that work. A few weeks ago it was stated that the time had been just extended for 12 years. Now comes a statement that the Government asks the Panama Canal Company for a very heavy payment for an extension of time on the Colombian canal concession which the company desires, and that it is thought if Colombia persists in the demand, the result will be the final winding-up of the company.

"THE COMING MOTOR."—Will it be driven by steam or electricity—who can tell?

ELECTRICITY.

ELECTRICITY IS NOT MANUFACTURED.—The question that the courts of Pennsylvania have still before them for final settlement—whether or not electric-light corporations are manufacturing companies—is beginning to be a problem also in certain Western cities and provincial towns, where, as in Pennsylvania, manufacturing companies are conditionally exempt from taxation. There is already a number of court decisions holding that electric-light companies do not manufacture anything, for the reason that electricity is not a manufactured product at all, hence they do not manufacture light. This puts the electric companies at a disadvantage in competition with gas companies where the latter are accorded exemption from taxation, and the question will probably be carried to the U. S. Supreme Court for ultimate settlement. In the meantime it is contended that as manufacturing consists of increasing the value of raw material, electric-light companies do not come within the meaning of manufacturing. However, many cities tax electric-light machinery under the manufacturing clause of the tax schedules, and a decision as foreshadowed would exempt in the latter cases.

ELECTRICITY IN FISHING.—It has long been known that light has a strong influence in attracting fishes in deep water. Some very interesting experiments have recently been made in the use of the electric light, which, different from other lights, can be lowered to great depths in the sea. In the course of these experiments, it has been found that the electric light has a large future before it in the fishing business, and particularly in deep-water fishing. At present the cost of miles of line and netting required for a complete fishing plant is very considerable, cumbersome and unwieldy, the latter especially in bad weather. Instead of extensive nets each fishing boat with a small electric-light plant and a few hand-nets would be able to accomplish much more than would be possible with the present cumbersome outfit.

ELECTRICITY AS A BED WARMER.—The latest use for the incandescent lamps, says the *Stationary Engineer*, is one by which it is claimed that the user obtains a large amount of comfort from the lamp during the hours when otherwise it would not be in use. Out in Idaho the ingenious people take the lamps to bed with them on nights when the thermometer is low-spirited. They claim that it serves a better purpose than any of the hot water or heated brick devices commonly used for this purpose, and in sections where meters are not in use for measuring the current, it costs no more to burn the lamp all night than for a few hours only.

THEY ARE OF NO USE.—It is only a few years since a distinguished professor of Johns Hopkins University, in reply to a question from a lady as to the facilities in that institution for the study of the practical uses of electricity, replied: "Thank heaven, madam, they have no use." It is said, however, that no university, *now*, more fully appreciates the value of such studies than the Johns Hopkins; but it must be rather mortifying, in view of the progress of the last 15 years, to think how bitterly that institution opposed such studies at its start.

THE LONGEST TELEPHERAGE LINE IN THE WORLD has just been set up in South America. The overhead electric railway will be 186 miles long, and will connect Buenos Ayres with Montevideo. Its object is to allow of traveling letter-boxes to be dispatched every two hours between the two cities. The line will cross the La Plata estuary in that part where it is 19 miles wide. The two wires there will be supported on either side of the river by two towers nearly 270 feet high.

EXTRACTING TEETH BY ELECTRICITY.—An electrical instrument recently invented for avoiding the pain incident to the extraction of teeth, has attracted considerable attention. Briefly, it consists of adjustable prongs, carrying buttons and connected with an electrical battery. The buttons are placed on the face, over the nerves leading from the teeth to the brain, and a circuit is established the moment the extracting instrument touches the tooth.

ELECTRIC RAILROAD BRAKES.—In England, where particular attention has been given to the subject of electric brakes, it is said that a means has been discovered by which a train going 30 miles an hour can by an electric brake be brought to a standstill in a space of 200 feet.

ELECTRICAL PRODUCTION OF CAUSTIC SODA.—Caustic soda and chloride of lime (bleaching powder) is now produced from salt by means of electricity more readily and cheaper than by the old methods.

TABLE OF CONTENTS.

EDITORIALS.—Mountain and Valley Views East of the Sierra, 265. Passing Events; Utility of the Decoy; Mining Laws vs. Directors' Duties; The Lean Gold Ores of California and Australia; The Next Move, 272. Salt-Making Processes; Pacific Gas or Gasoline Engines; The Regents of the University, 273.

ILLUSTRATIONS.—Cross Section of the Sierra Nevada; Pacific Gas Engine, 265. Plan of Grainer Block Process for Salt-Making, 273.

MISCELLANEOUS.—San Bernardino County; The Building of Cities; The Sequoia Forests of the Sierra Nevada—Their Location and Area; Iron Ore Output and Freight; A Cotton Picker; Philadelphia to New York in 36 Minutes, 266. Pig Iron in the Far Northwest; The Pike's Peak Railway; Ship-Building on the Lakes, 267.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 268-269.

MECHANICAL PROGRESS.—Reduction in the Price of Aluminum; A Machine to Drill Square Holes in Iron; A New Mode of Manufacturing Netting; The Popularity of American Wire Work Screens; A Novel Kind of Steam Engine; The Manufacture of Shovel-Handles; A Monster Gun, 270.

SCIENTIFIC PROGRESS.—Electric Research, On the Cause of Trade-Winds; Electrical Wonder-working; Exploring Parties; What Dynamite Can Do; Trees Six Hundred and Fifty Feet High; Bleaching by Fumes of Burning Charcoal, 270.

USEFUL INFORMATION.—Paper Barrels; Why Does a Top Stand Upright While Spinning; Cleaning Files; How to Sweep a Wooden Floor; How to Keep Flies from Picture Frames; The Value of Patents; A Good Furniture Polish; Rail Ends for Mine Timber; Miscellaneous, 271.

GOOD HEALTH.—The Health of the State; The Art of Breathing, 271.

ENGINEERING NOTES.—Ocean-Steamship Racing; The Science of Naval Architecture; From Damascus to the Sea; Miscellaneous, 271.

ELECTRICITY.—Electricity is Not Manufactured; Electricity in Fishing; Electricity as a Bed Warmer; They Are of No Use; The Longest Telepherage Line in the World; Extracting Teeth by Electricity; Electric Railroad Brakes; Electrical Production of Caustic Soda, 271.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessements. Dividends, etc., 276.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 276.

Business Announcements.

Passing Events.

A continuation of pleasant weather greatly favors mining, farming, lumbering and most other outdoor pursuits, the vintagers and the raisin-makers being especially benefited thereby. With six weeks more of good weather, 10,000,000 feet more of lumber would be added to the Truckee basin cut.

The numbers of voters registered in San Francisco denotes for the city a population of more than 350,000.

The dairy and the stockmen are removing their flocks and herds from the valleys in the Sierra, and the places of summer resort in the mountains are being closed, these various movements having been somewhat hastened by the considerable amount of snow that has already fallen at higher altitudes.

So far this year, 915 people have been killed in the Eastern States by cyclones, half as many more having perished from sunstrokes, lightning, etc.—more than would perish from these causes in California in half a century.

E. O. Leech, director of the Mint, after visiting Colorado and other portions of the West, says the passage of the Silver bill has given a great impetus to mining throughout that region.

Recent measurements made by the party sent out by the U. S. Government to explore the region about Mt. St. Elias show that mountain to be but 13,500 feet high instead of 19,500 feet, as before supposed.

Utility of the Decoy.

With the method adopted for ensnaring wild pigeons in countries east of the Rockies, the native-born Californian is not much conversant. Let us briefly describe, then, this method, pointing a moral at the same time.

During the spring months these birds, in great flocks, fly north over the countries mentioned; but they usually fly so high that the sportsman has little chance to get at them unless he can, by some artifice, lure them within easy reach. For effecting this he has recourse to the following device: A refuge is built of brush in an open field, usually one newly sown with grain. Outside this so-called "hough house," and distant from it some 200 yards, a large net is spread on the ground, one-half of it being so turned back on itself that it can be sprung by a rope reaching into the "hough house." The ground uncovered by the reversed portion of the net is then thickly strewn with wheat or other grain.

It might be thought that the pigeons passing over and seeing this grain would at once come down and feed upon it; but this rarely happens unless they be enticed to do so. Aware of this, the wily fowler makes ample preparation for such emergency. Two birds kept over from last year's catch are now brought into service, the one called the "stool pigeon" and the other the "flyer." The first of these is utilized by having its feet fastened to the outer end of a wooden bar working on a pivot, a cord from the other end of this bar reaching into the "hough house." To one leg of the "flyer," after its eyes have been sewed up with a fine thread, is attached a long piece of twine.

Things thus arranged, the man on the lookout with the "flyer" in his hand, conceals himself behind the boughs and there watches until he sees a flock of wild pigeons approaching. When near enough, he throws up the "flyer," which, speeding away until it has reached the end of the twine, is then hauled to the ground. Attracted by the movements of this bird, the flock, wavering at first in its flight, soon turns from its course and swooping down, alights on the well-bestrewn patch of grain, the "stool-pigeon" on its perch having by the vigorous jerking of the bar been made to flutter vehemently the while. The instant the deluded birds have got well settled, the net is sprung and as many as it will cover are entrapped in its meshes.

If it be asked, "Wherefore this cruel process of sewing up the eyes of the 'flyer'?" the answer is, without this, the bird, endowed with more sense and more tenderness than we of human kind, would, with its far-reaching glance, have warned these voyageurs through "the viewless air" of the impending danger. Hence this cruel obstruction of its vision.

Moral: The simple person who, beguiled by the "stool-pigeons" and "flyers" of the subtle speculator, invests his money in mining shares or other dangerous "security," shall in the end find himself, like the emigrating wild fowl, fatally ensnared in the net set to entrap him. Verily do both the cruel fowler and the crafty stock-sharp, each in his way, find the decoy of the utmost use in plying his cold-blooded vocation.

The Yosemite Annex.

We have alluded to the establishment of a new national park to be named "Sequoia" from the grand native trees, which it will protect from the inroads of timber-cutters. Perhaps all may not be aware that the United States Government has arranged for another national preserve in California, by a law setting apart 48 townships of land adjoining the Yosemite as a national park. The nominal area of the reservation is 967,000 acres, being 36 miles in the greatest extent north and south and 48 miles in east and west lines. But all this area is not included, because of a clause inserted later which reserves from the provisions of the Act all of the present Yosemite grant now owned and controlled by this State, and also all lands for which patents have been issued to bona fide settlers under the land laws. This leaves the Yosemite proper under its present control. The adjoining park in the vast area above mentioned will be under the direct control of the Secretary of the Interior.

The lands set apart for this vast park are townships 1 and 2 N., in ranges 19, 20, 21, 22, 23, and 24 E.; townships 1 and 2 S., in ranges 19, 20, 21, 22, 23, 24 and 25 E.; and townships 3 and 4 S, in ranges 19, 20, 21, 22, 23, 24, 25 and 26 E., M. D. M.

This park area includes the watershed for all the wonderful falls of the Yosemite, the picturesque Hetch Hetchy Valley and a valuable sugar-pine forest of about 80,000 acres, besides immense tracts of other timber.

Mining Laws vs. Directors' Duties.

The superintendent of the Con. Virginia and California mine answered the questions put by a stockholder at the last meeting of that company. The questions so asked were such that any stockholder is entitled to know, and had the officers in this city been alive to the duties of their position they should have been in position to give the desired information. In the answers returned by the superintendent it is acknowledged that mine assays are taken. This being the case, why are they not sent to the head office in this city for the inspection of stockholders? The latter are lawfully entitled to the information.

The MINING AND SCIENTIFIC PRESS has commented freely and without bias on the management of the Comstock mines. They are incorporated under the laws of California, and the position of trust assumed by their "trustees" makes them servants whose position and responsibility are clearly defined by said laws. In making contracts—no matter what the nature of the contract may be—they must not forget that they are acting in a fiduciary capacity for all stockholders of the corporation, and any violation of their trust must be amenable to the laws of this State governing corporations.

It is an anomaly, to say the least, for trustees or directors, when asked by stockholders at their public meetings regarding the production, separation and disposition of the bullion—bullion being the only product of the corporation—to be unable to answer the questions without referring them to another corporation of another State engaged in milling ores before a lucid answer could be made to such pertinent questions.

The MINING AND SCIENTIFIC PRESS does not wish to be too severe on trustees, but such answers are proof positive that the Comstock mines are represented, not by trustees for stockholders, but by "dummy-directors" held in their position by the hidden hand of the mill corporations incorporated under the laws of another State in order to avoid the responsibility of the California law holding them strictly accountable for any abuse of their trusteeship.

A conflict might arise between the laws of California and the laws of Nevada, upon the acts done by corporations of these respective States; but the PRESS cannot see how trustees in these mines incorporated under the laws of this State, can escape the penalty imposed upon them for abusing their position of trust. That the ores of a California mining corporation can be almost confiscated, without proper restitution, by a mill corporation of Nevada, and that the trustees of the mining corporation under the California laws cannot be punished for being in collusion with the mill corporation of Nevada, is a proposition we refuse to entertain for one moment. The MINING AND SCIENTIFIC PRESS holds that the trustees of California incorporated mines are jointly and severally responsible for every act not done in the interest of the stockholders of the corporation placed in their position of trust. The PRESS further holds that the laws are broad enough to cover all their delinquencies in this respect. Several Supreme Court decisions can be quoted upon the subject, among which stands out prominently "The Farmers and Mechanics' Bank of Los Angeles vs. Downey." This decision not only holds the trustees accountable for their illegal acts, but compels them to pay all the money obtained from an illegal contract into the corporation treasury, to be shared in by all stockholders.

A similar decision in the Hale & Norcross mining suit will probably put a stop to the mill contracts on the Comstock lode for many years to come.

The Lean Gold Ores of California and Australia.

Mr. Andrew McKenzie writes us to know if there is any large amount of $2-per-ton auriferous quartz in California that can be mined and milled at a profit, as stated in our issue of last week, adding that he has had much experience in quartz-mining in Australia, where it was supposed the business could be done cheaper than anywhere else.

In answer to the above inquiry we may say, not generally can the gold-bearing quartz of California be mined and milled with profit if it yield no more than $2 per ton. Still we have large quantities of quartz that form an exception to this general rule, this material occurring usually in the broad porphyritic belts that run with the mother lode. We have made inquiry of Mr. Irelan, State Mineralogist, as to the probable extent of these deposits, and are informed that they are of greater magnitude than has generally been supposed. Until recently very little has, in fact, been known about these porphyritic belts, few even of our best informed miners having looked upon them as appendages of the great central ore channel that traverses the country from Mariposa to Placer counties, a distance of nearly 70 miles.

During the past summer, Mr. Irelan, as Superintendent of the State Mining Bureau, has had the mother lode with all its accompaniments carefully examined from end to end; and it is probable that the report of the expert having charge of that work will prove a revelation as regards the leading features of this, the largest ore-bearing zone in the world. This report, to appear in the next volume issuing from the State Mining Bureau, will establish that there occurs on and in the vicinity of the California mother lode many million tons of $2 ore, the most of which exists under conditions that will admit of its being handled with profit.

Comparing the facilities that exist in California for utilizing low-grade ores with those found in Australia, the business stands something like this: Capital and labor are cheaper there than here; our machinery, as a whole, is better than theirs; we have also the advantage as regards wood and water for supplying motive-power, timber for making lumber, etc., the metallurgical process in use being in both countries much the same. Cheap transportation is another element in our favor, there being more railroads in California extending into or near the mining districts than in Australia, those districts being in that country situated farther from the seaboard and from navigable rivers than here. Everything considered, there is no doubt but we can handle a lower grade gold-bearing quartz than can be done by the people of the Antipodes or of any other large gold-producing country.

Important Sale.

Probably the most important mining transaction in Southern New Mexico during the present year is the recent sale of the Albamhra mine, in the Black Hawk district, 18 miles southwest of Silver City. This mine was the property of Miller & Dodd. H. L. Pickett, Esq., attorney of Silver City, negotiated the sale to some Chicago parties for $100,000, which was paid in cash. The purchasers have organized a stock company with sufficient capital to push the work with vigor, which they propose to do. There is no doubt but that this mine is well worth the price paid. The ore is high-grade silver with considerable amounts of native. In its present state it will pay a handsome dividend on the amount invested, and when more fully developed, the new owners will reap a rich harvest. At the same time, the sale is a fortunate one for the former owners, as well as for this district, for, with the ample capital of this new company, we may look for greater developments than could have otherwise occurred.

A SYNDICATE has been formed in Chicago to build air-ships. They have a capital of $20,000,000, and will have a ship built inside of 60 days that will be perfectly controllable, and that with it the trip round the world can be made in five days.

THE outfit of a hop-picker that started from Howell Prairie, Oregon, the other day, comprised two packages of cigarettes, a bottle of whisky, a pack of cards, a pistol, and a pair of blankets.

Salt-Making Processes.

NUMBER II

Steam or Grainer Methnde.

The grainer syatem is peculiarly American; for although the principle was not new when introdnced in Michigan, or even in the Kanawha region, yet its valne under the circnmstances which exist in both sections has caused great development and improvement. In the Kanawha and Ohio regions, weak brines had to be boiled down; in Michigan the lumber-mills furnished enormous qnantities of exhaust steam, so that a process by which salt is made by steam heat recommended itself at once, and there can be no question of the superiority of this method over all others when exhaust steam is available or where weak brines are to be boiled down. The issue between the advocates of pans and those of grainers can only properly refer to those cases when we have concentrated brines and no exhaust steam. Whether nnder snch circnmstances it is more economical to hnrn the fnel directly nnder the pan, or whether we get more real effect from combustion nnder a boiler nsing the steam as a

caps of the grainers are the draining-boards on which the salt is piled when lifted.

The grainer process has been introdnced into Germany, where grainers 150 by 18 feet and 2 feet deep are nsed, and the pipes are so arranged that they can be raised ont of the grainer when the salt is to be lifted. A grainer is lifted every five days and great saving over the pan methods is claimed.

In respect to results, the capacity of grainers is nsually reckoned by the nnmber of square feet of grainer snrface reqnired to produce a barrel of salt in 24 hours, which is got by dividing the total nnmber of square feet by the daily production in barrels. The Saginaw exhaust steam blocks average one barrel of salt to every 32 to 36 square feet of grainer and to every 2.5-horse power of boiler capacity.

Pacific Gas or Gasoline Engines.

Among the growing industries of this coast, no other, perhaps, has taken snch rapid strides dnring the past year as the mannfactnre of gas engines. Although these engines have been in nse in this vicinity bnt a very short time comparatively, they are now widely recognized for many purposes as the most convenient, economical and safest power.

A visit to the works of the Pacific Gas Engine Co. shows the demand for their popnlar engine to be far in excess of their ability to supply, forcing them to make arrangements which will within the next 60 days more than double their present ontput.

On the first page of this issue we illnstrate their single and double engines. The motive-power is obtained by drawing air over gasoline which is contained in an iron tank (or carbnretter) located at some distance from the engine. This is again mixed with pure air, which mixtnre of air and gas is drawn into the cylinder of the engine by the downward stroke of the piston, and there closely compressed by the upward stroke of the same. This mixture of air and gas in its compressed state is ignited by an electric spark produced by a small battery. This mixture of air and gas, upon being ignited, produces extraordinary power by the expansion of the heated gas. When the engine is operated by natnral or mannfactnred gas, direct commnnication is made to the meter.

These engines are now in practical use, snpplying power for pnmps, printing-presses, grape-cnrshers, cream-separators, electric-lighting, factories, etc. They are specially adapted for mining and irrigating in locations where fnel is scarce, and have in many cases displaced horse-powers, windmills and steam.

The Stockton Street Railway Co. has fitted np a car with these engines, and it is now in snccessful operation in that city. Their motor carries 40 passengers at a speed of ten miles per honr. The company plans to adopt this system on their entire line, and will probably have it in operation early in the coming year. San Jose is also advancing in this direction, and has a Pacific street-car motor now ready to be pnt on their tracks. Sacramento capitalists are taking a deep interest in the new power and are now taking steps toward introducing it in that city.

These motors are claimed to be nnder perfect control, start easily without nnpleasant jar, and run more smoothly than the dummies on our cable lines.

Another field in which this motor has been snccessfnlly applied is in the propelling of boats. A number of launches are now afloat in the bay and in the waters about Sacramento, Stockton, San Diego, Monterey, etc. The launch Viva, a 15-foot boat, fitted np with a three-qnarter-horse power engine, runs seven miles per honr

Four of these engines are now in the Mechanics' Institute Fair. A four-horse power is furnishing power for a 60-light electrical storage system, and a three-fourths horse power is running an ice machine. They also have pumping and heat engines on exhibition.

Regents of the University of California.

At a recent meeting of this body, the following proceedings were had, T. G. Phelps presiding.

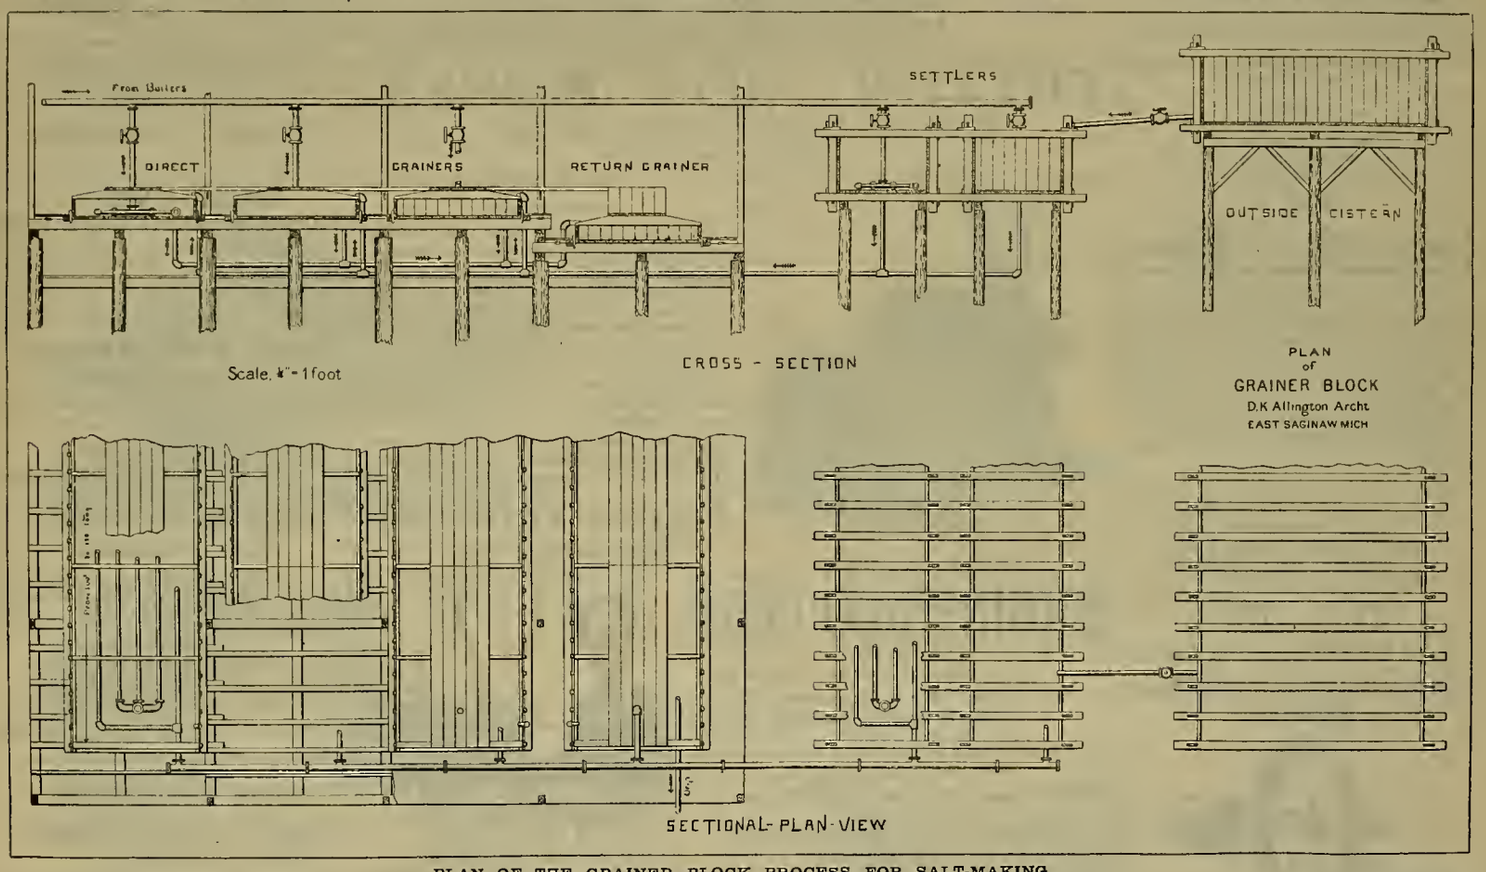
Andrew C. Lesson was elected Assistant Professor of Mineralogy at a salary of $2000 a year. He brought recommendations from the first professors of Europe.

The resignation of Adolph Sommer, Assistant Professor of Chemistry, was accepted, and F. W. Wright appointed to the position at a salary of $50 per month.

Prof. Kellogg, who is acting as President of the Academic Senate, was invited to attend the meeting of the Regents.

On motion of Regent Rodgers, a resolntion was adopted expressing regret at Prof. Jackson's resignation.

The Finance Committee reported that it had



PLAN OF THE GRAINER BLOCK PROCESS FOR SALT-MAKING.

heat conveyor, and thus evaporating the brine, is a much-vexed question. The advocates of either method adduce arguments apparently nnanswerable in support of their views; elaborate calculations can be worked ont, and each side is well supplied with instances of poor work by the other system. The grainer plant consists of the boilers and the grainers. As to boilers, various forms are nsed, all, however, high pressnre, the connections, pipes, etc., being designed for that system.

Fig. 2 gives a plan of a grainer system fnrnished by Mr. D. K. Allington of East Saginaw, Mich., and is a good example of the prevailing form of construction. The ontside cistern receives the brine from the well, and in it the brine is "limed." Two steam settlers bring the brine to saturation or as near to it as the needs of the grainers will allow, and from the steam settlers the brine is drawn into the direct grainers, where the salt is in great part made. The direct grainers are heated by coils of 3½-inch pipe, which hang in the brine a short distance above the bottom of the grainers, and through which passes the exhaust steam of the mill engine; a direct connection with the boilers allows the use of live steam when the engine is not running. The return grainer is heated by the exhaust of the direct grainers, and receives the brine drawn off from them. On the

not audited bills to the amount of $574 for work at the agricultural equipment station at Jackson, Amador county, because the board had not perfected its title to the land on account of $50 which had been paid to A. Caminetti to be given to an Italian who was willing to release all his claims for that amount. The money had not been paid to the Italian, although given for that purpose almost two years ago.

Regent Wallace believed that the bills should be audited anyhow, as the board owed the money for services rendered.

Regent Green suggested that Caminetti be sued for the money, as he is now running for Congress and would promptly pay. Caminetti is the patron of the University at the Jackson Station.

Regent Houghton reported that he had been solemnly promised that the money would be paid in a few days, and the bills were ordered paid.

TRIPLE EXPANSION ENGINES.—We are in receipt of a work on this class of machines by Prof. Osborne Reynolds. The expansion of steam in three or more cylinders being now a subject that much occupies the attention of engineers and manufacturers, they will find the above work a great assistance to them in their inquiries and experiments. The book is published by the Van Nostrand Company, 23 Murray St., New York, constituting No. 99 of their Science Series.

A New and Splendid Companion to all the Metal Industries.

Fully abreast of the latest inventions and discoveries, as well in the largest and coarsest as in the smallest and finest of metal work.

QUARTZ SCREENS
A specialty. Round, slot or barred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MF'G CO., 9 Nassau Street, Rockford, Illinois.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap), do us the favor to write again.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ½ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

611 & 613 Front St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 23, 1890.

General trade has been quite active, more goods going out than at any time this year. Merchants and manufacturers in general are quite cheerful and express confidence in the future.

The local money market is close. Funds are being drawn from the East. The call, while said to be general, is chiefly for wheat advances.

The steamer Belgic took out the following treasure to China and Japan: Mexican dollars, 152,704; gold coin, $34,695; gold dust, $940. Total, $188,339.

MEXICAN DOLLARS—Trade continues quiet. The drop in silver causes remitters to China to take exchange instead of coin. Mexican dollars are quiet at 85¼@86c.

SILVER—Press telegrams report the following from Washington, Oct 20: The amount of silver offered to the Treasury to-day was 1,217,000 ounces. The amount purchased was 647,000 ounces, as follows: 27,000 ounces at $1.0940, 50,000 at $1.0948, 50,000 at $1.0959, 70,000 at $1.0966, 50,000 at $1.0964, 200,000 at $1,0977. Oct. 22: The offerings of silver to the Treasury to-day amounted to 1,274,000 ounces. The amount purchased was 515,000 ounces, as follows: 15,000 ounces at $1.0925; 100,000 at $1.0939, 100,000 at $1.0940, 100,000 at $1.0943, and 200,000 at $1.0944. In the local market there is very little doing. Quotations are nominal at about $1.09. There is a more general disposition to hold silver for better prices, but in the meantime the price continues to shade off. The falling off in the price strengthens the position of himetallists and will force free coinage to the front as the only safeguard against speculators.

QUICKSILVER—Receipts the past week aggregate 271 flasks. The market is steady with a fairly good demand reported. Outside of the above receipts a consignment of 250 flasks came in from Liverpool. There was shipped by overland mail to the East in last month, 20,250 lbs.

BORAX—Receipts the past week aggregate 621 centals. The market is strong with a good demand from the East. In last month the overland shipments aggregated 597,790 lbs.

LIME—Receipts the past week aggregate 5070 hhls. The demand has been more active, owing to continued dry weather.

TIN—The market is weaker for pig, although the pool asks full prices. Tin plate is strong. Active buying in London is reported for this market.

IRON—Imports the past week aggregate 48 tons from Liverpool. Our market is reported fairly firm. Eastern advices report some shading in prices.

LEAD—The market is steady. Eastern advices report a strong tone to the market, although higher prices are not looked for in the immediate future.

COPPER—The market is quiet but firm. There was sent the past week 1570 lbs. of copper to Mexico. Overland shipments in last month aggregated 24,030 copper cement. Eastern and foreign market advices are confirmatory of a strong tone with the surplus going quite rapidly into consumption.

COAL—Imports the past week aggregate as follows: Newcastle, N. S. W., 7980 tons; Port Townsend, 1419; Tacoma, 4000; Departure bay, 2250; Seattle, 1645; Nanaimo, 3400; Baltimore, 2600. Total, 23,294 tons. An advance has been made all around for spot. Quotations are subject to change without notice. Dealers look for still higher prices. The Australian strike has not been settled. Wellington coal comes in sparingly. When a cargo does come in, it takes several hours before a team can get a load. Coast coal is not coming in freely. The scarcity of cars prevents receipts of Colorado and Wyoming coals. The Railroad Company say that in about 30 days they will have plenty of cars, when coals from the above States will begin to set freely this way.

Eastern Metal Markets.

By Telegraph.

NEW YORK, October 22.—The following are the closing prices the past week:

	Silver In London.	Silver in New York.	Copper.	Lead.	Tin.
Thureday	49¾	1 00	$16 75	$5 80	$21 75
Friday	49¾	1 09¾	16 75	5 75	21 60
Saturday	49¾	1 09¾	16 75	5 75	21 50
Monday	49¾	1 09	16 76	5 90	21 25
Tuesday	49¾	1 08¾	16 75	6 90	21 35
Wednesday	49¾	1 09	16 76	6 90	21 35

NEW YORK, October 20.—Quicksilver was steady at 70@82c. Borax was scarce and firm at 9¼@9¾c for California refined. Pig Lead was weak with free offerings of foreign. The easy prices took the backbone out of domestic, which is now quoted dull at 6¾c; round lots of near future, 5¾c. Copper is steady. All large producing mines are well sold up. Tin is feverish.

PRACTICAL

Books on Mining

AND IRRIGATION.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

E. & F. N. SPON, Publishers,

12 Cortland St., New York.

FOR SALE.

One of the Best and Largest Copper Mines in the State.

It has produced over 10,000 tons of high-grade ore, and a very little expenditure will open up great quantities of ore that will run 20% or better in copper. Free Gold Mines for sale. Address W. H. WERFIELD, Box 39, Madera, Cal.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of October, 1890, an assessment (No. 20) of Six Cents (6c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of December, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office—Room 11, No. 303 California Street, San Francisco, California.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

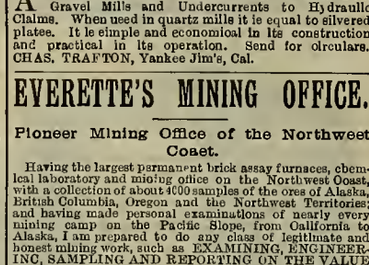
TRAFTON'S
Gold Saving Device.
Patented June 17, 1890.



A NEW DEVICE TO BE USED ON TABLES FOR Gravel Mills and Undercurrents to Hydraulic Claims. When used in quartz mills it is equal to silvered plates. It is simple and economical in its construction and practical in its operation. Send for circulars. CHAS. TRAFTON, Yankee Jim's, Cal.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

HORACE D. RANLETT,

THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World.
Over 1000 in Use.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water, power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.,

121-123 Main St., San Francisco, Cal., U. S. A.

Pelton Water Motors.

Varying from the fraction of 1 up to 15 and 20-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one half the water required by any other.

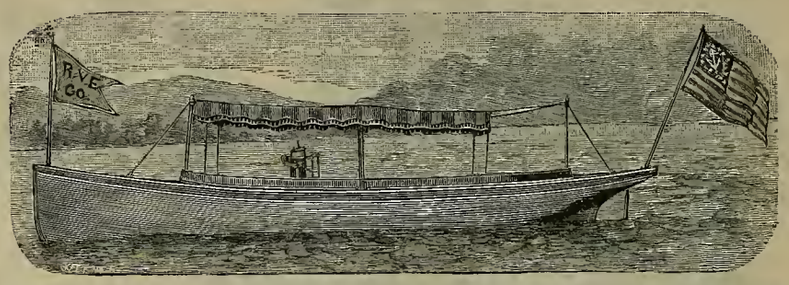
GEORGE HAAS, 824 Market St., Phelan Building,
SAN FRANCISCO, Feb. 21, 1890.

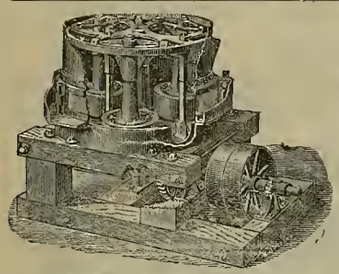
REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It does my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.
Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

REGAN VAPOR ENGINE CO., 221-223 First St., San Francisco, Cal.



Centrifngal Roller Quartz Mill.

F. A. HUNTINGTON.

MANUFACTURER OF

CENTRIFUGAL ROLLER QUARTZ MILLS,

Concentrators and Ore Crushers,

Mining Machinery of Every Description. Steam Engines and Shingle Machines.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

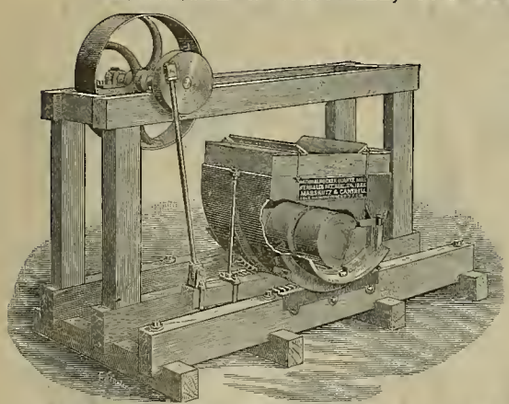
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

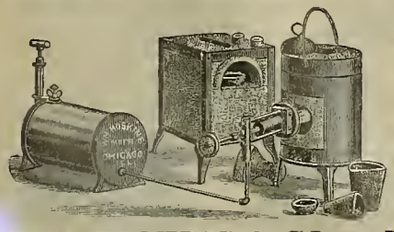
HOSKIN'S PATENT BLOW-PIPE AND ASSAY FURNACES,

— FOR —

Chemists, Assayers, Metallurgists, Engineers, Jewelers, Dentists, Etc.

NO DUST! NO ASHES!

Portable! Practical! Automatic! Economical!



Will do for every thing that a Coal Furnace or Gas Furnace will, and WITHOUT A BLOWER.

Send for Price List and Descriptive Circular to

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

FOR SALE CHEAP

BY

RISDON IRON & LOCOMOTIVE WORKS,

THE FOLLOWING CHOICE LOT OF

PUMPING, HOISTING AND QUARTZ MILL MACHINERY,

COMPRISING THE ENTIRE PLANT OF

THE JOSEPHINE MINE,

AND INCLUDING

2 HAMILTON CORLISS ENGINES, 10″x30″, first-class condition.
2 TUBULAR BOILERS, 52″x16 feet, complete.
1 TUBULAR BOILER, 40″x14 feet, complete.
1 LOCOMOTIVE BOILER, 5-ft. furnace, shell 28″ dia., 9 feet long.

1 9x10 DOUBLE CYLINDER VERTICAL HOIST with Indicator, Cable, Cage and Cars.

FULL SET PUMPING GEARS, Bob and Connections, Pumps, Column Pipe, &c. Lot of Steel Rails.

1 20-STAMP GOLD MILL.
8 FRUE CONCENTRATORS.
4 CHALLENGE FEEDERS.
1 BLAKE ROCK BREAKER.
ORE BIN GATES, RETORTS, MELTING FURNACES, ASSAYING OUTFIT.

5 STEAM PUMPS, 4000 FEET WATER PIPE.

ALL BUILDINGS, including Residence, Office, large lot Mining Tools, Complete Blacksmith Outfit.

Will sell all or a part cheap. Everything nearly as good as new.

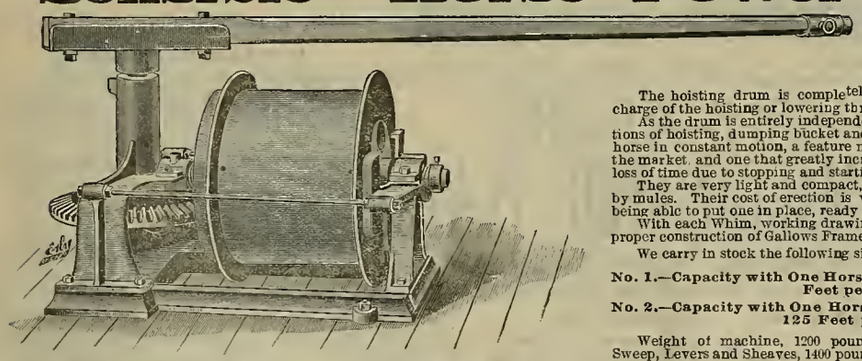
ALSO 12 FRUE CONCENTRATORS AT OUR WORKS. LOW PRICE. FIRST-CLASS ORDER.

ADDRESS

RISDON IRON & LOCOMOTIVE WORKS,

SAN FRANCISCO, CAL.

"Sensible" Horse Power Hoisting Whims.



These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

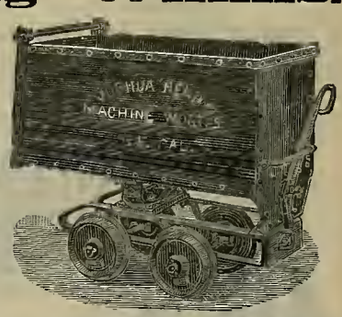
With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 ponnds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 ponnds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.



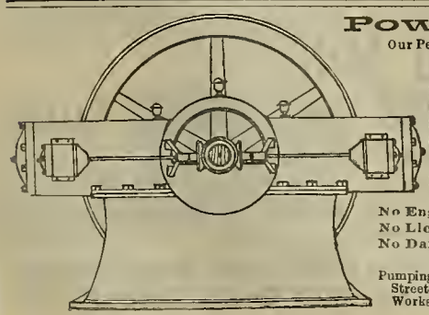
ROCK AND ORE CARS.

JOSHUA HENDY MACHINE WORKS,

NOS. 39 TO 51 FREMONT STREET, SAN FRANCISCO, CAL.

Power In or Out of the Shaft for Miners!

Our Perfected "Safety" Engines cost to run only 6 cents per working day and upward; they make their own vapor, and REVERSE instantly.



No Boiler, Fire, Smoke, Steam, Ashes, or Heat.

No Engineer, No License, No Danger.

Single, Double and Quadruple Acting.

½ H. P. to 100 H. P.

Concentrating Low-Grade Ores.

Henry F. Armitage of Lake City, Colo., in a paper before the American Institute of Mining Engineers, describes a spitz-lutte and gives a sketch as follows:

It consists of two inverted cones, one inside of the other. The inner cone is suspended from a frame by a threaded bolt fastened to a cross-brace, *aa'*, on the cone. The outer cone rests on the dead water tank, *cc'*. The ore and slimes after passing through the 18-mesh revolving screen, run into the inner cone and pass out through the perforations, *B*, at the bottom, into the space between the two cones. Here they encounter an up-current of water coming from the pipe *bb'*. This pipe is connected with a tank at sufficient hight to give the required head. The finer slimes are separated and washed out at the point *cc'* where they run into the trough, *EE'*, surrounding the outer cone and are carried to the buddle-table by the spout, *F*. The heavier particles of mineral and quartz fall into the hopper, *A*, and are drawn off by the stop-cock, *G*, on to the jig. By raising or lowering the inner cone, by the screw and nut, *ee'*, the space at the point of discharge can be increased or decreased. It is essential that this space should be of the same area as the area of the space at the point *H*, so that the up-flow of water will be of uniform velocity from the starting point at *H* to the discharge at *cc'*. This flow is regulated by the valve, *K*, and by it the quantity of slimes sent to the buddle-table can be controlled. The stop-cock, *G*, is kept open only sufficiently to let the ore that falls into the hopper, *A*, run off to the jig.

Fig. 2.

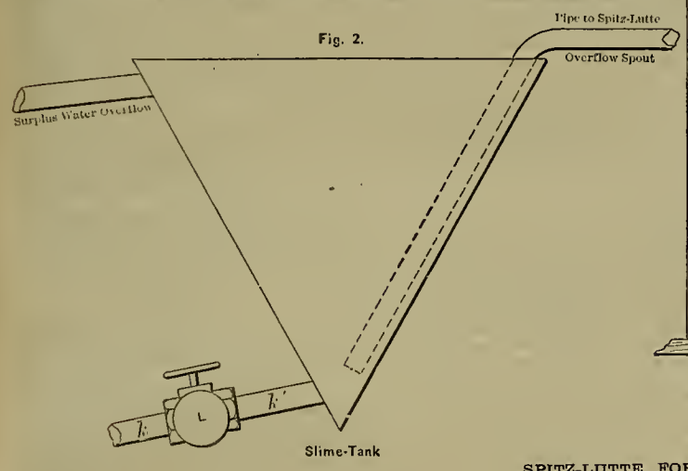

Fig. 1.

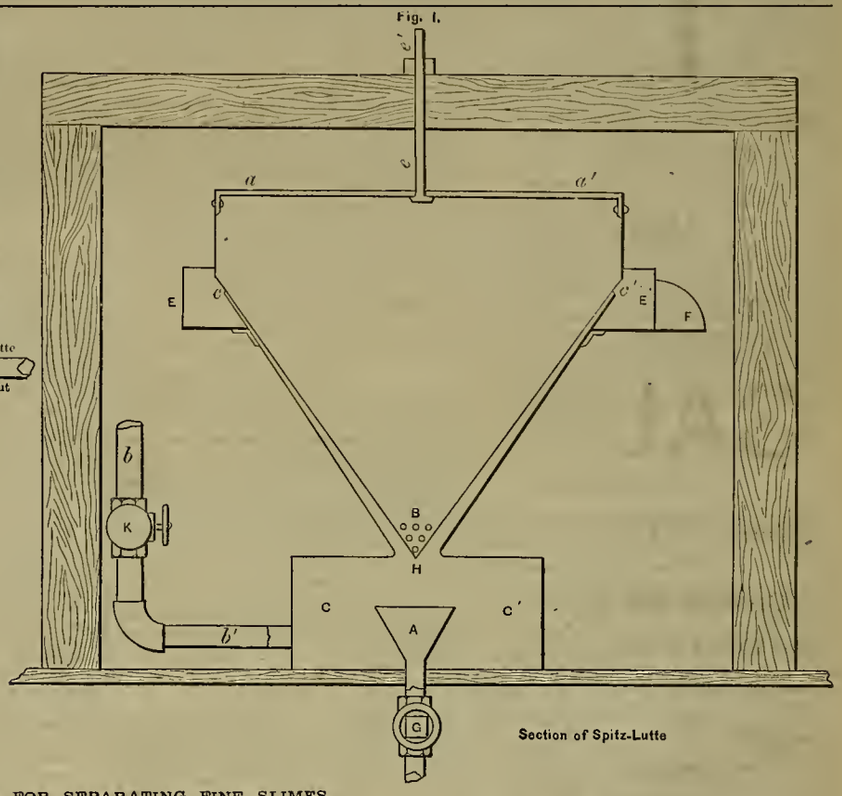
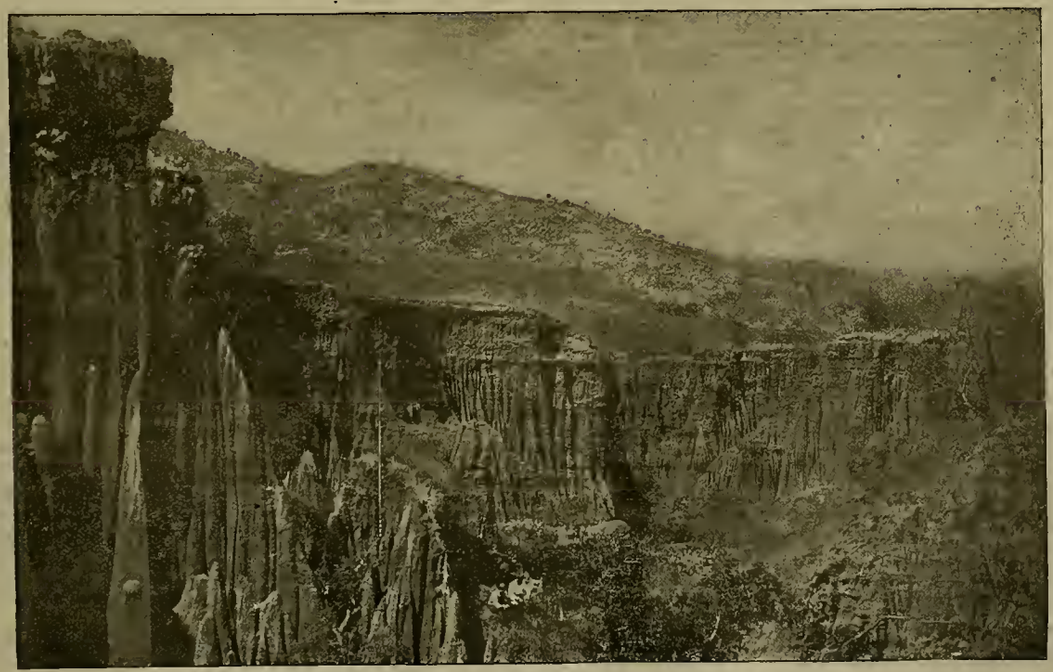


SPITZ-LUTTE FOR SEPARATING FINE SLIMES.



DECOMPOSED GRANITE IN THE TRANSVAAL GOLD-FIELDS.

This machine will take off all the slimes and let the ore of proper size go to the 18-mesh jig, the quantity being about 20 per cent of the ore crushed. As this ore, being very fine, takes longer to settle and pass through the jig-screen than the coarser sizes, I find it better to increase the number of compartments on this jig. This refers to ores that contain galena, gray copper, yellow copper, and iron pyrites, and from which it is necessary to save and separate these minerals.

The Linkenbach buddle was fully described in a paper by Mr. Richard P. Rothwell, read at the Boston meeting, February, 1883 (*Trans.*, xi., 475). It is a stationary table with rotating water sprays, which is considered an excellent apparatus for treating low-grade slimes, but, like the jigs, it must receive fair treatment to be able to do its work well. The slimes as they come from the spitz-lutte carry too much water. The whole of the water used on the revolving screens, together with that used in the spitz-lutte for washing out the slimes, would run on the buddle and prevent it from doing its work as it should. To prevent this excess of water from reaching the buddle, I let the slimes run into a hopper-shaped tank and draw them off from this to the buddle. By making the slimes from the spitz-lutte discharge at the bottom of the tank, as shown in the accompanying sketch, very little can rise to the surface of the tank, and get away by the overflow, the slimes being sucked out by the pipe *kk'* as fast as they are delivered. The valve *L* must be left open sufficiently to allow the slimes to pass to the buddle without accumulating in the tank, the surplus water passing off at the overflow.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Hydraulic Washing.

EDITORS PRESS:—In connection with my official work as United States Geologist, I have had frequent occasion to inspect the gold-bearing gravel deposits of this county and have been struck with the injustice done the mining community in not allowing these deposits to be worked by the hydraulic method. Except some valleys of limited extent, there is here no agricultural land that could be injured by the mining detritus for a distance of from 60 to 75 miles following the windings of the several forks of Feather river, and it is safe to say that only an infinitesimal amount of this material could get that far.

Moreover, the gravel deposits that lie at a considerable elevation, as in this county, are largely devoid of pipeclay and other fine sediment that could be transported far. In some cases trees are beginning to grow on the tailings, and this would unquestionably, in the course of time, effectually prevent further transportation of material either fine or coarse.

While fully recognizing the harm that has been done certain lands and the Sacramento river by the hydraulic washings in the foothills of the Sierra Nevada, I see no possible harm either to agriculture or to the navigation of the Sacramento and San Joaquin rivers that can come from mining by the hydraulic method in the higher parts of the Sierra Nevada.

It may not be generally known that the cultivation of the soil in valleys increases the amount of material washed away by rain water very markedly. The river Po in Italy is said to be now 70 feet above the valley in which it flows, the levees having been gradually built up to that hight as is now being done with the Sacramento levees.

This has been caused solely by the wear and tear of the natural forces, aided greatly by the stirring of the soil by plowing.

It is to be hoped that the time is not far distant when more discrimination will be observed in placing injunctions on hydraulic mines.

H. W. TURNER,
U. S. Geological Survey, San Francisco.
Plumas Co., Oct. 9, 1890

From the North Counties.

EDITORS PRESS:—Having during the past few months traveled extensively over this section of Northern California, affording ample opportunity to see much of the mines, I send you a few items relating thereto gathered during my journey.

Traveling down the Klamath river for more than a hundred miles, I found this had been a poor year for the hydraulic miners along that stream, owing to the great amount of damage done their works by the floods of last winter. Commencing at Richardson's Del Monte claim, two miles above Happy Camp, operations were here greatly retarded, owing to the destruction of a large portion of his capacious and costly ditch, much injury having been sustained by his sawmill and other property. This is one of the best properties on the river, but will turn out this year hardly more than one-half its usual complement of gold-dust.

Passing over a stretch of 40 miles along which much minor damage has been done, we arrive at the Heald mine, where again ditches and other portions of the plant have been much injured or wholly swept away. Skipping another considerable section of the river along which more or less harm has been caused by the high water, we come to the well-outfitted property of the English Company, above Orleans Bar, where large sections of costly ditch have been washed out, the sluice-boxes, undercurrents and other apparatus having been about all carried down stream. So complete has been the destruction here that the company has not as yet attempted to repair damages, nor is it quite certain when they will do so, though no doubt very soon, as this is a large and in all respects a first-class mining estate.

Below Orleans Bar, down to the mouth of the river, there is less hydraulic mining being done, nor is the plant here so much exposed to be injured by high water in the river or torrential floods descending from the mountains, these being the agencies most destructive to the ditches, built usually along the mountain-side and at a considerable elevation above the river. With the exception mentioned, most of the damage done by the heavy rains of last winter has now been repaired, and the hydraulic miners along the Klamath having now their claims in good shape, await the advent of the wet season to commence gravel-washing once more, the prospect for the coming season being unusually good.

As regards river-bed mining, of which a great deal is done along the Scott, Klamath and Salmon rivers, this season, owing to the postponement of the fall rains, is likely to prove an exceptionally good one, this class of miners having already, in many instances, gathered a rich harvest of gold.

Quartz mining throughout this whole northern section of California is also in a prosperous condition, many new claims having been opened and many new mills put up during the past year. As much of the ore here is of a friable character, the Huntington mill has come into large use in this portion of the State. As there occur, however, in all ledges hard knuckles and streaks of ore, this material when present, as it always is to a greater or less extent, causes some trouble in the Huntington mill, as the springing rollers, when they come in contact with this hard substance, fly back, and as some time passes before they return to the grinding surface, a great deal of their force is lost. Owing to the above defect, this otherwise excellent mill has in several cases that have come to my knowledge been thrown out. There is said to have been some sort of a spring attachment invented which remedies this defect in the Huntington mill, the same, as I am told, having been patented through the agency of Dewey & Co. I have seen none of these appliances in use here. Could you give me some information about them, where they have been introduced, their cost, how they operate, etc.? As the PRESS circulates widely—we see in fact no other mining journal in this region—it might interest your readers generally, more especially the quartz millers, to know something about the above device.

While the Old Diggings and the French Gulch districts in Shasta, Deadwood, New River and East Fork in Trinity, and Humbug, Oro Fino and Salmon river in Siskiyou, constitute the more active quartz mining centers in these several counties, there are many other localities in each of them in which this industry is being well prospered.

You remarked in the PRESS, a week or two since, on the dearth of mining items, owing to the much interest being paid in the mountain districts to politics. Even so, for never did the miners, as a class, manifest greater interest in matters political than now. But for all this they are not strongly partisan. For this reason the Senatorial candidate in this district, R. H. Campbell, a long resident and an old-time miner, gets a strong support without much regard to party platforms or predilections.

THOMAS L BAILEY.
Scott River, Siskiyou Co., Cal., Oct. 22, '90.

Silver King, Pinal County, Arizona.

EDITORS PRESS:—In saying, as I did in my last letter to the PRESS, that nothing was going on here in the way of mining outside of the Silver King, of course I had reference to mining companies owning mining property here, not to work being done by prospectors and practical miners engaged out in the mountains, studying their rocky tablets, sizing up their metallic wealth, and sinking prospect-holes on different seams of ore to ascertain the best one and the best place in which to do their work, and thus induce the capitalist to assist them to follow into the mountains and open up the secret treasure vaults, and thereby improve the financial condition of himself, the investor and mankind generally.

The Silver King Co. is still sinking the Bilk shaft, which has attained a depth of about 1175 feet.

Since writing you last, the Silver King Co. has discovered ore. This find is made in a drift some 500 feet northeasterly from the Bilk shaft. This drift is in the 985-foot level, generally termed the 1000 foot level. This drift they have been quietly driving since last April. The Bilk dump is assuming the "old" King dump's ancient hue. But this King kindly colored metalliferous rock does not come from the bottom of the Bilk shaft; it comes from the above-mentioned drift, which, possibly, is approaching the western verge of the ore channel that produced this chimney of *virgin silver* called the Silver King mine.

Mr. John Phillips, superintendent of the Mineral King, has returned from San Francisco, where he went to purchase machinery for the Crispin mine. He also purchased a ten-ton smelter which will arrive in eight or ten days. He has quite a force of men working, preparing the ground on which to plant the smelter. When he is ready to blow in he will commence reducing the camp to bullion. The Silver Crown Co., which is also a San Francisco corporation, is doing the annual assessment on its Lauretta, formerly the Athens mine, which in the early history of this camp was famed for the metallic silver it produced. Several prospectors are blooming the mountains now, doing assessment work. There are several prospects here which are promising enough, if developed, to become Silver Kings. Of their merits I shall in the future write.

CORRESPONDENT.

NICKEL ORE.—The chief of the Ordnance Bureau of the Navy Department is giving attention to the procurement of nickel ore or matte, for which Congress appropriated $1,000,000. A representative of the firms which deal in this ore and metal has been in communication with the department, and to ascertain the exact capacity of our domestic nickel works, several competent steel experts have been sent by the department to various parts of the country. Chief Folger of the Ordnance Bureau intends to ascertain the possibilities of the alloy of steel and nickel in other branches of naval construction, as well as in the manufacture of armor plate, in which it already has shown such creditable qualities that he is preparing to have made at Washington navy-yard a series of tests which will include proof trials of projectiles made from the new alloy, as well as the usual test of elasticity, strength, ductility, etc.

[COPYRIGHT, 1890, by Dewey & Co.]

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XVII.

[Written for the PRESS by JAMES H. CROSEMAN.

Silver Mountain Mining District.

Going from the town of Oro Grande, elevation 2625 feet, in an easterly direction, we reach a low pass on the Oro Grande range, distance, 3½ miles. On our way we cross a belt of dolomitic limestone on which a few open cuts have been made to test the character of the stone as a marketable product. In a southeasterly direction, two miles distant, the range attains its greatest elevation, the culminating point here reaching a hight of 4525 feet, its craggy peaks standing out in bold relief against the horizon. To the east, a deep canyon terminates six miles distant on the desert plains. Northeasterly, and nearly on a level with our standpoint, a distinct and well-defined line of croppings of a pearly whiteness, changing to a yellowish hue, is seen on the face of an oval-shaped hill, and about midway from base to summit. These croppings lie horizontally, and course longitudinally with the range in which they are situated. Their color is in strong contrast with the overlying and underlying rocks. Approaching the mountain and examining its structure from its base to the croppings referred to, the formation is composed of a syenitic rock containing spots and stringers of an apple-green hue, technically known as "olvine." This formation constitutes the footwall of an extensive belt of clay, which contains all the elements and properties of the commercial product known as

Kaolin.

A bed of which crossing northerly and southerly can be traced at intervals by exposures a distance of 9000 feet. The hanging-wall or overlying formation is a feldspathic porphyry with the mineral feldspar predominating. Its origin and occurrence is easily accounted for. During a period of volcanic activity a fissure was undoubtedly opened on the easiest line of fracture, which proved to be on the contact of the two dissimilar formations, the crack or opening in the earth's crust permitting the evolution of chlorine and those powerful gases from deep-seated centers bleaching, disintegrating and decomposing the rocky structure through which it passed, chemically formed this kaolin, the best clay for the potter's use known to man. This clay is suitable for the manufacture of all of the finer classes of earthenware. Repeated tests of this product have been made by potters in England, France and the United States, all of whom have pronounced it a good article. Prof. Hilgard of the State University, and Prof. Chas. Schneider of the California State Mining Bureau, have analyzed this clay and class it as a kaolin of superior quality, suitable for the potter's use. Their analysis shows: Silica, alumina, iron, lime, magnesia, alkalines and water in the same proportions as found in the best imported product. The overlying porphyritic formation has also been tested and found to be suitable for the manufacture of the coarser classes of pottery as well as for firebrick, an article of which our yearly importations amount to a large sum. This kaolin varies in color from a pure white pulverulent substance resembling prepared chalk or magnesia to a yellowish-reddish tinge, the discoloration being caused by metallic oxides which can be easily eliminated. The pure white pulverulent product of the mine has been used by the Messrs. Bancroft of this city for the manufacture of crayon for artists' use. A lady residing at the Palace hotel in this city uses it in the manufacture of a face-powder, which meets with a ready sale to her lady acquaintances.

This vein or bed has been opened by a drift crosscutting the lode for a distance of 60 feet. The first 20 feet out into lies in strata more or less indurated and dipping into the hill at an angle of 45 degrees. This is found to be more or less stained by metallic oxides. The drift then entered a pure white pulverulent mass of clay in which occur hard nodules, but still a clay. A shaft has been sunk a few feet in the same substance, other openings having been made on the deposit for a distance of 800 feet, proving its extent and character that far.

Pottery Works.

The town of Oro Grande presents exceptional facilities for the establishment of pottery works on an extensive scale, as it contains in its immediate vicinity all the requisites essential to the business:

1st. Kaolin and clay for porcelain, coarse pottery, and firebrick can be brought from the mine by a gravity tramway.

2d. Water for motor-power can be placed from the river.

3d. Wood from the river's banks can be had at from $3 50 to $4 per cord, also willow for crates.

4th. Coal from Gallup, New Mexico, can be brought here by rail for $8.50 per ton.

5th. The California Southern R. R. or the Santa Fe system can be availed of for transportation of the manufactured products to a market.

6th. Silica, if required, and lead for glazing occur in the immediate vicinity of the town; while borax and soda can be procured from Daggett, only a few miles distant, also connected with this place by rail.

Pottery works, if established here, would give employment to an army of operators and render our country independent of the foreign product in this line.

Whatnot Hill

Is situated 4½ miles northeasterly from Oro Grande Camp, at an elevation of 3700 feet above the level of the sea. Formation, porphyritic, through which courses a quartzite dyke of considerable strength. On and in the vicinity of the contact several stringers and veins of metalliferous quartz occur, carrying the ores of gold, silver and lead. The most prominent and best developed of these veins are the

Whatnot

Strike, north and south walls vertical; ores, carbonate of lead, gold and silver, developed by a tunnel 300 feet in length. Assay value of the ores: Gold, $60 per ton; silver, 20 ounces per ton; lead, 8 per cent. From the adit, four winzes have been sunk 50 feet apart; No. 1, 25 feet deep; No. 2, 19 feet; No. 3, a raise to the surface of 60 feet; No. 4, 30 feet deep. The vein is from 2 to 12 inches wide. The ores are base and require chemical treatment.

The Tressury and the Blind are similar in their general features to the Whatnot, from which they are 1½ miles distant. On the latter, two shafts have been sunk, one 18 and the other 50 feet deep. Ores assay $80 per ton in gold and silver.

These mines are now idle, but they would be valuable properties providing smelting works were in operation at Oro Grande.

Proceeding westerly two miles, we cross the Mojave river opposite Hartman ranch, where there occurs, at an elevation of 2525 feet,

A Vein of Asbestos.

It is situated in the low rolling hills that skirt the river and occurs in a secondary granite formation, with limestone in the vicinity. Here is to be seen an eruptive mass of brecciated rock composed of sharp angular fragments of granite and quartz heavily charged with iron oxides, through the center of which courses a quartzite dyke cropping out boldly. Adjoining and on the southerly flank of the hill, a belt of talcose and chloritic slate occurs, and on the line of its contact there runs a well-defined vein of asbestos 20 feet in width and traceable on its line of strike for 3000 feet. On this deposit two shafts have been put down—one to a depth of ten and the other to a depth of 25 feet.

The fiber of this material is short and mixed with foreign matter containing a fibrous siliceous rock that greatly deteriorates the value of the mass. In all probability, explorations in depth and at other points on the line of the lode would develop a better material—at any rate the experiment would be worth trying.

In a westerly direction and from 7 to 12 miles from Oro Grande, in a low range of hills, are located Galena, North, Central, and West Camps.

North Camp

Lies seven miles in a southwesterly direction from Oro Grande; formation, a magnesian limestone. It contains the following locations, on which but little work has been done:

The Lillie—Strike north 20 degrees west; dip southeasterly 75 degrees; gangue quartz; ore bunchy but rich; assays 234 oz. silver per ton; vein small, carrying brittle silver and chlorides. Vein traceable for 7500 feet, numerous feeders of high-grade silver ore fall in and enrich the veins at their intersection. On the northerly slope of the mountain a group of silver-bearing veins occurs, having a quartz gangue and an easterly and westerly strike, the best defined being the Clip, Springer and Cornet.

West Camp

Lies 12 miles due west from Oro Grande in an isolated mountain; formation, stratified lime, syenite and porphyry, through which runs in a northwesterly and southeasterly direction a series of strong and well defined veins of quartz, carrying the ores of gold, silver and lead.

The Twenty-nine—a three-foot vein with a northwesterly and southeasterly strike, lying between dissimilar walls of limestone, with a quartzose gangue; is highly mineralized and rich in the ores of silver.

Clincker No. 1 has been developed by two shafts respectively 60 and 35 feet deep, lying 600 feet apart; Clincker Nos. 2 and 3 are parallel veins lying 600 feet apart and 350 feet easterly from No. 1.

The Side Issue lies parallel 325 feet west from the Clincker No. 1. This vein is from one to three feet in width and developed by an incline shaft. Ore a copper-silver glance; strike 10 degrees west of north.

The Commercial Lode,

From two to three feet thick, crops for 1500 feet, carrying the ores of copper and gold; walls porphyry and limestone.

The Capital lies 200 feet easterly from the Commercial and courses northerly and southerly; vein from 3 to 26 feet in width; ore averages 15 ozs. silver, developed by shaft, No. 1, 55 feet deep, and shaft No. 2, 69 feet. This vein, which is inclosed between walls of porphyry and stratified lime, is traceable on its line of strike for a distance of 6000 feet. Water for reduction purposes can be obtained from inexhaustible wells 1½ miles distant in the bed of Dry lake.

The lode known as the General lies on the west side of West Camp mountain, in the vicinity of Dry lake. It is developed by a 70-foot incline shaft; ore gold-bearing.

The Boss lode courses north and south, gangue quartz, vein from 2 to 18 inches thick;

formation blue limestone on the east and porphyry on the west; strike north 20 degrees west; ores carry gold and silver varying from $20 to $72 per ton.

Central Camp

Is situated between Galena and West Camp in an isolated butte. The veins here are strong and well defined, with lime on the east and porphyry on the west. They vary from 5 to 10 feet in width, and have been but little developed.

Galena Camp

Lies seven miles westerly from Oro Grande. The hill on which it lies incloses the Lucky Tom Nos. 1, 2 and 3. Vein 20 feet in width; hanging-wall stratified lime; footwall syenite; ores carbonates of lead and silver, developed by a 20 foot shaft.

(*To be Continued.*)

Working Hours.

A writer in *Chambers' Journal* says: A Turkish working day lasts from sunrise to sunset, with certain intervals for refreshment and repose. In Montenegro the day laborer begins work at 5 or 6 in the morning, knocks off at 8 for an hour, works on till noon, rests until 2, and then labors on until sunset. This is in summer. In winter he commences work at 7:30 or 8, rests from 12 to 1, and works uninterruptedly from that time to sunset. The rules respecting skilled labor are theoretically the same, but considerable laxity prevails in practice. In Servia the principle of individual convenience rules in every case.

In Portugal, from sunrise to sunset is the usual length of the working day. With field laborers and workmen in the building trade, the summer working day begins at 4.30 or 5 in the morning and ends at 7 in the evening, two or three hours' rest being taken in the middle of the day. In the winter the hours are from 7:40 to 5, with a shorter interval of repose. In manufactories the rule is 12 hours in summer and 10 in winter, with an hour and a half allowed for meals.

Eleven hours is the average day's labor in Belgium, but brewers' men work from 10 to 17 hours; breadmakers, 16; the cabinet-makers of Brussels and Ghent are often at work 17 hours a day; tramway drivers are on duty from 15 to 17 hours, with an hour and a half off at noon; railway guards sometimes know what it is to work 19½ hours at a stretch; and in the mining districts, women are often kept at truck-loading and similar heavy labor for 13 or 14 hours.

The nominal working day throughout Saxony is 13 hours, with two hours' allowance for meal-taking. In Baden the medium duration of labor is from 10 to 12 hours, but in some cases it far exceeds this, often rising to 15 hours in stoneware and china works and cotton-mills; in sawmills, to 17 hours, while the workers in sugar refineries, where the shift system is in vogue, work for 24 hours and then have 24 hours free, and in too many of the Baden factories Sunday work is the rule.

In Russian industrial establishments the difference in the working hours is sometimes extraordinary, varying from 6 to 20. It is remarkable that these great divergences occur in the same branches of industry within the inspector's district and among establishments whose produce realizes the same market-price.

PUGET SOUND LUMBER.—A lumber pile made of boards each 100 feet long and six feet in width would be an unprecedented sight in the East, says the Philadelphia *Press;* but a gentleman recently returned from a visit to the Northern Pacific ocean says that piles of timber such as that are common at the mills of Puget Sound. 'Boards 100 feet long and six feet wide, without a knot in them," he says, "are common cuts from gigantic fir trees of the Puget Sound forests." These trees grow to the enormous hight of 250 feet, and the forests are so vast that although the sawmills have been ripping 500,000,000 feet of lumber out of them every year for ten years, the spaces made by these tremendous inroads seem no more than garden patches. Puget Sound has 1800 miles of shore line, and all along this line and extending thence on both sides miles and miles farther than the eye can see, is one vast and almost unbroken forest of these enormous trees. An official estimate places the amount of standing timber in that area at 500,000 000,000 feet, or a thousand years' supply, even at the enormous rate the timber is now being felled and sawed. The timber belt covers 30,000,000 acres of Washington, an area equal to the States of Vermont, Massachusetts, New Hampshire and Connecticut.

IT IS rumored that J. J. Tobin, State Labor Commissioner, is about to commence a systematic crusade against wildcat insurance companies; that he intends by actions in Court to thoroughly ventilate the manner in which some of the assessment and endowment companies have been gulling the public. If he only succeeds in reaching the right companies he will accomplish a grand work. It has been said that some of the old-line companies have placed quite a sum of money at the disposal of Mr. Tobin in order that he may defend himself against suits that might possibly be brought against him by reason of these investigations. We are inclined to discredit this, although Mr. Tobin ought not to be made to bear the expense of defending himself while engaged in the discharge of his duties.

A Californian in Holland.

Dr. W. M. Ryer, owner of Ryer island and well known in discussion of tule-land reclamation, writes from Holland to the *Evening Bulletin* as follows:
